AM11	-26.632172°S 30.265925°E	163	1,694	In Eastern Highveld Grassland adjacent to tree edge line, 220 m south east of wetland, installed at farmstead

5 SPECIALIST FINDINGS

5.1 Ecological Baseline

The Project Area of Influence (PAOI) is situated in the Grassland Biome and comprises predominantly Eastern Highveld Grassland vegetation (Figure 1). The landscape associated with this vegetation consists of slight to moderately undulating plains with small scattered rocky outcrops. The vegetation is short, dense grassland (Mucina and Rutherford 2006). Wakkerstroom Montane Grassland occurs in the middle of the PAOI, on low mountains and undulating plains. Here the vegetation comprises short montane grassland on plateaus and flat areas. On steep, east facing slopes and in drainage areas, short forest and thicket occurs. Both vegetation types are endemic, and Eastern Highveld Grassland is classified as Vulnerable while Wakkerstroom Montane Grassland is classified as Least Concern (SANBI 2018). The PAOI includes some low hills and wetland depressions and has largely been transformed by cultivation in the west, commercial forestry in the east and urban sprawl, including extensive areas of alien invasive trees. The PAOI is in a summer rainfall region and has a cool-temperate climate with dry winters, frequent occurrence of frost and large differences in both diurnal and seasonal temperature extremes (Mucina and Rutherford 2006).

Critical Biodiversity Areas (CBA), areas of high biodiversity value that must be maintained in a natural state, are located throughout the PAOI, classified as either "CBA Irreplaceable" and "CBA Optimal" (Figure 1). The former category comprises 1) areas required to meet conservation targets and those with irreplaceability values greater than 80 %, 2) areas which represent critical linkages or pinch-points in the landscape that must remain natural, and 3) Critically Endangered ecosystems (MTPA 2014). The latter category comprises areas that are not 'irreplaceable', but they are the most optimal land configuration to meet all biodiversity targets. Ecological Support Areas (ESA), not essential for meeting biodiversity targets but important in supporting the functioning of CBAs and delivering important ecosystem services, are also located throughout the PAOI.

Parts of the PAOI fall within a National Protected Areas Expansion Strategy (NPAES) Focus area (Moist Escarpment Grasslands), targeted for protected area expansion for improved ecosystem representation, ecological sustainability and resilience to climate change. Chrissiesmeer Protected Environment and Jericho Dam Nature Reserve overlap the north and east of the PAOI respectively (Figure 1).

Bat roosting sites in the PAOI are relatively limited and unlikely to support large congregations of bats, with no underground sites (e.g., caves, mines, sinkholes) known to be present. The closest known major bat roost is approximately 70 km north of the PAOI. Although occasional ridges and rocky outcrops are features of the landscape (Mucina and Rutherford 2006) these are not extensive. Some bat species could roost in these features. Bats are likely to roost in buildings associated with farmsteads within and bordering the AoI especially Cape Serotine and Egyptian Free-tailed Bat (Monadjem et al. 2020). Trees growing at these farmsteads and elsewhere on site where they form clumps, could also provide roosting spaces for bats, even though most are alien invasive species. Completed surveys of some buildings in the of the PAOI did not reveal the presence of roosting bats and as such were assessed as being of low relative suitability. However, these could be used by bats as night-roosts (locations used by bats to feed on captured prey, or to rest between foraging bouts) and should therefore still be considered, and avoided where possible, in the spatial planning.

Sensitive features in the PAOI at which bat foraging activity may be concentrated include farm buildings where they would forage for insects attracted to lighting (Rydell 1992, Jung and Kalko 2010), dams and wetland areas (Sirami et al. 2013), within and along the edge of woodland/tree patches, and over cultivated areas (Bohmann et al. 2011, Noer et al. 2012). Free-tailed bats (Molossidae) will fly at high altitudes, and their foraging habitat is essentially all airspaces (McCracken et al. 2008, Nguyen et al. 2019).

Based on current taxonomic information and bat occurrence data, 23 species could occur within the PAOI (Table 2). The majority have a low likelihood of occurrence however the potential suite of species includes 10 high risk species, including fruit bats (Pteropodiae) and free-tailed bats (Molossidae) which are vulnerable to wind energy impacts in South Africa (MacEwan 2016, Aronson 2022).

Table 2: Bat Species Potentially Occurring within the PAOI

Common Name Species Name	Key Habitat Requirements*	Prob. Of Occurrence	Conservation Status		Wind Energy Risk[δ]
			IUCN[†]	RSA[‡]	
Natal Long-fingered bat *Miniopterus natalensis*	Temperate or subtropical species. Primarily in savannahs and grasslands. Roosts in caves, mines, and road culverts. Clutter- edge forager. Migratory.	Confirmed (5,018 passes)	LC/U	LC	High
Lessor Long-fingered bat *Miniopterus fraterculus*	Temperate species, associated with grasslands. Cave-dependant but also roosts in tunnels and mines. Habitat includes savannah bushveld, moister mistbelt and coastal forest habitats. Clutter-edge forager. Migratory.	Moderate	LC/U	LC	High
Cape Serotine *Laephotis capensis*	Arid semi-desert, montane grassland, forests, savannah and shrubland. Roosts in vegetation and human-made structures. Clutter-edge forager.	Confirmed (50,243 passes)	LC/S	LC	High
Mauritian tomb bat *Taphozous mauritianus*	Savannah woodland preferring open habitat. Roosts on rock faces, the outer bark of trees or on the outer walls of buildings under the eaves of roofs. Forages in urban areas and over cultivation. Open- air forager.	High	LC/U	LC	High
Little Free-tailed bat *Mops pumilus*	Semi-arid savannah, forested regions, woodland habitats. Roosts in narrow cracks in rock and trees but also in buildings. Open-air forager. Forages in urban areas and over cultivation.	Confirmed (1,767 passes)	LC/U	LC	High
Midas Free-tailed bat *Mops midas*	Hot low-lying savannah and woodland. Roosts in narrow cracks in rock and trees but also in buildings. Open-air forager.	Low	LC/D	LC	High
Egyptian Free-tailed bat *Tadarida aegyptiaca*	Desert, semi-arid scrub, savannah, grassland, and agricultural land. Roosts in rocky crevices, caves, vegetation, and human-made structures. Open-air forager.	Confirmed (20,995 passes)	LC/U	LC	High
Wahlberg's Epauletted fruit bat *Epomophorus wahlbergi*	Roost in dense foliage of large, leafy trees. Associated with forest and forest-edge habitats but will forage in urban environments.	Low	LC/S	LC	High
African Straw-coloured fruit bat *Eidolon helvum*	Non-breeding migrant in the PAOI.	Low	NT/D	LC	High
Egyptian Rousette *Rousettus aegyptiacus*	Distribution influenced by availability of suitable caves roosts.	Low	LC/S	LC	High
Temminck's Myotis *Myotis tricolor*	Montane forests, rainforests, coastal forests, savannah woodlands, arid thicket, and fynbos. Roosts communally in caves (and mines) and closely associated with mountainous terrain. Migratory. Clutter-edge forager.	Low	LC/U	LC	Medium-High
Welwitsch's Myotis *Myotis welwitschii*	Mainly open woodland and savannah but also high-altitude grassland, tropical dry forest, montane tropical moist forest, savannah and shrublands. Clutter-edge forager.	Low	LC/U	LC	Medium-High
Yellow-bellied house bat *Scotophilus dinganii*	Occurs throughout the Savannah Biome but avoids open habitats such as grasslands and Karoo scrub. Roosts in hollow trees and buildings. Clutter-edge forager.	Confirmed (169 passes)	LC/U	LC	Medium-High
Dusky Pipistrelle *Pipistrellus hesperidus*	Woody habitats, such as riparian vegetation and forest patches. Recorded roosting in narrow cracks in rocks and under the loose bark of dead trees. Clutter-edge forager.	Low	LC/U	LC	Medium-High
Rusty Pipistrelle *Pipistrellus rusticus*	Savannah woodland and associated with open water bodies. Roosts in trees and old buildings. Clutter-edge forager.	Low	LC/U	LC	Medium-High
Long-tailed Serotine *Eptesicus hottentotus*	Montane grasslands, marshland and well- wooded riverbanks, mountainous terrain near water. Roosts in caves, mines, and rocky crevices. Clutter-edge forager.	Confirmed (368 passes)	LC/U	LC	Medium
Egyptian Slit-faced bat *Nycteris thebaica*	Savannah, desert, arid rocky areas, and riparian strips. Gregarious and roosts in caves but also in mine adits, Aardvark holes, rock crevices, road	Medium	LC/U	LC	Low

	culverts, roofs, and hollow trees. Clutter forager.				
Geoffroy's Horseshoe bat *Rhinolophus clivosus*	Savannah woodland, shrubland, dry, riparian forest, open grasslands, and semi- desert. Roosts in caves, rock crevices, disused mines, hollow baobabs, and buildings. Clutter forager.	Medium	LC/U	LC	Low
Bushveld Horseshoe bat *Rhinolophus simulator*	Occurs in caves within areas of moist savannah, adjacent to rivers and savannah woodland, montane habitats, and coastal mosaics. Commonly associated with riparian forest and along wooded drainage lines. Roosts in caves and mines. Clutter forager.	Medium	LC/D	LC	Low
Blasius's Horseshoe bat *Rhinolophus blasii*	Savannah woodlands and are dependent on the availability of daylight roosting sites such as caves, mines, or boulder piles.Clutter forager.	Low	LC/D	NT	Low
Darling's Horseshoe bat *Rhinolophus darlingi*	Mesic woodland savannahs. Roosts in caves, boulder piles, mines, culverts, large hollow trees and disused buildings. Clutter forager.	Low	LC/U	LC	Low
Sundevall's Leaf-nosed bat *Hipposideros caffer*	Savannah, bushveld and/or coastal forests, near to rivers and other water sources. Roosts in caves, sinkholes, rock fissures, hollow trees, mines, and culverts. Clutter forager.	Low	LC/D	LC	Low
Percival's Short-eared Trident bat *Cloeotis percivali*	Savannah and woodland areas. Roosts in caves and mine tunnels. Clutter forager.	Low	LC/U	EN	Low

5.2 Pre-Construction Bat Monitoring Results

Six bat species were confirmed to occur in the PAOI (Table 2) including four species classified as high risk from wind energy development: Natal Long-fingered bat, Cape Serotine, Little Free-tailed bat, and Egyptian Free-tailed bat. All of these species have a conservation status of Least Concern (both globally and regionally) and no red data species with a higher conservation status were detected. Although these species are currently classified as Least Concern, Rodhouse et al. (2019), Davy et al. (2020) and Frick et al. (2017) have all shown that in North America, Least Concern bats may be experiencing impacts due to wind farms that could result in changes to their conservation status. The global population trend is unknown for Natal Long-fingered bat, Little Free-tailed bat, and Egyptian Free-tailed bat but stable for Cape serotine. Given the unknown population trends for some of these species and the evidence of impacts from wind farms, ongoing monitoring and adaptive management will be essential to ensure their conservation status does not deteriorate.

A total of 80,051[1] bat passes were recorded over 518 sample nights. Most activity was attributed to Cape serotine (63 %) and Egyptian free-tailed bat (27 %). These species comprise the majority of bat fatalities at South African wind farms (Aronson 2022). Natal long-fingered bat accounted for 6 % of total activity. The remaining three species (Little free-tailed bat, Long-tailed serotine and Yellow-bellied house bat) were seldomly recorded and the magnitude of their activity suggests they would be at low risk of impacts. As such, the remainder of this section focuses on impacts to Egyptian free-tailed bat, Cape serotine and Natal long-fingered bat.

Based on MacEwan et al. (2020b), Cape serotine activity was predominantly low but high activity was recorded at AM5, AM8, AM9 and AM11, in summer and autumn (Table 3). The latter two monitoring stations were located at a farm dam and at a farmstead respectively indicating higher activity in relation to these landscape features. This species was also recorded at 50 m and 90 m but the magnitude of its activity was mostly low except for at AM3-50 during March and April when its activity suggests medium risk. Based on the dataset, this species is largely predicted to be at low collision risk. However, bats in the same family (Vespertilionidae) are known to be attracted to wind turbines in the United Kingdom (Richardson et al. 2021). Thus, although the data suggest a low collision risk, the installation of wind turbines in the landscape can alter bat activity patterns. Collision risk for this species will also depend on how close turbine blades reach the ground, with risk increasing the closer the blades reach the ground (Garvin et al. 2024).

[1] Exclusive of an additional 1,491 bat passes unable to be identified to a species.

Table 3: Median number of bat passes per hour per night for Cape serotine and associated risk based on MacEwan et al. (2020b).

The timeseries data indicate a clear seasonal pattern in bat activity for the Cape serotine (Table 4), with the mean number of bat passes per hour peaking significantly during summer, reaching up to 13.66 passes per hour. This is largely driven by activity at AM11 and AM9. This heightened activity in summer likely reflects optimal weather conditions and increased prey availability. In autumn, bat activity remains relatively moderate, with values between 0.02 and 3.48 passes per hour, suggesting continued but reduced presence compared to summer. In contrast, winter and spring exhibit notably lower levels of activity, with mean passes per hour not exceeding 1.17 in spring and 0.68 in winter. This seasonal trend suggests that Cape serotine bats are minimally active during colder months, likely due to reduced foraging opportunities or temperature constraints. Additionally, within each season, there is a gradual decrease in bat passes across a night. Peak activity in summer and spring is between 19:00 and 21:00, in autumn between 18:00 and 20:00, and in winter between 17:00 and 19:00.

Table 4: Heatmap showing the mean number of bat passes per hour for Cape serotine. Colour gradient is relative and not based on thresholds.

The data showed that at 50 m and 90 m, moderate collision risk is predicted for Egyptian free-tailed bat apart from during autumn and spring when high risk is predicted (Table 5). High risk is predicted near AM11 in autumn, and AM4 and AM5 during spring. Egyptian free-tailed bat is flexible in its foraging strategy, and

it is thought that the habitat below has little influence on this species (Monadjem et al. 2020). These bats are open-air foragers based on their morphology and echolocation (Norberg and Rayner 1987) which means they tends to forage high in the air.

Table 5: Median number of bat passes per hour per night for Egyptian free-tailed bat and associated risk based on MacEwan et al. (2020b).

06:00 – 07:00	0.01	0.00	0.00	0.02

In spring, Egyptian free-tailed bat shows the highest activity levels overall, with peak passes per hour occurring around midnight (00:00 – 01:00) at 1.4 passes per hour (Table 6). This elevated activity during spring nights aligns somewhat with the Cape serotine data, where spring showed moderate activity; however, for the Egyptian free-tailed bat, spring is a clear peak season. In summer, activity for the Egyptian free-tailed bat is relatively lower compared to spring, with values not exceeding 0.57 passes per hour and generally concentrated in the earlier hours of the night. This is a notable contrast to Cape serotine, which displayed its highest seasonal activity in summer. This suggests that while the Cape serotine is more active during summer, the Egyptian free-tailed bat is less active during this period, potentially indicating differing ecological preferences or behavioural patterns. Autumn displays a moderate level of activity for the

Egyptian free-tailed bat, with values peaking around 20:00 – 21:00 at 0.78 passes per hour and then gradually decreasing through the night. This pattern is consistent with the Cape serotine, where autumn also showed moderate activity. In winter, the Egyptian free-tailed bat shows low activity levels across all hours, with peak activity reaching only 0.36 passes per hour early in the evening (18:00–19:00) and decreasing to nearly zero later at night. This aligns with the winter results for the Cape serotine bat, confirming that winter is a low-activity season for both species.

Table 7: Median number of bat passes per hour per night for Natal long-fingered bat and associated risk based on MacEwan et al. (2020b).

Activity of Natal long-fingered bat was predominantly low but high activity was recorded during spring at AM1 and AM9. Medium activity was also recorded during spring at AM5 and AM11 (Table 7). As such, overall impacts to this species are anticipated to be low, especially since activity levels at 50 m and 90 m were assessed as low based on criteria in MacEwan et al (2020b). However, this species may experience high cumulative impacts (see Section 6.3).

06:00 – 07:00	0.00	0.00	0.00	0.00

The timeseries data showed that this species exhibits relatively low and stable activity levels across all seasons, with a modest peak in autumn, where its activity reaches a maximum of 0.69 bat passes per hour between 21:00 and 22:00. This peak, though limited, suggests a slight preference for early evening hours in the autumn months. Throughout spring, summer, and winter, however, the Natal long-fingered bat maintains very low activity, rarely exceeding 0.35 passes per hour at any given time. The hourly distribution shows that this species activity slightly tapers off in the late evening and early morning hours, with a marked decline around midnight. This pattern suggests that the Natal long-fingered bat may have brief foraging periods early in the night, possibly returning to roost sites earlier than other nocturnal species. This species is migratory, and although difficult to show, the peak in activity in autumn could be suggestive of some bats (e.g. females) moving through the site to roosting sites north elsewhere in Mpumalanga or Limpopo after mating.

6 IDENTIFICATION AND ASSESSMENT OF IMPACTS

Impacts to bats that are likely to occur because of the construction, operation and decommissioning of the wind energy facility and grid connection are identified and assessed in the following section. The unit of analysis against which impacts were assessed is the local bat community and their associated habitats within the PAOI. Impacts considered for assessment include habitat modification and disturbance, displacement, fatality due to collisions with wind turbine blades, and light pollution since these are the major impacts likely to be associated with the project (Kunz et al. 2007b, Cryan and Barclay 2009, Bará and C. Lima 2024, Voigt et al. 2024). For each impact, the respective mitigation measures were categorised into those aimed at first avoiding impacts, then minimising impacts, and finally restoring areas impacted (Figure 2).

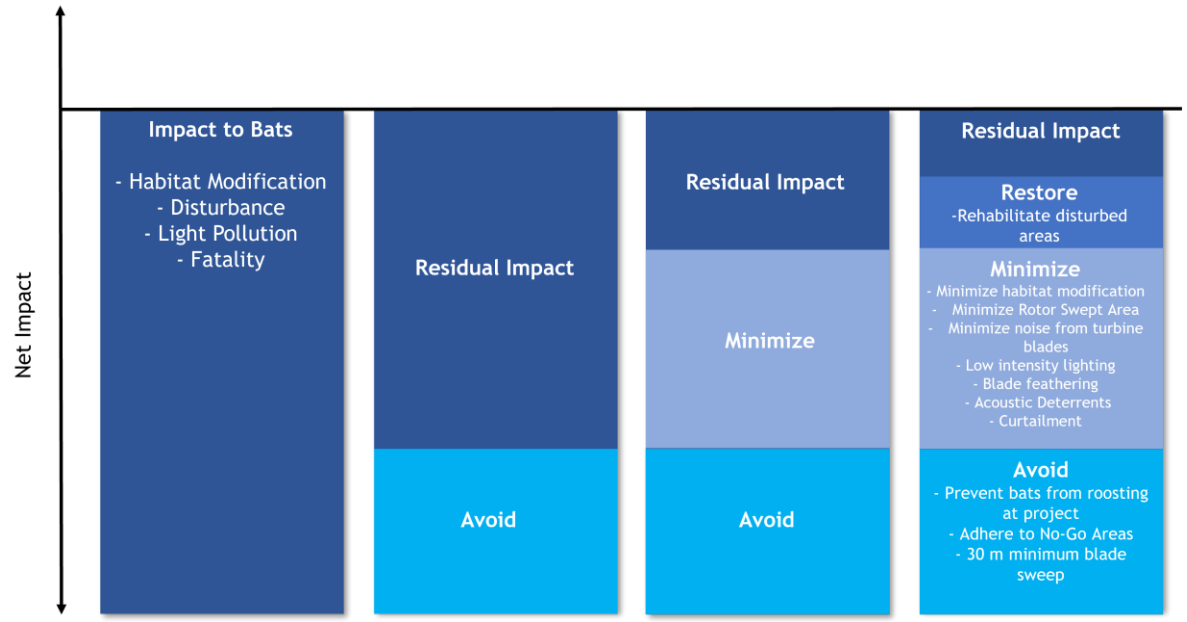

Figure 2: Mitigation Hierarchy applied to the Project with Mitigation Measures.

6.1 Wind Energy Facility

6.1.1 Construction Phase

IMPACTS

Removal of native vegetation, noise and dust generated during construction activities, and the presence of new infrastructure in the landscape, will negatively and indirectly impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement (Kunz et al. 2007b, Millon et al. 2015, Millon et al. 2018, Bennun et al. 2021, Leroux et al. 2022, Tolvanen et al. 2023).

Construction of WEF infrastructure could result in destruction (direct impact) of bat roosts (rocky crevices, buildings) and disturbance (indirect impact) of bat roosts potentially resulting in roost abandonment. Bat mortality can occur if roosts which contain bats are destroyed. Installation of new infrastructure in the landscape (e.g., buildings, turbines, road culverts) can provide new roosting spaces for some bat species, attracting them to areas with wind turbines and potentially increasing the likelihood of collisions.

Mitigation (Avoid)

Habitat modification impacts can be avoided by buffering habitat and landscape features (Table 8) that bats use to spatially limit the potential for bats to interact with project infrastructure, and to avoid impacting key bat habitat (Barré et al. 2018, Leroux et al. 2022). All key habitat features were buffered by 200 m as per best practise (Rodrigues 2015, MacEwan et al. 2020b).

To align with regional conservation and integrated development planning, the Mpumalanga Biodiversity Sector Plan Handbook (MTPA 2014) was consulted to guide spatial risk in the AoI. The intention was to align biodiversity conservation policy objectives with renewable energy policy objectives, attempting to minimize trade-offs between conflicting goals (Jackson 2011, Gasparatos et al. 2017). The handbook includes a map of terrestrial areas that are important for conserving biodiversity and ecological processes – Critical Biodiversity Areas (CBAs) and Ecological Support Areas (ESAs) respectively.

CBA Irreplaceable Areas were categorised as No-Go (Table 8) because the conservation goals for these areas are to maintain them in a natural state with no loss of ecosystems, functionality or species, and with no flexibility in land-use options (MTPA 2014). CBA optimal and areas with Highveld grassland were classified as high risk. Although the primary objective of the CBA optimal areas is to maintain these spaces in a natural state with no loss of ecosystems, functionality or species, some flexibility in land-use options is permitted (MTPA 2014), therefore these areas must be avoid as much as possible. The remaining areas were assigned low or medium risk where all infrastructure development should be prioritized. These included modified land, areas with invasive alien trees (plantations), ESA, and other Natural Areas (Table 8). Similarly, in ecological supports areas (ESAs), the objective is to maintain habitats in a natural, or near-natural, state with limited loss of ecosystems or functionality. Hence, these areas were classified as medium risk, permitting the siting of turbines in these spaces.

All turbines will be subjected to a post-construction bat fatality monitoring program which will monitor residual impacts at turbines located in CBA optimal and ecological support areas, as well as turbines in low-risk areas. The results of this monitoring will inform management actions where needed to ensure alignment with the MTPA objectives to limit impacts to biodiversity.

Table 8: Features used to assign spatial risk categories in the AoI for bats (Chiroptera)

Risk Level			
Low	Medium	High	No-Go
Heavily modified land	NPAES	CBA Optimal	CBA Irreplaceable Areas
Moderately modified land	ESA Landscape corridor	Highveld Grassland	Minor Watercourses (50 m buffer)
Cleared Invaded	ESA Local corridor		Farm Dams (200 m buffer)
Transformed	Other Natural Areas		Pan depressions (200m buffer)
Plantation/Invaded	Montane Grassland		Houses (200 m buffer)
			Buildings (200 m buffer)
			Seeps (200 m)
			CVB Wetlands (200 m)
			Rivers with floodplains (200 m buffer)
			Rocky Outcrops (200 m buffer)
			Protected Area (200 m buffer)

No infrastructure (including O&M buildings) may be placed within buffered No-Go areas (Figure 3). However, road infrastructure may need to be routed through sensitive areas for practical reasons. Existing road networks should be used as much as possible in these cases to limit the creation of additional roads which have known impacts on wildlife (Perumal et al. 2021).

One of the O&M buildings is located within a No-Go buffer zone designated due to the presence of a

wetland (Figure A). This building must be relocated, or additional mitigation measures applied to this building. Specifically, these additional mitigation measures include: minimizing the footprint of the building, constructing the building as far as possible away from the wetland within the identified footprint polygon, the use of any lighting at night is prohibited to prevent attracting bats, and to prevent light pollution.

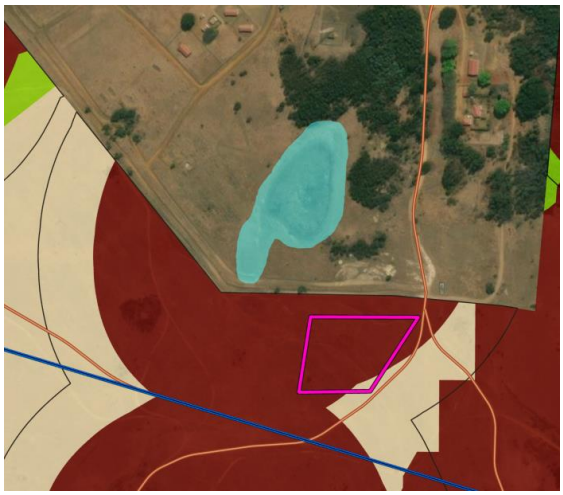

Figure A: O&M Building within a No-Go buffer (dark red) must be relocated or additional mitigation measures applied.

To avoid bats roosting in new project infrastructure, all buildings must be properly sealed. If bats colonize these spaces, a suitably qualified bat ecologist must be engaged to remove them.

Disturbance effects can be avoided by restricting construction activities to daylight hours (i.e., no construction at night) and avoiding blasting near rocky outcrops.

Mitigation (Minimize and Restore)

Modification and disturbance of bat habitat is likely to have species specific effects depending on species foraging guild, season, and distance to wind turbines (Barré et al. 2018, Leroux et al. 2022). For example, clutter edge species (e.g., Cape serotine) are more likely to be impacted by habitat modification given their greater association with physical habitat features compared to high-flying species (e.g., Egyptian free-tailed bat). As such, buffers may not be effective to fully remove all impacts.

Beyond avoidance, measures to minimize further impacts include minimizing the clearing of vegetation, minimizing disturbance and destruction of rocky outcrops, and applying good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. Where native trees, rocky outcrops or buildings need to be removed (although this must be avoided), these features must be examined by a suitably qualified bat ecologist before construction commences to search for roosting bats. Following construction, all areas disturbed must be rehabilitated through native species planting within all areas under the projects control.

IMPACT PHASE: CONSTRUCTION					
Nature of the impact: MODIFICATION & DISTURBANCE OF BAT HABITAT (ROOSTING, FORAGING, COMMUTING)					
Description of impact Removal of native vegetation, noise and dust generated during construction activities, and the presence of new infrastructure in the landscape, will negatively and indirectly impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement. Construction of WEF infrastructure could result in destruction and/or disturbance to bat roosts, and inadvertently provide new roosting spaces for some bat species in risky locations.					
	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)
Without Mitigation	1	1	3	2	2
With Mitigation	1	1	2	1	1

Significance Calculation	Without Mitigation	With Mitigation
S=(E+D+R+M)*P	Low Negative Impact (14)	Low Negative Impact (5)
Was public comment received?	No	
Has public comment been included in mitigation measures?	No, no comments received	
Mitigation measures to reduce residual risk or enhance opportunities: - Limit potential for bats to roost in project infrastructure (e.g., buildings, turbines) by ensuring they are properly sealed such that bats cannot gain access. - No construction activities at night. - No placement of infrastructure (except roads) in no-go areas. - Relocate the O&M building within a No-Go area (Figure A) or, minimize the footprint of the building, construct the building as far as possible away from the wetland within the identified footprint polygon, do not use any lighting at night. - No blasting near rocky crevices. - Minimize clearing of native vegetation - Minimize disturbance and destruction of rocky outcrops, trees and buildings, and where this is required, these features should be examined for roosting bats. - Apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).		
Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).	

6.1.2 Operational Phase

IMPACTS

Bat mortality (direct impact) through collisions with wind turbine blades is the principal impact of wind energy facilities on bats during operation of the facility (Cryan and Barclay 2009, Arnett et al. 2016, Voigt et al. 2024). Displacement of bats from their preferred areas may also occur due to turbine noise emissions (Ellerbrok et al. 2024, Voigt et al. 2024).

Mitigation (Avoid)

Collisions can be avoided by not placing wind turbines in the vicinity of bat habitats which for bats includes both physical landscape features themselves (near wetlands, vegetation etc.) and open airspace away from these features (Schnitzler et al. 2003). Risk of collision impact is related to bat morphology with fast flying, open-air species more likely to be impacted than low-flying species who forage closer to the ground, in edge spaces near vegetation, or in dense cluttered spaces (Schnitzler et al. 2003, Thaxter et al. 2017, Aronson 2022). Impacts to low-flying species can be further avoided by ensuring blades do not sweep close to ground level (Figure 4).

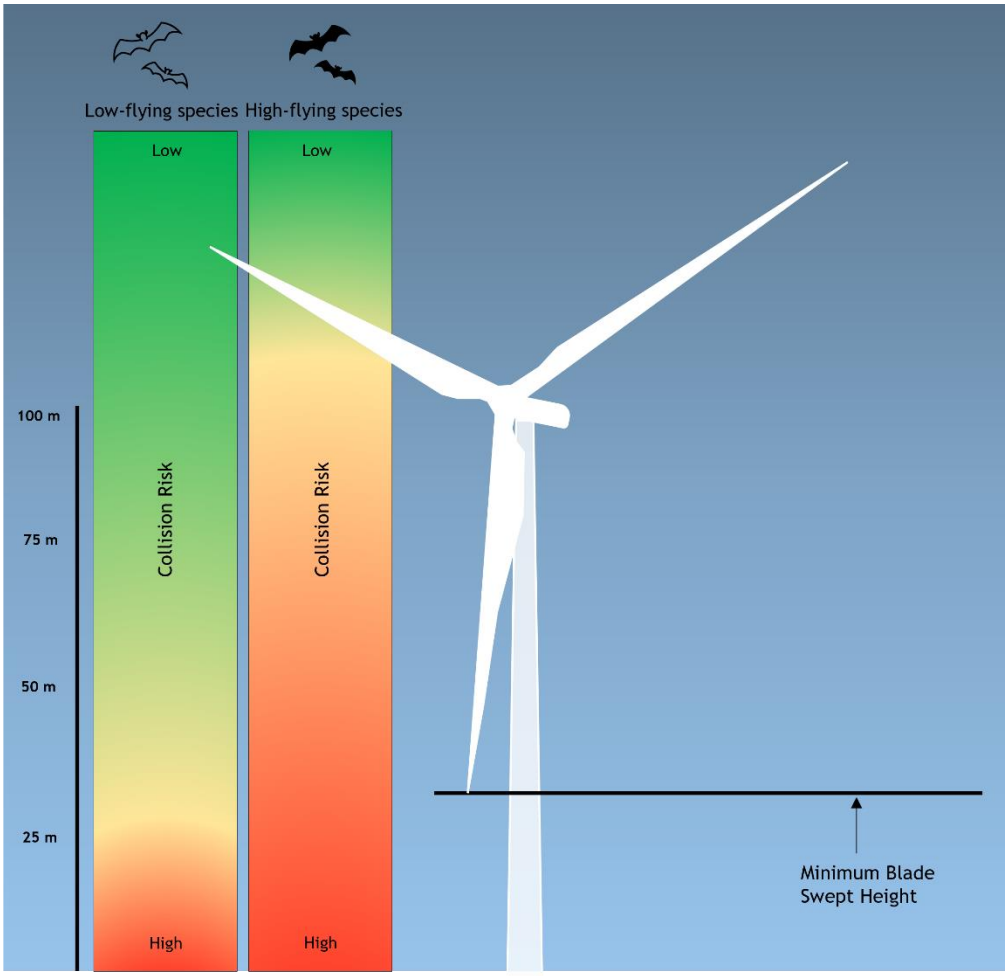

Figure 4: Conceptual Framework used to differentiate risk between low and high-flying bat species and the relationship with turbine size.

The species principally at collision risk from the proposed project are Cape serotine and Egyptian free-tailed bat since other species were recorded less often. High risk was identified for Cape serotine at ground level (represented by 10 m) at some locations (Table 3) but generally low risk at height (above 50 m). Activity is likely to decrease exponentially between these two heights (Wellig et al. 2018) meaning risk would decrease from high at 10 m to low at 50 m and above. The size of the rotor swept area should account for this because the lower the blades sweep the ground, the higher risk they will present to bats (Garvin et al. 2024). It is therefore recommended to maintain a minimum blade sweep of 30 m to avoid collision impacts as much as possible. There is limited published emperical evidence for this specific height but based on the activity of Cape serotine this is likely to be a reasonable height were risk would reduce from high to moderate or low.

Collision impacts can also be avoided by not installing wind turbines within or adjacent to key bat habitats, and adhering to the No-Go buffers (Figure 3). To ensure no parts of the wind turbines, including the blade tips, intrude into bat buffers, all 200 m buffers were adjusted (increased by 49 m) to account for the blade length and hub height of the assessed turbine in line with Mitchell-Jones and Carlin (2014) and based on the following equation:

$$b = \sqrt{(buffer + bl)^2 - (hh - fh)^2}$$

[Eq. 1]

$$b = \sqrt{(200 + 91)^2 - (150 - 0)^2}$$

$$b = 249\ m$$

Where:
b = adjusted/blade tip buffer
buffer = 200 m
bl: Turbine blade length = 91 m
hh: Hub height = 150 m
fh: Feature height = 0 m

The specific turbine height assessed in this report has a 150 m hub height and 91 m blade length, resulting in a minimum blade sweep of 59 m. Should the turbine size change, the adjusted/blade tip buffers must be updated to account for any changes in the hub height or blade length. No turbines are within buffered areas and hence the turbine layout is acceptable in its current form (Figure 3).

Mitigation (Minimize and Restore)

For some high-flying species such as Egyptian free-tailed bat, the habitat or land use below does not generally influence their activity (Monadjem et al. 2020) which makes habitat based mitigations (e.g., buffers) less effective. This species was recorded at 50 m and 90 m, where median activity levels suggest high risk during autumn and spring (Table 5). Mitigation to avoid impacts to higher-flying species should include the choice of turbine design since this has the potential to influence bat fatality (Barclay et al. 2007) but the impact of turbine size on bat fatality is poorly understood. Generally, impacts to high-flying species should be avoided by limiting the size of the rotor swept area as much as practicable since they are active across much of the rotor swept zone.

However, due to the characteristics of the species present on site, i.e., high risk, open-air foraging species, residual impacts could occur since there is still likely to be a high degree of risky airspace even with a minimized rotor swept area. In addition, some bats may be attracted to turbines (Horn et al. 2008, Cryan and Barclay 2009, Richardson et al. 2021, Guest et al. 2022, Leroux et al. 2022) once installed and operational and therefore additional mitigation measures would be needed to minimize impacts.

The first additional mitigation measure to minimize residual collision impacts is the use of blade feathering to prevent free-wheeling of blades below the turbine cut-in speed. This has been shown to reduce bat fatality with the benefit of not impacting on energy production (Young et al. 2011, Good et al. 2012).

During operation, bat fatality monitoring must be undertaken to search for bat carcasses beneath wind turbines to measure the residual impact of the WEF on bats for a minimum of two years (Aronson et al. 2020). Mitigation measures that are known to further minimize bat fatality if needed based on the fatality monitoring results include curtailment and/or acoustic deterrents (Arnett et al. 2013, Romano et al. 2019, Weaver et al. 2020). These techniques must be used if post-construction fatality monitoring indicates that species fatality thresholds have been exceeded (MacEwan et al. 2018) to minimize impacts, maintain the impacts to bats within acceptable limits of change and prevent declines in the impacted bat population. The bat fatality thresholds for the project were determined based on area of influence of the turbines of 4,774 hectares. This was based on a minimum convex polygon around all turbines, plus an additional buffer around this space of 110 m corresponding to the turbine blade length. Based on the bat fatality threshold for the Highveld Grasslands ecoregion (MacEwan et al. 2018), the bat fatality threshold for the Sheepmoor project is 38 bats per least concern species.

According to the threshold guidance (MacEwan et al. 2018), should the annual fatality threshold be exceeded, curtailment and/or acoustic deterrents must be used to reduce fatality levels to below the threshold. For frugivorous bats, conservation important or rare/range restricted bats, i.e., Species of Special Concern (SSC), the annual fatality threshold is 1 individual. The likelihood of SSC's being present on site is low (Table 2).

A Biodiversity Management Plan (BMP) for bats must be developed by a bat ecologist before commencement of operation which includes the post-construction fatality monitoring plan design, fatality thresholds calculations and rationale, and an adaptive management response plan that provides a timeous action pathway for mitigation (e.g. curtailment or deterrents) should fatality thresholds be exceeded. Smart curtailment approaches which shut down turbines based on real time bat acoustic activity data are favoured over blanket curtailment because these will be less disruptive to turbine operation.

Since displacement of bats is likely driven by turbine noise, this can be minimized by serration of the back edges of the blade, by using a low-noise blade airfoil design or with blade trailing-edge brushes (Bošnjaković et al. 2024; Ellerbrok et al. 2024).

IMPACT PHASE: OPERATION					
Nature of the impact: BAT FATALITY					
Description of impact Bat mortality (direct impact) through collisions and/or barotrauma with wind turbine blades is the principal impact of wind energy facilities on bats.					
	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)

Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: - No placement of turbines and infrastructure (apart from roads and the OHL) within no-go areas - Maintain a minimum blade sweep of 30 m to avoid impacts to lower flying bats such as clutter-edge species (e.g., Cape serotine, Natal long-fingered bat). - Minimize the rotor diameter - Feather blades to prevent free-wheeling below the turbine cut-in speed - Implement post-construction fatality monitoring and apply smart curtailment or deterrents if fatality thresholds are exceeded.					
Residual impact	Curtailment and deterrents can successfully reduce bat fatality (Arnett 2011, Arnett et al. 2016, Weaver et al. 2020), but not completely. Through the application of fatality thresholds, residual impacts should be minimized.				

IMPACT PHASE: OPERATION					
Nature of the impact: DISPLACEMENT					
Description of impact Avoidance of wind turbines by bats, in some cases over several hundred meters distance, has been observed for various species in different habitats, including farmland, resulting in displacement impacts (Tolvanen et al. 2023, Voigt et al. 2024). Displacement, likely caused by wind turbine operation (e.g., wake turbulences and noise emissions), tends to increase with the number and size of turbines.					
	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)
Without Mitigation	3	4	3	3	3

Mitigation measures to reduce residual risk or enhance opportunities:					

- Reduce turbine noise emissions by serration of the back edges of the blade, by using a low-noise blade airfoil design or with blade trailing-edge brushes (Bošnjaković et al. 2024; Ellerbrok et al. 2024).	
Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).

6.1.3 Decommissioning Phase

IMPACTS

Impacts during the decommissioning phase will be indirect and involve disturbance to bats through excessive noise and dust, and damage to vegetation.

Mitigation (Avoid)

Disturbance effects can be avoided by restricting decommissioning activities to daylight hours (i.e., no works at night).

Mitigation (Minimize and Restore)

Disturbance can be minimized by applying good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning works. All areas disturbed must be rehabilitated through native species planting within all areas under the projects control.

IMPACT PHASE: DECOMMISSIONING					
Nature of the impact: DISTURBANCE OF BATS

Mitigation measures to reduce residual risk or enhance opportunities: - No decommissioning activities at night. - Apply good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning activities. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).					
Residual impact	Residual impacts are likely to be minor since ceasing project activities on site is likely to benefit bats.				

6.2 Grid Connection

6.2.1 Construction Phase

The direct impact of grid connection infrastructure is collisions with powerlines. Insectivorous bats are unlikely to collide with powerlines since they can avoid these obstacles using echolocation but fruit bats do collide with powerlines (Tella et al. 2020). The likelihood of occurrence for fruit bats species in the AoI

is low (Table 2). Indirect impacts include loss of habitat to construct substations and OHL pylons, and ecological light pollution (Longcore and Rich 2004).

IMPACT PHASE: CONSTRUCTION					
Nature of the impact: MODIFICATION & DISTURBANCE OF BAT HABITAT (ROOSTING, FORAGING, COMMUTING)					
Description of impact Vegetation clearing for grid connection infrastructure (access roads, substation buildings, pylons), as well as noise and dust generated during the construction phase, will impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement (Kunz et al. 2007b, Millon et al. 2018, Bennun et al. 2021). This impact is likely to have species specific effects; clutter edge species (e.g., Cape serotine) are more likely to be impacted by habitat modification given their greater association with physical habitat features compared to high-flying species (e.g., Egyptian free-tailed bat). Construction of grid connection infrastructure could result in destruction (direct impact) of bat roosts (trees, buildings) and disturbance (indirect impact) of bat roosts potentially resulting in roost abandonment. Bat mortality can occur if roosts which contain bats are destroyed. Installation of new infrastructure in the landscape (e.g., buildings) can inadvertently provide new roosting spaces for some bat species, attracting them to areas with wind turbines and potentially increasing the likelihood of collisions.					
	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)
Without Mitigation	1	1	3	2	2
With Mitigation	1	1	2	1	1
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Low Negative Impact (14)			Low Negative Impact (5)	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: - Limit potential for bats to roost in project infrastructure (e.g., buildings) by ensuring they are properly sealed such that bats cannot gain access. - No construction activities at night. - No placement of pylons within 200 m of key habitat features specifically including buildings, dams/wetlands, and rivers/streams. The OHL itself is permitted to cross over No-Go Areas for practical routing reasons but pylon positions must avoid No-Go Areas where feasible. Therefore the maximum possible span should be implemented to avoid the sensitive area while ensuring the technical feasibility of the development. - No blasting near rocky crevices. - The construction compounds, laydown areas, and batching plants must avoid No-Go areas. - Minimize clearing of native vegetation - Minimize disturbance and destruction of rocky outcrops, native trees and buildings, and where this is required, these features should be examined for roosting bats. - Apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).					
Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).				

6.2.2 Operational Phase

IMPACT PHASE: OPERATION
Nature of the impact: LIGHT POLLUTION

Description of impact
Construction of grid infrastructure will increase ecological light pollution from artificial lighting associated with the substation and other operational and maintenance buildings. Light pollution can alter ecological dynamics (Horváth et al. 2009). Lighting attracts and can cause direct mortality of insects, reducing the prey base for bats, especially bat species that are light-phobic. These species may also be displaced from previous foraging areas due to lighting. Other bat species forage around lights, attracted by higher numbers of insects. This may bring these species into the vicinity of the project and indirectly increase the risk of collision with wind turbines.

	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)
Without Mitigation	3	4	3	3	3
With Mitigation	3	4	2	2	2

Significance Calculation	Without Mitigation	With Mitigation
S=(E+D+R+M)*P	Moderate Negative Impact (39)	Low Negative Impact (22)
Was public comment received?	No	
Has public comment been included in mitigation measures?	No, no comments received	

Mitigation measures to reduce residual risk or enhance opportunities:
- No placement of substations and operational and maintenance buildings within no-go areas. - Avoid excessive lighting - Use of motion-sensor lighting, avoid sky-glow by using hoods and downward facing lighting, increase spacing between lighting units, and use low pressure sodium lights (Rydell 1992, Stone 2012).

Residual impact	Given the limited extent of light pollution currently in the region, the application of the above mitigation measures is likely to result in minor residual impacts.

6.2.3 Decommissioning Phase

IMPACT PHASE: DECOMMISSIONING
Nature of the impact: DISTURBANCE OF BATS
Description of impact Impacts during the decommissioning phase will be indirect and involve disturbance to bats through excessive noise and dust, and damage to vegetation.

	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)
Without Mitigation	1	1	3	3	3
With Mitigation	1	1	2	2	2

Significance Calculation	Without Mitigation	With Mitigation
S=(E+D+R+M)*P	Low Negative Impact (24)	Low Negative Impact (12)
Was public comment received?	No	
Has public comment been included in mitigation measures?	No, no comments received	

Mitigation measures to reduce residual risk or enhance opportunities:
- No decommissioning activities at night. - Apply good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning activities. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).

Residual impact	Residual impacts are likely to be minor since ceasing project activities on site is likely to benefit bats.

6.3 Cumulative Impacts

For the purposes of the cumulative impact assessment (CIA), cumulative impacts are defined as the total impacts resulting from the successive, incremental, and/or combined effects of a project when added to other existing, planned and/or reasonably anticipated future projects, as well as background pressures (IFC 2013). The project considered here is the Sheepmoor Wind Energy Facility. The goal of this assessment is to evaluate the potential resulting impact to the vulnerability and/or risk to the sustainability of the bat species affected (IFC 2013).

6.3.1 Step 1: VECs and spatial-temporal boundary

Following guidance in IFC (2013), the first step in the CIA was to determine the Valued Environmental Components (VECs), the bat species most likely to be affected by cumulative impacts, and the temporal and geographic scope of the analysis.

Of the species recorded in the PAOI during the acoustic monitoring, and based on bat distribution records (ACR 2020), Cape serotine (*Laephotis capensis*), Natal long-fingered (*Miniopterus natalensis*) and Egyptian free-tailed bat (*Tadarida aegyptiaca*) are most likely to be impacted cumulatively. This is because they are the most widespread bat species in South Africa (Monadjem et al. 2020), classified as high risk species to wind energy impacts (MacEwan et al. 2020b), the most impacted by operating wind energy facilities in the country (Aronson 2022).

The temporal time frame over which cumulative impacts are considered was 25 years, the typical lifespan of a renewable energy facility. However, cumulative effects could extend beyond this timeframe if development of the cluster of three projects is phased over time.

The Ecologically Appropriate Area of Analysis (EAAA) for the assessment was determined by considering the ecology of the three VECs.

The acoustic monitoring confirmed the presence of Natal long-fingered bat in the PAOI, a migratory species which moves seasonally between winter hibernacula and summer maternity cave roosts in South Africa (van der Merwe 1975, Miller-Butterworth et al. 2003). In north-eastern South Africa, where the proposed development is planned, van der Merwe (1975) showed migration between maternity caves in Limpopo and hibernacula caves in Gauteng/North-West undertaken by pregnant females (who later return south with weaned pups), with caves separated by 150 km at least. Males typically undertake shorter movements (> 60 km) between various highveld caves (van der Merwe 1975). This migration increases the potential that these bats will encounter wind turbines or be displaced by them (Millon et al. 2018), especially if these are placed along migratory routes. Although these movements are typically north-south, Pretorius et al. (2020) suggest that movement could also occur east-west between Gauteng and a maternity cave in Sudwala, Mpumalanga, a distance of approximately 250 km. Although additional research is needed to better understand long and short distance movements of Natal long-fingered bat in South Africa more precisely, given the numerous roost sites (both caves and mines) in Mpumalanga and body of work already demonstrating or suggesting migratory behavior in the north-east of the country between these sites, it is reasonable that cumulative impacts of wind energy may impact this species at large scales and hence cumulative impacts need to be assessed accordingly. Based on van der Merwe (1975), a 150 km radius around the PAOI was therefore defined as EAAA1 (Figure 5), especially since cumulative impacts should be evaluated across scales potentially affected species are likely to occur (Voigt et al. 2012, Lehnert et al. 2014).

The remaining VECs are not migratory and hence a second, smaller EAAA was used. Data on the spatial ecology of the Egyptian free-tailed bat and Cape serotine, specifically the sizes of their foraging or community ranges, are not available. Data from European free-tailed bat, *Tadarida teniotis*, in Portugal (Marques et al. 2004) and Serotine bat, *Eptesicus serotinus*, in England (Robinson and Stebbings 1997) were used as surrogates. Feeding areas for some *T. teniotis* individuals were over 30 km from their roost while the maximum distance between *E. serotinus* feeding areas was over 41 km.

Cumulative impact assessment in South African typically consider developments within a radius of 35 km which therefore is potentially in line with the movement ecology of the two VECs. Hence the EAAA2 was a 35 km radius around the PAOI.

6.3.2 Step 2: Other Activities and External Drivers

The second step in the CIA was to identify other past, existing, or planned activities within the EAAA1 and EAAA2 and to assess the external influences and stressors on the three VECs. With reference to the Renewable Energy Application database (Q2, 2024), currently one other wind energy project is located within the EAAA2, namely the Emvelo WEF. Approximately 35 other development projects are located within EAAA1 (Figure 5). Given that EAAA1 also includes a Renewable Energy Development Zone (REDZ), it is reasonable to expect further development over the 25-year period considered in this assessment.

There are no documented major past threats to Egyptian free-tailed bat and Cape serotine or current threats to them other than renewable energy (Child et al. 2016). Egyptian free-tailed bats can also be threated indirectly by roost disturbance, especially caves. This CIA considers renewable energy the primary impact to these VECs. Natal long-fingered bat is locally threatened in parts of its range by habitat loss resulting from conversion of land to agricultural use, incidental poisoning with insecticides, loss of prey base, and the disturbance of roosting and maternity caves (Child et al. 2016).

6.3.3 Step 3: Baseline Status of VECs

Egyptian free-tailed bat is very widely distributed, locally common and recorded from many protected areas in South Africa however, although the population is stable, the population size is unknown (Child et al. 2016). It is classified as Least Concern nationally and globally. This species is present in the PAOI and based on its activity levels, it is at high risk of collision during autumn and spring (Table 5). It is flexible in its habitat requirements and one reason for its wide distribution is its affinity to roost in buildings or other man-made structures (Monadjem et al. 2020).

Cape serotine is also widely distributed in South Africa with a large population and hence is classified as Least Concern nationally and globally. However, it is possible that this species comprises a complex of closely related species (Monadjem et al. 2020). The population trend is stable, but the population size is unknown. Although this species is present in the PAOI its activity levels suggest low risk of collision (Table 3) although no data between 10 m and 50 m were recorded on site to verify this. This species was recorded at 50 m, so it is reasonable to assume some level of risk between 10 m and 50 m. Cape serotine is also flexible in its habitat requirements and its use of buildings and other anthropogenic structures as roosts has possibly led to its numbers increasing.

Natal long-fingered bat is a common and widespread species, classified as Least Concern nationally and globally with a stable national population, but it may be experiencing local declines (Child et al. 2016). The size of the national population is unknown but this species roosts in large colonies; De Hoop Guano cave in the Western Cape hosts approximately 200,000 individuals, and in the Highveld, some caves may contain up to 4000 individuals (Child et al. 2016). Activity levels of this species in the AoI were relatively low and this species was seldomly recorded in the rotor swept area but high activity was recorded closer to ground level in spring (Table 7).

6.3.4 Step 4: Assess Cumulative Impacts on VECs

The key potential impacts that could affect the long-term sustainability and/or viability of the three VECs in EAAA1 and EAAA2 are collisions with wind turbines. This may lead to local extinctions and fragmentation of the national population since bats have low reproductive rates (Barclay and Harder 2003). Other impacts may include displacement from foraging and commuting areas, and along migration routes, due to wind turbines (Millon et al. 2018, Leroux et al. 2022).

6.3.5 Step 5: Assess Significance of Predicted Cumulative Impacts

Rodhouse et al. (2019), Davy et al. (2020) and Frick et al. (2017) have all shown that in North America, Least Concern bats may be experiencing impacts due to wind farms that could result in changes to their conservation status. This may be a future scenario for widespread, common Least Concern bats species in South Africa. As such, the significance of cumulative impacts is assessed as High without mitigation. The application of mitigation measures is anticipated to reduce the overall cumulative impact of the project to a moderate level.

Nature of the impact: CUMULATIVE IMPACTS					
Description of impact The total impacts resulting from the successive, incremental, and/or combined effects of the project when added to other existing, planned and/or reasonably anticipated future projects, as well as background pressures.					
	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)
Without Mitigation	3	4	3	4	5
With Mitigation	3	4	2	3	3
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	High Negative Impact (70)			Moderate Negative Impact (36)	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: The mitigation measures proposed in this report (buffering key habitats used by bats, use of appropriate lighting technology, blade feathering, and using smart curtailment and/or acoustic deterrents) should be applied to all future projects so that there is a collective management responsibility (IFC 2013).					
Residual impact	Curtailment and deterrents can successfully reduce bat fatality (Arnett 2011, Arnett et al. 2016, Weaver et al. 2020), but not completely. Through the application of fatality thresholds across all projects in the cumulative impact area, residual impacts should be minimized.				

6.3.6 Step 6: Management of Cumulative Impacts

Management interventions for bats at operating wind farms in South Africa are guided by fatality thresholds, which aim to mitigate population-level impacts. These thresholds are set below the rate at which populations could decline due to anthropogenic pressures (MacEwan et al. 2018). For this project, thresholds have been established, and similar measures should be applied to all future wind energy developments. In theory, if each development implements thresholds and appropriate mitigation measures when exceedances occur, the EAAA1 and EAAA2 VEC populations should not decline due to wind energy impacts.

The mitigation measures proposed in this report (buffering key habitats used by bats, use of appropriate lighting technology, blade feathering, and using smart curtailment and/or acoustic deterrents) should be applied to all future projects so that there is a collective management responsibility (IFC 2013).

7 ENVIRONMENTAL MANAGEMENT PROGRAMME

Objective: Avoid and minimize modification of bat habitats

Project component/s	All project infrastructure
Potential Impact	Vegetation clearing for project infrastructure, as well as noise, dust and pollution generated during construction activities, will impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement. Construction of WEF infrastructure could result in destruction and/or disturbance to bat roosts and inadvertently provide new roosting spaces for some bat species in risky locations.
Activity/risk source	All construction activities and associated activities (e.g., driving)
Mitigation: Target/Objective	1. Avoid potential for bats to roost in project infrastructure (e.g., buildings, and turbines) 2. Minimize disturbance to bats 3. Minimize habitat loss 4. Minimize displacement of bats

Mitigation	Responsibility	Timeframe
1. Ensure all project infrastructure (e.g., buildings, and turbines) is properly sealed such that bats cannot gain access. 2. No construction activities at night, apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste). 3. No placement of infrastructure (except roads and OHL) within No-Go areas. 4. Minimize clearing of native vegetation, minimize disturbance and destruction of farm buildings on site, minimize removal of native trees. Rehabilitate and enhance all areas disturbed during construction, (including aquatic habitat). 5. Reduce turbine noise emissions by serration of the back edges of the blade, by using a low-noise blade airfoil design or using blade trailing-edge brushes.	Project Developer Contractor	During design and planning phase and throughout construction phase

Performance Indicator	No bat roosts are destroyed No bats colonise new project infrastructure for roosting No infrastructure in No-Go areas (except roads and OHL) All areas disturbed during construction are rehabilitated
Monitoring	An appointed ECO must inspect all new project infrastructure, in conjunction with or via training from a bat ecologist, to ensure bats cannot gain access. ECO to ensure compliance with good construction abatement control practices. ECO must ensure no infrastructure is placed in No-Go areas (see Figure 3). If a bat roost is encountered during construction, the ECO must consult a bat ecologist to determine appropriate actions. ECO to ensure all disturbed areas are rehabilitated. ECO to ensure turbine blades have appropriate noise-reduction technology.

Objective: Avoid and minimize bat fatality	
Project component/s	Wind turbines
Potential Impact	Bat mortality through collisions with wind turbine blades.
Activity/risk source	Operating Wind Turbines
Mitigation: Target/Objective	1. Avoid bat fatalities through turbine layout design and turbine dimensions 2. Minimize bat fatalities using smart curtailment or deterrents during operation

Mitigation	Responsibility	Timeframe
1. No placement of turbines in No-Go Areas (Figure 3). 2. Maintain a minimum blade sweep of 30 m to avoid impacts to lower flying bats such as clutter-edge species (e.g., Cape serotine, Natal long-fingered bat). 3. Minimize the rotor diameter 4. Feather blades to prevent free-wheeling below the turbine cut-in speed 5. Implement fatality monitoring throughout the operational phase 6. Apply smart curtailment or deterrents if fatality thresholds are exceeded. Annual fatality threshold per Least Concern species = 38 individuals. Annual fatality threshold per Species of Special Concern = 1 individual for each of [African Straw-coloured fruit bat, Wahlberg's Epauletted fruit bat, Percival's Short-eared Trident bat, Blasius's Horseshoe bat, Egyptian Rousette and Lessor Long-fingered bat].	Project Developer Operator	BMP developed prior to operation. BMP active throughout operation phase.

Performance Indicator	≤ 38 individuals per Least Concern species killed annually ≤ 1 individual per Species of Special Concern killed annually
Monitoring	ECO must ensure no turbines are placed in No-Go areas, including the blade tips (Figure 3). ECO must ensure the dimensions of the final selected turbine adhere to requirements (A minimum blade sweep of 30 m). A Biodiversity Management Plan (BMP) for bats must be developed which includes the design of a post-construction fatality monitoring program (PCFM) for bats, and an adaptive management response plan that provides an escalating scale of mitigation should fatality thresholds be exceeded. ECO to ensure adherence to BMP and any mitigation measures implemented

Objective: Reduce impact of light pollution	
Project component/s	All project infrastructure
Potential Impact	Construction of project infrastructure will increase ecological light pollution from artificial lighting associated with turbines, the substation and other operational and maintenance buildings. Light pollution can alter ecological dynamics (Horváth et al. 2009, Bará and C. Lima 2024). Lighting attracts and can cause direct mortality of insects, reducing the prey base for bats, especially bat species that are light-phobic. These species may also be displaced from previous foraging areas due to lighting. Other bat species forage around lights, attracted by higher numbers of insects. This may bring these species into the vicinity of the project and indirectly increase the risk of collision with wind turbines.
Activity/risk source	Light sources from project infrastructure
Mitigation: Target/Objective	1. Avoid light pollution 2. Minimize light pollution

Mitigation	Responsibility	Timeframe

1. No placement of infrastructure within No-Go areas (Figure 3). 2. Use motion-sensor lighting, avoid sky-glow by using hoods and downward facing lighting, increase spacing between lighting units, and use low pressure sodium lights	Project Developer Operator	During design and planning phase and throughout operation phase.
Performance Indicator	Limited attraction of insects to light sources Limited foraging of bats around light sources Limited mortality at insects at light sources	
Monitoring	ECO must ensure no infrastructure is in No-Go areas (Figure 3). ECO must ensure motion-sensor lighting is used. ECO must ensure all lighting fixtures have hoods and/or are downward facing, where appropriate, to prevent sky-glow. ECO must ensure minimum lighting is used and lighting is spaced to prevent excessive use of lighting. ECO must ensure low-pressure sodium lighting is used.	

8 CONCLUSION

This EIA report assessed impacts to bats that could occur because of the construction, operation and decommission of the Sheepmoor WEF and grid connection. The assessment was based on 16 months of baseline data on bat activity recorded at the project. Based on these data, the key issue for the WEF will be managing collision impacts to Cape serotine and Egyptian free-tailed bat, and cumulative impacts.

The first mitigation measure proposed to manage risk is to adhere to the no-go buffers which aim to spatially avoid impacts by buffering key habitat features used by bats. This measure is likely to be effective for most bat species recorded at the project, but additional mitigation measures are needed to avoid impacts to free-tailed bats, which forage high in the air, and to reduce residual impacts.

Turbine design can be effective, and it is recommended to maintain a minimum blade sweep of at least 30 m. However, free-tailed bats will still collide with turbine blades above this height and as such, the rotor diameter must be limited as much as practicable to minimize the space where collisions might occur. Additionally, blade feathering must be implemented to limit the rotation of turbine blades below the turbine cut-in speed when electricity is not being generated.

Mitigation measures to minimize residual impacts after the application of the above measures include smart curtailment and acoustic deterrents. As such, the project should consider the cost and feasibility of these measures. The residual impacts must be monitored using post-construction fatality monitoring for a minimum of two years (Aronson et al. 2020). Smart curtailment and/or acoustic deterrents must be used if this monitoring indicates that species fatality thresholds have been exceeded (MacEwan et al. 2018) to maintain the impacts to bats within acceptable limits of change and prevent declines in the impacted bat populations.

The overall impact to bats was assessed as moderate after the application of the mitigation measures proposed to avoid and minimize impacts to bats. However, on a species level, the project presents differential risk and impacts to bats must be managed adaptively during the operational phase, particularly for those species (e.g. Egyptian free-tailed bat and Cape serotine) for which high risk is predicted during some periods.

This adaptive management will be guided by the Environmental Management Programme for bats which must include the development of a Biodiversity Management Plan (BMP) to manage impacts to bats during

the operation of the facility. The BMP for bats must be developed by a bat ecologist before the commencement of operation and must include the post-construction fatality monitoring plan design, fatality thresholds calculations and rationale (updated as required), and an adaptive management response plan that provides a timeous action pathway for mitigation, including roles and responsibilities, should fatality thresholds be exceeded. Provided these measures are adhered to, the project assessed can be approved.

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

In consultation with the applicant, Mulilo, we are proposing a provisional date of Wednesday, 7 August 2025, with the meeting to be held at a venue in Ermelo. Kindly confirm whether this date is suitable for you and whether you will be attending alone or accompanied by others.

As a registered I&AP, your comments form an important part of the formal public participation process and will be incorporated into the Final EIA Reports. We also acknowledge the concerns raised regarding the tagging of the Martial Eagles. Relevant documentation, including permits, will be made available where appropriate to support transparency and clarity during the engagement.

We look forward to your response.

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Good day Lucien,

Thank you for informing us of the below communications.

I understand his point of view, but our availability is slightly restricted, may we please request that we instead meet on Monday the 4th?

We require our LO Manager - @Johans Van Wyk, to attend the meeting. He has an existing relationship with Mr Meyer and will send him a whatsapp also requesting a meeting on the 4th.

Kind Regards,

Lloyd Barnes
Senior Associate: Developer.

Hi Lloyd,

Please see below correspondence from My Meyer regarding the upcoming meeting. He would like to shift this meeting to next week prior to 1st August. He is requesting several documents listed below before the meeting commences.

I have followed up with Albert regarding those figures in his report, I'll try and reach him telephonically to gain a faster response.

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

EXTERNAL MESSAGE

Good morning all,

Mr. Meyer informed me over the phone that he would like to have the meeting preferably *before* the 1st of Aug to allow his team to draft an appropriate response before PPP concludes.

Mr. Meyer indicated his availability as follow:

- Mon 28th Jul
- Tue 29th Jul
- Thu 30th Jul
- Mon 4th Aug

I am not available in the 1st Aug unfortunately – the above dates suites me well also.

Sincerely,

Johans van Wyk

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

If it was deliberate we request the detailed reasoning and motivation for such a drastic decision.

Thanks

Josua Meyer

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Hi Lloyd,

Are we then still aiming for the 4th of August for the meeting? That date would allow sufficient time for preparation and internal approvals on our side.

If you're considering a date before the 1st of August instead, could you please confirm which one you're leaning toward? I'd like to plan accordingly, including finalising the costing.

Thanks

EXTERNAL MESSAGE

Good morning all,

Mr. Meyer informed me over the phone that he would like to have the meeting preferably *before* the 1st of Aug to allow his team to draft an appropriate response before PPP concludes.

Mr. Meyer indicated his availability as follow:

- Mon 28th Jul
- Tue 29th Jul
- Thu 30th Jul
- Mon 4th Aug

I am not available in the 1st Aug unfortunately – the above dates suites me well also.

Sincerely,

Johans van Wyk

Good day Lucien,

Thank you for informing us of the below communications.

I understand his point of view, but our availability is slightly restricted, may we please request that we instead meet on Monday the 4th?

We require our LO Manager - @Johans Van Wyk, to attend the meeting. He has an existing relationship with Mr Meyer and will send him a whatsapp also requesting a meeting on the 4th.

Kind Regards,

Lloyd Barnes
Senior Associate: Developer.

Hi Lloyd,

Please see below correspondence from My Meyer regarding the upcoming meeting. He would like to shift this meeting to next week prior to 1st August. He is requesting several documents listed below before the meeting commences.

I have followed up with Albert regarding those figures in his report, I'll try and reach him telephonically to gain a faster response.

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Good morning, Cecilia,

Thank you for your request.

Kindly confirm whether we may submit a USB drive containing the full set of Draft Environmental Impact Assessment (EIA) Reports for the Sheepmoor and Emvelo Wind Energy Facilities, in lieu of printed hard copies. The USB will include all relevant documentation to assist your scientists in their review and commentary.

If possible, we would appreciate it if you could get back to us today, so that we can arrange for delivery as soon as possible.

EXTERNAL MESSAGE

Dear Lucien,
My apologies, there was a subtraction mistake on my invoice no. 215 (a previous invoice, no. 160, which had been paid, was not subtracted from the due amount). Invoice no. 215 was initially issued on 03 March 2025.

1. I have corrected this and reissued the invoice as No. 215 Rev 01, but kept the original issue date (attached);
2. My statement has also been corrected to reflect this (attached);
3. I have also included my spreadsheet that sets out my fees and the scope changes over time (this was previously submitted to you).

I trust all is in order. Let me know if you have any questions.
Kind regards
G

Good morning, Cecilia,

Thank you for your request.

Kindly confirm whether we may submit a USB drive containing the full set of Draft Environmental Impact Assessment (EIA) Reports for the Sheepmoor and Emvelo Wind Energy Facilities, in lieu of printed hard copies. The USB will include all relevant documentation to assist your scientists in their review and commentary.

If possible, we would appreciate it if you could get back to us today, so that we can arrange for delivery as soon as possible.

Kind Regards

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Hi Lloyd,

Are we then still aiming for the 4th of August for the meeting? That date would allow sufficient time for preparation and internal approvals on our side.

If you're considering a date before the 1st of August instead, could you please confirm which one you're leaning toward? I'd like to plan accordingly, including finalising the costing.

Thanks

EXTERNAL MESSAGE

Good morning all,

Mr. Meyer informed me over the phone that he would like to have the meeting preferably *before* the 1st of Aug to allow his team to draft an appropriate response before PPP concludes.

Mr. Meyer indicated his availability as follow:

- Mon 28th Jul
- Tue 29th Jul
- Thu 30th Jul
- Mon 4th Aug

I am not available in the 1st Aug unfortunately – the above dates suites me well also.

Sincerely,

Johans van Wyk

Good day Lucien,

Thank you for informing us of the below communications.

I understand his point of view, but our availability is slightly restricted, may we please request that we instead meet on Monday the 4th?

We require our LO Manager - @Johans Van Wyk, to attend the meeting. He has an existing relationship with Mr Meyer and will send him a whatsapp also requesting a meeting on the 4th.

Kind Regards,

Lloyd Barnes

Hi Lloyd,

Please see below correspondence from My Meyer regarding the upcoming meeting. He would like to shift this meeting to next week prior to 1st August. He is requesting several documents listed below before the meeting commences.

I have followed up with Albert regarding those figures in his report, I'll try and reach him telephonically to gain a faster response.

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

> > Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Kind regards,

EXTERNAL MESSAGE

Hi Lucien,

Thanks for your email and follow-up.

Our response to the comment raised is as follows:

In both the proposed Emvelo and Sheepmoor WEF avifaunal reports, Figure 33 refers to No-Go Zones around Yellow-breasted Pipit Habitat. However, we assume the respondent is referring to Figure 31, which addresses aquatic buffers.

Initially, as a precautionary approach, the avifaunal buffers related to aquatic features included a uniform 200m buffer area around all wetland and drainage line features. In the final avifaunal report, however, the following sensitive areas were considered:
- All wetland areas and drainage lines as identified by the aquatic specialist.
- Minor drainage lines that only facilitate runoff were not assigned an additional avifaunal buffer beyond what was already proposed by the aquatic specialist.

The rationale for this adjustment is as follows:

- Minor drainage line areas that only facilitate runoff would not hold permanent water and, therefore, would not provide suitable habitat for water and wetland-associated species.
- Extensive wetland habitat models for wetland-associated species (including spp 23) were developed for the project areas, focusing on providing comprehensive avoidance mitigation around the most expansive and sensitive wetland habitats.
- Waterbird and wetland-associated species are expected to use these extensive wetland areas in higher densities, and the avoidance mitigation would thus offer a high degree of protection.
- Although it is acknowledged that waterbirds may also move outside these areas, it is essential to note that extensive additional mitigation measures will be in place at the facilities, such as Auto SDoD and Radar SDoD.
- Waterbird species of conservation concern will be added as SDoD trigger species as part of the Biodiversity Management Plan (BMP) to be developed and implemented prior to operation.
- The BMP will also allow for the modification and enhancement of mitigation measures if any thresholds are exceeded

Let us know if you have further questions.

Best regards / Vriendelike groete,

Albert

Hi Albert,

Trusting you are well! As you know we are out for the second round of DEIAr PPP. I have an I&AP comment below regarding the figures on the avifaunal report.

I've looked at the Figure 33 in the latest report and it is labelled "No-Go Zones around Yellow-breasted Pipit Habitat"

I require your input to the comment below, are you able to provide clarity on the below? To my understanding you would not have aquatic buffer zones present for a Yellow-breasted Pipit.

I'm available to take a call should a brief discussion be needed.

Thank you

Goodday Sir

The avifaunal specialist removed in both reports, Sheepmoor WEF and Emvelo WEF, the High Sensitivity - Turbine Exclusion Zone in Figures 33 for the aquatic buffer zones from an avifaunal perspective.

It must be an unintentional mistake and request reinstatement of it.

If it was deliberate we request the detailed reasoning and motivation for such a drastic decision.

Thanks

Josua Meyer

Hi Serah, I hope this message finds you well.

We acknowledge receipt of your correspondence regarding the draft Environmental Impact Assessment (EIA) Report for the Sheepmoor and Emvelo Wind Energy Facilities in Mpumalanga Province.

We would like to kindly request clarity on the specific application you are referring to in your response. It is our understanding that as part of the EIA process, we submitted the relevant reports to your department for review and comment in your capacity as a commenting authority and Interested and Affected Party (I&AP).

To ensure we comply with all procedural requirements, we would appreciate your guidance on the nature and purpose of the formal application required under the Subdivision of Agricultural Land Act, 70 of 1970 at this stage of the process.

Your assistance and clarification in this regard will be highly appreciated.

Kind Regards

EXTERNAL MESSAGE

Hi Lucien,

Thanks for your email and follow-up.

Our response to the comment raised is as follows:

In both the proposed Emvelo and Sheepmoor WEF avifaunal reports, Figure 33 refers to No-Go Zones around Yellow-breasted Pipit Habitat. However, we assume the respondent is referring to Figure 31, which addresses aquatic buffers.

@Lucien Barbeau would you please confirm that this is the numbering used in the report you circulated as we were never provided with a copy thereof despite several requests.

Initially, as a precautionary approach, the avifaunal buffers related to aquatic features included a uniform 200m buffer area around all wetland and drainage line features. In the final avifaunal report, however, the following sensitive areas were considered:
- All wetland areas and drainage lines as identified by the aquatic specialist.
- Minor drainage lines that only facilitate runoff were not assigned an additional avifaunal buffer beyond what was already proposed by the aquatic specialist.

The rationale for this adjustment is as follows:

- Minor drainage line areas that only facilitate runoff would not hold permanent water and, therefore, would not provide suitable habitat for water and wetland-associated species.
- Extensive wetland habitat models for wetland-associated species (including Spp 23) were developed for the project areas, focusing on providing comprehensive avoidance mitigation around the most expansive and sensitive wetland habitats.
- Waterbird and wetland-associated species are expected to use these extensive wetland areas in higher densities, and the avoidance mitigation would thus offer a high degree of protection.
- Although it is acknowledged that waterbirds may also move outside these areas, it is essential to note that extensive additional mitigation measures will be in place at the facilities, such as Auto SDoD and Radar SDoD.
- Waterbird species of conservation concern will be added as SDoD trigger species as part of the Biodiversity Management Plan (BMP) to be developed and implemented prior to operation.
- The BMP will also allow for the modification and enhancement of mitigation measures if any thresholds are exceeded

Good day

I hope all is well.

Can you kindly provide the department with a hard copy application as the link provided contain documents that are more than 800 pages and such will be impossible to print.

I hope the above is in order.

Regards
Serah

Hi Serah, I hope this message finds you well.

We acknowledge receipt of your correspondence regarding the draft Environmental Impact Assessment (EIA) Report for the Sheepmoor and Emvelo Wind Energy Facilities in Mpumalanga Province.

We would like to kindly request clarity on the specific application you are referring to in your response. It is our understanding that as part of the EIA process, we submitted the relevant reports to your department for review and comment in your capacity as a commenting authority and Interested and Affected Party (I&AP).

To ensure we comply with all procedural requirements, we would appreciate your guidance on the nature and purpose of the formal application required under the Subdivision of Agricultural Land Act, 70 of 1970 at this stage of the process.

Your assistance and clarification in this regard will be highly appreciated.

Kind Regards

Good day

The Department has noted the letter regarding the draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province. Therefore, the department of Agriculture would request a formal application in terms of the Subdivision of Agricultural Land Act, 70 of 1970 in order to provide formal comments.

Your assistance will highly be appreciated in this regard.

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Good morning, Serah,

Thank you for your request.

Kindly confirm whether we may submit a USB drive containing the full set of Draft Environmental Impact Assessment (EIA) Reports for the Sheepmoor and Emvelo Wind Energy Facilities, in lieu of printed hard copies. The USB will include all relevant documentation to assist your scientists in their review and commentary.

If possible, we would appreciate it if you could get back to us today, so that we can arrange for delivery as soon as possible. Kindly include address and contact (Cell no.) that should be used for delivery notification.

Dear Mr Meyer,

I hope this message finds you well.

I'm writing to kindly follow up on our proposed meeting scheduled for Monday, 4 August at 13:00 at your farm. We would appreciate it if you could please confirm whether you are still available to meet on that date.

Should you require any additional information or documentation ahead of the meeting, beyond what you have already requested, please don't hesitate to let me know, I'd be happy to assist.

Looking forward to your confirmation.

Kind regards,

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

In consultation with the applicant, Mulilo, we are proposing a provisional date of Wednesday, 7 August 2025, with the meeting to be held at a venue in Ermelo. Kindly confirm whether this date is suitable for you and whether you will be attending alone or accompanied by others.

As a registered I&AP, your comments form an important part of the formal public participation process and will be incorporated into the Final EIA Reports. We also acknowledge the concerns raised regarding the tagging of the Martial Eagles. Relevant documentation, including permits, will be made available where appropriate to support transparency and clarity during the engagement.

We look forward to your response.

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

If it was deliberate we request the detailed reasoning and motivation for such a drastic decision.

Thanks

Josua Meyer

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Kind regards,

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Kind regards,

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

On Wed, Jul 16, 2025 at 4:41 PM Josua Meyer <meyerjosua55@gmail.com> wrote:

Goodday Sir

The avifaunal specialist removed in both reports, Sheepmoor WEF and Emvelo WEF, the High Sensitivity - Turbine Exclusion Zone in Figures 33 for the aquatic buffer zones from an avifaunal perspective.

It must be an unintentional mistake and request reinstatement of it.

If it was deliberate we request the detailed reasoning and motivation for such a drastic decision.

Thanks

Josua Meyer

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Kind regards,

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Goodday Sir

The avifaunal specialist removed in both reports, Sheepmoor WEF and Emvelo WEF, the High Sensitivity - Turbine Exclusion Zone in Figures 33 for the aquatic buffer zones from an avifaunal perspective.

It must be an unintentional mistake and request reinstatement of it.

If it was deliberate we request the detailed reasoning and motivation for such a drastic decision.

Thanks

Josua Meyer

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Dear Lloyd,

We have received a communication from the Department of Agriculture, Land Reform and Rural Development (DALRRD) regarding the circulation of the Draft EIA Report for public review. The department has stated that a formal application in terms of the Subdivision of Agricultural Land Act, 70 of 1970 (SALA) is necessary to provide comments on the application. Specifically, if the report exceeds 100 pages, hard copies must be delivered to their offices, along with an application fee of R1000.00.

Could you please confirm whether Mulilo has already submitted an application under SALA?

Please be aware that, as per our contractual agreement, the submission and processing of SALA or related applications are outside the current scope of our engagement. We would appreciate your guidance on how you wish to proceed.

Do not hesitate to reach out if you need any clarification.

EXTERNAL MESSAGE

Dear Mpho,

I hope you are well.

Following our telephone conversation, the below comments will not affect or impact the current final impact report.

Please note the below comments should be considered before project construction phase upon receipt of an Environmental Authorisation.
Due to the nature of this project, a formal obstacle assessment will be required to determine whether the proposal could impact flight safety.

Kindly lodge an application as published on the SACAA website: www.caa.co.za/industryinformation/obstacles/ .The list and contact details of the approved obstacles assessment services providers can be obtained from the CAA website: www.caa.co.za .

Subject: Reminder: Draft EIA Reports Available for Comment – Sheepmoor and Emvelo Wind Energy Facilities

"This message was sent from outside of SACAA. Please use caution when opening links and/ or attachments"

Dear Interested and Affected Party,

This is a reminder regarding the submission of the Draft Environmental Impact Assessment (EIA) Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities in the Mpumalanga Province.

The Public Participation Process (PPP) is being conducted in accordance with Section 24(5) and Chapter 6 (Regulations 41–44) of GN R. 326 of the NEMA EIA Regulations, 2014 (as amended), as well as the Western Cape Department of Environmental Affairs and Development Planning (DEA&DP) Guideline on Public Participation (2011). The Draft EIA Reports have been made available for a 30-day comment period, which will close on 10 April 2025 **(Tomorrow).**

Following comprehensive input from Interested and Affected Parties (I&APs) in the scoping phase, the applicant has conducted several additional studies to address all identified sensitivities. In response to these sensitivities, the applicant has optimized the arrangement of the wind turbines and related infrastructure. This significant reduction in the number of turbines has prompted the applicant to consolidate the projects from three to two. The applicant has merged the previous Rochdale application site with the Emvelo application and will be withdrawing the separate Rochdale application. We anticipate no issues arising from this change, as all feedback, scoping findings, sensitivities, and specialist contributions related to Rochdale will be integrated into the Emvelo application. The updated layouts also feature extensive conservation zones, as the applicant recognizes a unique opportunity to implement strategies that enhance the biodiversity value of the project area.

Should you wish to have your comments included in the submission of the Final EIA Report, please ensure they are submitted on or before 10 April 2025. Further information on how to participate in this process is available in the documentation provided. Kindly indicate whether your comment refers to the Sheepmoor or Emvelo application.

Thank you for your continued participation and interest in this project.

Kind Regards

EXTERNAL MESSAGE

Good day Stephen,

Thank you for raising this.

We will not be applying for SALA as we intend on registering leases over each project property, and not lease areas for each WTG. Therefor SALA is not triggered.

Please may you communicate this with the I&AP. DALRRD are welcome to comment on the EIA process.

Kind Regards,

Lloyd Barnes

Subject: RE: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Dear Nhlamulo,

Thank you for your correspondence regarding the below-mentioned Amsterdam WEFs.

Kindly be advised that the applicant has confirmed that a SALA application will not be submitted, as the intention is to register leases over the entire project properties, rather than leasing portions of land for individual wind turbine generators. As such, the requirements of the Subdivision of Agricultural Land Act, 70 of 1970 (SALA) are not triggered in this instance.

Nonetheless, the applicant welcomes any comments that the Department may wish to provide on the Draft Environmental Impact Assessment Report (https://www.erm.com/public-information-sites/proposed-amsterdam-wind-energy-facility-and-auxiliary-infrastructure-cluster-mpumalanga/) as part of the environmental authorisation process.

Please do not hesitate to contact us should you require any further information or clarification.

Hi Serah, I hope this message finds you well.

We acknowledge receipt of your correspondence regarding the draft Environmental Impact Assessment (EIA) Report for the Sheepmoor and Emvelo Wind Energy Facilities in Mpumalanga Province.

We would like to kindly request clarity on the specific application you are referring to in your response. It is our understanding that as part of the EIA process, we submitted the relevant reports to your department for review and comment in your capacity as a commenting authority and Interested and Affected Party (I&AP).

To ensure we comply with all procedural requirements, we would appreciate your guidance on the nature and purpose of the formal application required under the Subdivision of Agricultural Land Act, 70 of 1970 at this stage of the process.

Your assistance and clarification in this regard will be highly appreciated.

Kind Regards

EXTERNAL MESSAGE

Good day

The Department has noted the letter regarding the draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province. Therefore, the department of Agriculture would request a formal application in terms of the Subdivision of Agricultural Land Act, 70 of 1970 in order to provide formal comments.

Your assistance will highly be appreciated in this regard.

Regards
Serah

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as

amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

TO WHOM IT MAY CONCERN

Eskom requirements for work in or near Eskom servitudes.

1. Eskom's rights and services must be acknowledged and respected at all times.

2. Eskom shall at all times retain unobstructed access to and egress from its servitudes.

3. Eskom's consent does not relieve the developer from obtaining the necessary statutory, land owner or municipal approvals.

4. Any cost incurred by Eskom as a result of non-compliance to any relevant environmental legislation will be charged to the developer.

5. If Eskom has to incur any expenditure in order to comply with statutory clearances or other regulations as a result of the developer's activities or because of the presence of his equipment or installation within the servitude restriction area, the developer shall pay such costs to Eskom on demand.

6. The use of explosives of any type within 500 metres of Eskom's services shall only occur with Eskom's previous written permission. If such permission is granted the developer must give at least fourteen working days prior notice of the commencement of blasting. This allows time for arrangements to be made for supervision and/or precautionary instructions to be issued in terms of the blasting process. It is advisable to make application separately in this regard.

7. Changes in ground level may not infringe statutory ground to conductor clearances or statutory visibility clearances. After any changes in ground level, the surface shall be rehabilitated and stabilised so as to prevent erosion. The measures taken shall be to Eskom's satisfaction.

8. Eskom shall not be liable for the death of or injury to any person or for the loss of or damage to any property whether as a result of the encroachment or of the use of the servitude area by the developer, his/her agent, contractors, employees, successors in title, and assignees. The developer indemnifies Eskom against loss, claims or damages including claims pertaining to consequential damages by third parties and whether as a result of damage to or interruption of or interference with Eskom's services or apparatus or otherwise. Eskom will not be held responsible for damage to the developer's equipment.

9. No mechanical equipment, including mechanical excavators or high lifting machinery, shall be used in the vicinity of Eskom's apparatus and/or services, without prior written permission having been granted by Eskom. If such permission is granted the developer must give at least seven working days' notice prior to the commencement of work. This allows time for arrangements to be made for supervision and/or precautionary instructions to be issued by the relevant Eskom Manager

Note: Where and electrical outage is required, at least fourteen work days are required to arrange it.

10. Eskom's rights and duties in the servitude shall be accepted as having prior right at all times and shall not be obstructed or interfered with.

11. Under no circumstances shall rubble, earth or other material be dumped within the servitude restriction area. The developer shall maintain the area concerned to Eskom's satisfaction. The developer shall be liable to Eskom for the cost of any remedial action which has to be carried out by Eskom.

12. The clearances between Eskom's live electrical equipment and the proposed construction work shall be observed as stipulated by *Regulation 15* of the *Electrical Machinery Regulations of the Occupational Health and Safety Act, 1993 (Act 85 of 1993).*

13. Equipment shall be regarded electrically live and therefore dangerous at all times.

14. In spite of the restrictions stipulated by Regulation 15 of the Electrical Machinery Regulations of the Occupational Health and Safety Act, 1993 (Act 85 of 1993), as an additional safety precaution, Eskom will not approve the erection of houses, or structures occupied or frequented by human beings, under the power lines or within the servitude restriction area.

15. Eskom may stipulate any additional requirements to highlight any possible exposure to Customers or Public to coming into contact or be exposed to any dangers of Eskom plant.

16. It is required of the developer to familiarise himself with all safety hazards related to Electrical plant.

17. Any third party servitudes encroaching on Eskom servitudes shall be registered against Eskom's title deed at the developer's own cost. If such a servitude is brought into being, its existence should be endorsed on the Eskom servitude deed concerned, while the third party's servitude deed must also include the rights of the affected Eskom servitude.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

We acknowledge your request for a meeting to discuss the concerns raised. In consultation with the applicant, Mulilo, we are proposing a provisional date of Wednesday, 7 August 2025, with the meeting to be held at a venue in Ermelo. Kindly confirm whether this date is suitable for you and whether you will be attending alone or accompanied by others.

As a registered I&AP, your comments form an important part of the formal public participation process and will be incorporated into the Final EIA Reports. We also acknowledge the concerns raised regarding the tagging of the Martial Eagles. Relevant documentation, including permits, will be made available where appropriate to support transparency and clarity during the engagement.

We look forward to your response.

Kind Regards,

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Please note that the public comment period for the Draft Environmental Impact Assessment (EIA) Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities has been extended by one day, due to the public holiday on 9 August 2025.

The revised comment period now ends on 15 August 2025.

All other details remain unchanged. We encourage you to submit your comments by the new deadline should you wish to have your input considered in the Final EIA Report.

Thank you for your continued participation.

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development

Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

> > Dear Mr. Meyer,

Good day, and thank you for your recent correspondence regarding the Draft EIA Reports.

We acknowledge your request for a meeting to discuss the concerns raised. In consultation with the applicant, Mulilo, we are proposing a provisional date of Wednesday, 7 August 2025, with the meeting to be held at a venue in Ermelo. Kindly confirm whether this date is suitable for you and whether you will be attending alone or accompanied by others.

As a registered I&AP, your comments form an important part of the formal public participation process and will be incorporated into the Final EIA Reports. We also acknowledge the concerns raised regarding the tagging of the Martial Eagles. Relevant documentation, including permits, will be made available where appropriate to support transparency and clarity during the engagement.

We look forward to your response.

Kind Regards,

ERM

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Goodday Sir

The avifaunal specialist removed in both reports, Sheepmoor WEF and Emvelo WEF, the High Sensitivity - Turbine Exclusion Zone in Figures 33 for the aquatic buffer zones from an avifaunal perspective.

It must be an unintentional mistake and request reinstatement of it.

If it was deliberate we request the detailed reasoning and motivation for such a drastic decision.

Thanks

Josua Meyer

> Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

EXTERNAL MESSAGE

Dear Lucian,

Your request is received but kindly note the following:

Due Dates - Due to committed site visits taking place on 11 and 12 August 2025, unfortunately it is not possible to meet the due date of 12 August 2025. The revised issue date must consider both the updating and internal reviews which would be at least one (1) week.

Variation Order - Our team will review the final layouts and determine whether the changes will require and Addendum Letter or Full Revisions to be issued. The time and effort for updating the reports (full revisions) will require a variation order which will be confirmed and communicated to you for approval.

Trust you find the above in order.

Kind regards

Dear Sir/Madam

We have briefly perused the draft EIA report and have been unable to find any reference to the comment submitted by us on the instructions of our client, a copy of which is attached to this email.

Kindly refer us to the relevant pages of the draft report which deal with our client's comments?

We further note from the draft report that a formal application has been lodged with Air Traffic and Navigation Services (ATNS) for a formal obstacles assessment to be conducted. Kindly furnish us with a copy of this application and all communications to and from ATNS relating thereto.

We look forward to hearing from you as a matter of urgency.

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. Dear Sirs

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

1 We address this correspondence to you on the instructions of our clients, the Trustees for the time being of the Peter Celliers Trust ("**the Trust**").

2 The Trust is the owner of Portions 8, 19 and 28 of the Roodewal Farm (Farm number 270), Registration Division IT, Mpumalanga. It is an interested and affected party with regard to the proposed development of the Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province.

3 The Trust conducts an aerodrome and a helipad from Portion 28 of its farm. The aerodrome has been used for aircraft of the Learjet and KingAir categories and has, at all times material hereto, remained in regular use. The landing strip of the aerodrome is used in both directions.

4 The operation and safety requirements of aerodromes and helipads are governed by the provisions of the Civil Aviation Act, 13 of 2009, the Civil Aviation Regulations, 2011 (as amended) ("**the Regulations**") and Annex 14 to the Convention on International Civil Aviation, 7th Edition, July 2016.

5 The safety requirements for aerodromes and heliports are contained in Part 139 of the Regulations and Regulation 139.01.30 deals with obstacle limitation and marking outside aerodromes and heliports. Regulation 139.01.30(1) imposes an obligation on the holder of an aerodrome licence to monitor the surroundings of the aerodrome to assess permanent or temporary obstacle limitation and penetration surfaces, to establish if any obstacle has an impact on the safety of aircraft operations at such aerodrome. Sub-regulation (7) goes

on to provide that the holder of an aerodrome licence shall not allow to be erected, without the prior approval of the Director, an object higher than 45 meters above the mean level of a landing area or within 8 kilometres measured from the nearest point on a boundary of an aerodrome. Regulation 139.01.30 further incorporates the provisions of Document SA-CATS 139.

6 Document SA-CATS 139.01.30 elaborates upon the requirements for obstacle limitations and markings outside aerodromes or heliports. Paragraph 1.14 deals extensively with the requirements pertaining to wind turbine generators (wind farms) and paragraph 1.14(2), dealing with wind farm placement, states as follows:

> "*Due to the potential of wind turbine generators to interfere on* (sic) *radio navigation equipment, no Windfarm should be built closer than 35 km from an aerodrome. In addition, much care should be taken to consider visual flight rules routes, proximity of known recreational flight activity such as hang-gliders, en route navigational facilities etc.*" (our underlining)

7 In addition to the aerodrome, there is a registered nature conservancy named Nu-Scotland on the Trust's farm. The conservancy regularly hosts guests and bi-annually hosts cricket groups of between 80 to 100 people. The visual impact assessments of the proposed wind farms will need to take the use of the Trust's farm as a nature conservancy into account. The conservancy is home to a wide range of antelope, zebra and birds, including Secretary Birds, which have been classified as endangered, largely due to habitat degradation. Appropriate mitigation measures will need to be put in place to address the threats that the wind farms will pose to the fauna on the Trust's farm and surrounds.

8 The Trust is accordingly opposed to the erection of any wind turbines closer than 35 kilometres from the boundary of the Trust's aerodrome.

Yours faithfully

EXTERNAL MESSAGE

Dear Lucien,

Thank you for sharing these updated layouts. We have perused them and have a few queries:

1. Why have the respective WEF boundaries changed from what was submitted in our specialist reports released for public comment on 15 July?
2. As a result of these changes, according to the KMZs, it appears there have been additions/removals re the affected properties included in each WEF site – can you please provide us with an updated list of the affected properties per project?
3. Also, the following turbines appear to be located on both Emvelo and Sheepmoor WEFs as the site boundaries include the same properties: WTGs 18, 21, 26, 27, 28, 29, 30. Can you please clarify why this is the case?

Thank you, we look forward to your soonest feedback.

Once we have your feedback and clarification regarding this, we can commence with updating the maps in the reports.

Best regards / Vriendelike groete,

Albert

p) a summary and copies of any comments received during any consultation process and where applicable all responses thereto; and	NA
q) any other information requested by the competent authority.	NA
2) Where a government notice *gazetted* by the Minister provides for any protocol or minimum information requirement to be applied to a specialist report, the requirements as indicated in such notice will apply.	Appendix 5: Site Sensitivity Verification Report

1 INTRODUCTION

Emvelo Wind Energy Facility (Pty) Ltd are proposing the development of a commercial wind energy project located near Ermelo, within the Msukaligwa Local Municipality and the Gert Sibande District Municipality, in the Mpumalanga Province. The project forms part of a development cluster that is expected to comprise two separate Wind Energy Facilities (WEFs).

This EIA report covers the Emvelo WEF which is proposed to comprise up to 25 turbines with a maximum output capacity of up to 260 MW. The WEF will have an anticipated lifespan of 25 – 30 years. In addition to the wind energy infrastructure, it is proposed that an on-site substation with a capacity up 132 kV and an up to 132 kV Overhead Powerline (OHPL) of approximately 30 km (300 m corridor) in distance, traversing eighteen (18) land parcels, be constructed to connect the proposed WEF to the proposed new Camden B substation. The proposed technical details of Emvelo WEF are presented below:

Developer / Applicant	Emvelo WEF
DFFE Reference	To be confirmed
WEF Generation Capacity	Up to 260 MW
Site Access	Locality to be confirmed. Total width up to 15 m (12 m after rehabilitation) consisting of up to 3m width for underground 33 kV reticulation.
Number of Turbines	Up to 25
Hub Height from ground level	Up to 150 m
Blade Length	Up to 110 m
Rotor Diameter	Up to 220 m
Length of internal roads	Unknown at this point.
Width of internal roads	Up to 12 m to be rehabilitated to up to 9 m.
On-site substation capacity	Up to 132 kV
Proximity to grid connection	Approximately 25 km
Grid Connection Capacity	Up to 132 kV
Temporary turbine construction laydown and storage areas.	Crane platforms and hardstand laydown area up to 40 ha (Up to 1 ha per turbine)
Permanent footprint area dimensions, including roads, turbine hardstand areas, O&M buildings and battery pad.	O&M: Up to 1 ha Hardstand areas: Up to 1 ha Total area of final footprint (including roads): up to 180 ha
Operations and maintenance buildings (O&M building) with parking area	Up to 1 ha
Height of fencing	2.8 m
Type of fencing	Where site offices are required, temporary screen fencing used to screen offices from the wider landscape.

1.1 Scope and Objectives

This EIA report presents a Bat (Chiroptera) Impact Assessment for the Emvelo WEF and associated grid connection. Collisions with wind turbine blades are a leading cause of bat mortality globally (Cryan, 2011; O'Shea et al., 2016). Given the nature, scale, and uncertainty of these impacts to bats, specialist studies are required to assess the risks of renewable energy infrastructure on bats (Rodrigues 2015, MacEwan et al. 2020b, SANBI 2020, Bennun et al. 2021).

The objectives of this assessment are to present the baseline ecological condition of the project site for bats, and to use these characterisations to predict and assess the potential impact of the project on bat species and their habitats as well as to provide actions to mitigate impacts if required.

2 ASSUMPTIONS AND LIMITATIONS

The core techniques used to assess bat activity in this study are acoustic monitoring and roost surveys, both of which have several limitations which will influence the findings and recommendations of this study.

Acoustic monitoring allows for rapid, passive collection of a large volume of bat activity data which can help identify the bat species present within a particular location and their associated spatio-temporal relative activity patterns. In the context of wind farms, acoustic monitoring is therefore a useful technique however, there are several constraints that must be acknowledged. These are discussed in detail by Voigt et al. (2021), Adams et al. (2012), and Kunz et al. (2007a) and fundamentally, include that acoustic monitoring cannot provide an indication of bat abundance or population size at a site. In addition, population demographics such as age and sex of bats cannot generally be determined from echolocation calls.

Due to the large volume of data collected by bat detectors it is impractical and prohibitively time-consuming to inspect each file for echolocation calls and to identify the associated bat species. Specialised statistical software uses bat call reference libraries to automate the identification process but developing such libraries is challenging given the variation individual species display in their echolocation call structure and overlap between species. This study used the Wildlife Acoustics library "Bats of South Africa Version 5.4.2", but this excludes reference calls for most South African species thus these may have been overlooked. However, given the duration of the monitoring and spatial coverage of the detectors, the acoustic data provides a reasonable inventory of the species present, and a good indication of the relative magnitude of bat activity. Lastly, bat activity is notably variable in response to a number of factors such as land use change, climactic variability, variations in prey abundance and meteorological conditions which can vary over different time scales. Since this study is limited to 12 months, the baseline conditions presented here may not be representative of activity over longer time frames meaning risk may be misinterpreted.

The major limitation with roost surveys is finding roosting bats. Bats use a diversity of roosting sites including trees, buildings, crevices, and underground sites (caves and mines). The presence of these features at a site can help to target roost searches but evidence of bats may not always be apparent even if bats are present. Importantly, the absence of bat evidence in these situations does not equate to evidence of bat absence (Collins 2006). Thus, this study uses a precautionary approach and will apply buffers to roosts (largely buildings and rocky crevices) even if bats were not located given their potential role in supporting roosting bats.

It is difficult to assess the risk to bats during operation of the proposed facility based on acoustic data collected during pre-construction surveys. For example, Hein et al. (2013) showed that pre-construction bat activity was not a significant indicator of collision risk. Lintott et al. (2016) argued that environmental impact assessments do not predict the risks to bats accurately. This may partly be because it is hypothesized that bats may be attracted to wind turbines (Cryan and Barclay 2009, Guest et al. 2022) which some evidence suggests may be the case (Horn et al. 2008, Richardson et al. 2021). While this report makes predications about the potential risk to bats posed by the project, these carry a degree of uncertainty and

must be verified by using post-construction surveys to ensure that the predictions are accurate and bat behaviour has not altered from pre-construction levels (Lintott et al. 2016).

Risk to bats was determined based on median bat activity per night derived from the bat activity dataset collected with acoustic monitoring. Median values were compared to those in Table 5 in MacEwan et al. (2020b) which provides height-specific fatality risk categories (high, medium, low) based on bat activity sampled in different South African terrestrial ecoregions. The Project Area of Influence (PAOI) is situated in the Highveld Grasslands ecoregion (Dinerstein et al. 2019) however reference values are not available for this ecoregion in MacEwan et al. (2020b). Instead, median values were compared to reference values for the Drakensberg Grasslands, Woodlands and Forest ecoregion. While bat activity levels differ between these two ecoregions this difference is small (MacEwan et al. 2020a). The lack of a direct reference for the Highveld Grasslands ecoregion is therefore not a major limitation and the comparison is suitable to provide an evaluation of risk.

3 LEGAL REQUIREMENTS AND GUIDELINES

The EIA processes for this project is being undertaken in terms of Government Notice (GN) No. R. 983 of 4 December 2014 (as amended to GNR 327), promulgated under the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA) EIA Regulations, 2014 (as amended). In addition, there are various international, regional, and local legislation, policies, regulations, guidelines, conventions, and treaties in place for the protection of biodiversity, under which bats would also be protected or considered. These create a policy environment and impact management framework aiming to prevent excessive impacts to biodiversity and which was used to assess risk of this specific project. Specific policies include the following:

- Convention on Biological Diversity Post-2020 Global Biodiversity Framework
- United Nations Sustainable Development Goals
- Convention on the Conservation of Migratory Species of Wild Animals (1979)
- Convention on Biological Diversity (1993)
- Constitution of the Republic of South Africa, 1996 (Act No. 108 of 1996)
- National Environmental Management Act, 1998 (NEMA, Act No. 107 of 1998)
- National Environmental Management: Biodiversity Act, 2004 (Act No. 10 of 2004)
- Northern Cape Nature Conservation Act (Act 9 of 2009)
- The Equator Principles (2013)
- International Finance Corporation Performance Standards (PS6)
- The Red List of Mammals of South Africa, Swaziland, and Lesotho (2016)
- South Africa National Biodiversity Strategy and Action Plan (2005)
- Guidelines for the implementation of the Terrestrial Flora (3c) & Terrestrial Fauna (3d) Species Protocols for environmental impact assessments in South Africa
- Mitigating biodiversity impacts associated with solar and wind energy development. IUCN Guidelines for project developers (2021)
- South African Good Practise Guidelines for Surveying Bats in Wind Energy Facility Developments – Pre-Construction (2020)
- South African Good Practise Guidelines for Operational Monitoring for Bats at Wind Energy Facilities (2020)
- South African Bat Fatality Threshold Guidelines (2018)
- Mitigation Guidance for Bats at Operational Wind Energy Facilities in South Africa (2018)

4 SURVEY METHODOLOGY

The Project Area of Influence (PAOI) was defined as the Area of Interest (AoI) of the development cluster plus a 10 km buffer given that bats are flying mammals (Scottish Natural Heritage 2019). This area was studied at a desktop level to determine which bat species (i.e., impact receptors) are likely to occur within the PAOI, to

provide information on their natural history and conservation status, and to contextualise the project site within the larger social-ecological environment with respect to bats.

Bats were also studied through 12 months of acoustic monitoring in the AoI which began on 26 April 2022 and ended on 4 July 2023. After this, monitoring continued at one met mast location until 11 November 2023. Bat activity was sampled at 11 locations (Figure 1, Table 1) within the AoI with Wildlife Acoustics, Inc. SM4 bat detectors. At nine locations (AM4 – AM12), SMM-U2 microphones were positioned at the top of a 10 m aluminium mast. At the remaining two locations (AM1 and AM3), microphones were positioned on meteorological towers at 10 m, 50 m, and 90 mrespectively. Equipment at AM12 was stolen and therefore data from this location were not available to be assessed in this report.

The bat detectors were programmed to record activity nightly, from 30 minutes before sunset to 30 minutes after sunrise, and this report summarises 518 nights of bat activity data. This monitoring period therefore spans of all four seasons providing a representative account of temporal bat activity patterns across a year. Acoustic data retrieved from each bat detector were processed using Kaleidoscope® Pro (Version 5.4.2, Wildlife Acoustics, Inc.). Bats were automatically identified using the embedded "Bats of South Africa Version 5.4.0" reference library and verified by inspecting echolocation files. The number of acoustic files recorded was used as a measure to quantify bat activity, whereby each file was considered one bat pass of themicrophone.

Roost surveys were undertaken which entailed discussions with landowners to locate any known roosts or potential roosts with evidence of bats. In addition, buildings at farmsteads within the PAOI, as well as accessible rocky outcrops/crevices, were systematically surveyed during field visits in November 2022 (spring), and January 2023 (summer). The surveys aimed to directly observe roosting bats, locate evidence of roosting bats (e.g., culled insect remains, fur-oil-stained exit and entry points, guano/droppings), and assess the likelihood for each potential roost to support bats.

Table 1: Summary of the Bat Acoustic Monitoring Sampling Locations and Effort

Bat Detector	Coordinates	# Sample Nights	Altitude (m)	Habitat Features
AM1 (Met mast)	-26.612298°S 30.317572°E	10m: 518 50 m: 226 90 m: 478	1,778	In Wakkerstroom Montane Grassland, 400 m west of small escarpment, 560 m north of farm dam, 440 m west of woodland patch, 560 m northeast of wetland
AM3 (Met Mast)	-26.587572°S 30.284137°E	10 m: 340 50 m: 435 90 m: 326	1,748	In Wakkerstroom Montane Grassland, 420 m west of farmstead, 420 m east of stream and seep wetland

5 SPECIALIST FINDINGS

5.1 Ecological Baseline

The Project Area of Influence (PAOI) is situated in the Grassland Biome and comprises predominantly Eastern Highveld Grassland vegetation (Figure 1). The landscape associated with this vegetation consists of slight to moderately undulating plains with small scattered rocky outcrops. The vegetation is short, dense grassland (Mucina and Rutherford 2006). Wakkerstroom Montane Grassland occurs in the middle of the PAOI, on low mountains and undulating plains. Here the vegetation comprises short montane grassland on plateaus and flat areas. On steep, east facing slopes and in drainage areas, short forest and thicket occurs. Both vegetation types are endemic, and Eastern Highveld Grassland is classified as Vulnerable while Wakkerstroom Montane Grassland is classified as Least Concern (SANBI 2018). The PAOI includes some low hills and wetland depressions and has largely been transformed by cultivation in the west, commercial forestry in the east and urban sprawl, including extensive areas of alien invasive trees. The PAOI is in a summer rainfall region and has a cool-temperate climate with dry winters, frequent occurrence of frost and large differences in both diurnal and seasonal temperature extremes (Mucina and Rutherford 2006).

Critical Biodiversity Areas (CBA), areas of high biodiversity value that must be maintained in a natural state, are located throughout the PAOI, classified as either “CBA Irreplaceable” and “CBA Optimal” (Figure 1). The former category comprises 1) areas required to meet conservation targets and those with irreplaceability values greater than 80 %, 2) areas which represent critical linkages or pinch-points in the landscape that must remain natural, and 3) Critically Endangered ecosystems (MTPA 2014). The latter category comprises areas that are not ‘irreplaceable’, but they are the most optimal land configuration to meet all biodiversity targets. Ecological Support Areas (ESA), not essential for meeting biodiversity targets but important in supporting the functioning of CBAs and delivering important ecosystem services, are also located throughout the PAOI.

Parts of the PAOI fall within a National Protected Areas Expansion Strategy (NPAES) Focus area (Moist Escarpment Grasslands), targeted for protected area expansion for improved ecosystem representation, ecological sustainability and resilience to climate change. Chrissiesmeer Protected Environment and Jericho Dam Nature Reserve overlap the north and east of the PAOI respectively (Figure 1).

Bat roosting sites in the PAOI are relatively limited and unlikely to support large congregations of bats, with no underground sites (e.g., caves, mines, sinkholes) known to be present. The closest known major bat roost is approximately 70 km north of the PAOI. Although occasional ridges and rocky outcrops are features of the landscape (Mucina and Rutherford 2006) these are not extensive. Some bat species could roost in these features. Bats are likely to roost in buildings associated with farmsteads within and bordering the AoI especially Cape Serotine and Egyptian Free-tailed Bat (Monadjem et al. 2020). Trees growing at these farmsteads and elsewhere on site where they form clumps, could also provide roosting spaces for bats, even though most are alien invasive species. Completed surveys of some buildings in the of the PAOI did not reveal the presence of roosting bats and as such were assessed as being of low relative suitability. However, these could be used by bats as night-roosts (locations used by bats to feed on captured prey, or to rest between foraging bouts) and should therefore still be considered, and avoided where possible, in the spatial planning.

Sensitive features in the PAOI at which bat foraging activity may be concentrated include farm buildings where they would forage for insects attracted to lighting (Rydell 1992, Jung and Kalko 2010), dams and wetland areas (Sirami et al. 2013), within and along the edge of woodland/tree patches, and over cultivated

areas (Bohmann et al. 2011, Noer et al. 2012). Free-tailed bats (Molossidae) will fly at high altitudes, and their foraging habitat is essentially all airspaces (McCracken et al. 2008, Nguyen et al. 2019).

Based on current taxonomic information and bat occurrence data, 23 species could occur within the PAOI (Table 2). The majority have a low likelihood of occurrence however the potential suite of species includes 10 high risk species, including fruit bats (Pteropodiae) and free-tailed bats (Molossidae) which are vulnerable to wind energy impacts in South Africa (MacEwan 2016, Aronson 2022).

Table 2: Bat Species Potentially Occurring within the PAOI

Common Name Species Name	Key Habitat Requirements*	Prob. Of Occurrence	Conservation Status		Wind Energy Risk[δ]
			IUCN[†]	RSA[‡]	
Natal Long-fingered bat *Miniopterus natalensis*	Temperate or subtropical species. Primarily in savannahs and grasslands. Roosts in caves, mines, and road culverts. Clutter- edge forager. Migratory.	**Confirmed (5,018 passes)**	LC/U	LC	**High**
Lessor Long-fingered bat *Miniopterus fraterculus*	Temperate species, associated with grasslands. Cave-dependant but also roosts in tunnels and mines. Habitat includes savannah bushveld, moister mistbelt and coastal forest habitats. Clutter-edge forager. Migratory.	Moderate	LC/U	LC	**High**
Cape Serotine *Laephotis capensis*	Arid semi-desert, montane grassland, forests, savannah and shrubland. Roosts in vegetation and human-made structures. Clutter-edge forager.	**Confirmed (50,243 passes)**	LC/S	LC	**High**
Mauritian tomb bat *Taphozous mauritianus*	Savannah woodland preferring open habitat. Roosts on rock faces, the outer bark of trees or on the outer walls of buildings under the eaves of roofs. Forages in urban areas and over cultivation. Open- air forager.	High	LC/U	LC	**High**
Little Free-tailed bat *Mops pumilus*	Semi-arid savannah, forested regions, woodland habitats. Roosts in narrow cracks in rock and trees but also in buildings. Open-air forager. Forages in urban areas and over cultivation.	**Confirmed (1,767 passes)**	LC/U	LC	**High**
Midas Free-tailed bat *Mops midas*	Hot low-lying savannah and woodland. Roosts in narrow cracks in rock and trees but also in buildings. Open-air forager.	Low	LC/D	LC	**High**
Egyptian Free-tailed bat *Tadarida aegyptiaca*	Desert, semi-arid scrub, savannah, grassland, and agricultural land. Roosts in rocky crevices, caves, vegetation, and human-made structures. Open-air forager.	**Confirmed (20,995 passes)**	LC/U	LC	**High**
Wahlberg's Epauletted fruit bat *Epomophorus wahlbergi*	Roost in dense foliage of large, leafy trees. Associated with forest and forest-edge habitats but will forage in urban environments.	Low	LC/S	LC	**High**
African Straw-coloured fruit bat *Eidolon helvum*	Non-breeding migrant in the PAOI.	Low	NT/D	LC	**High**
Egyptian Rousette *Rousettus aegyptiacus*	Distribution influenced by availability of suitable caves roosts.	Low	LC/S	LC	**High**
Temminck's Myotis *Myotis tricolor*	Montane forests, rainforests, coastal forests, savannah woodlands, arid thicket, and fynbos. Roosts communally in caves (and mines) and closely associated with mountainous terrain. Migratory. Clutter-edge forager.	Low	LC/U	LC	**Medium-High**
Welwitsch's Myotis *Myotis welwitschii*	Mainly open woodland and savannah but also high-altitude grassland, tropical dry forest, montane tropical moist forest, savannah and shrublands. Clutter-edge forager.	Low	LC/U	LC	**Medium-High**
Yellow-bellied house bat *Scotophilus dinganii*	Occurs throughout the Savannah Biome but avoids open habitats such as grasslands and Karoo scrub. Roosts in hollow trees and buildings. Clutter-edge forager.	**Confirmed (169 passes)**	LC/U	LC	**Medium-High**
Dusky Pipistrelle *Pipistrellus hesperidus*	Woody habitats, such as riparian vegetation and forest patches. Recorded roosting in narrow cracks in rocks and under the loose bark of dead trees. Clutter-edge forager.	Low	LC/U	LC	**Medium-High**
Rusty Pipistrelle	Savannah woodland and associated with open water	Low	LC/U	LC	**Medium-**

Pipistrellus rusticus	bodies. Roosts in trees and old buildings. Clutter-edge forager.				High
Long-tailed Serotine *Eptesicus hottentotus*	Montane grasslands, marshland and well- wooded riverbanks, mountainous terrain near water. Roosts in caves, mines, and rocky crevices. Clutter-edge forager.	**Confirmed (368 passes)**	LC/U	LC	**Medium**
Egyptian Slit-faced bat *Nycteris thebaica*	Savannah, desert, arid rocky areas, and riparian strips. Gregarious and roosts in caves but also in mine adits, Aardvark holes, rock crevices, road culverts, roofs, and hollow trees. Clutter forager.	Medium	LC/U	LC	**Low**
Geoffroy's Horseshoe bat *Rhinolophus clivosus*	Savannah woodland, shrubland, dry, riparian forest, open grasslands, and semi- desert. Roosts in caves, rock crevices, disused mines, hollow baobabs, and buildings. Clutter forager.	Medium	LC/U	LC	**Low**
Bushveld Horseshoe bat *Rhinolophus simulator*	Occurs in caves within areas of moist savannah, adjacent to rivers and savannah woodland, montane habitats, and coastal mosaics. Commonly associated with riparian forest and along wooded drainage lines. Roosts in caves and mines. Clutter forager.	Medium	LC/D	LC	**Low**
Blasius's Horseshoe bat *Rhinolophus blasii*	Savannah woodlands and are dependent on the availability of daylight roosting sites such as caves, mines, or boulder piles.Clutter forager.	Low	LC/D	NT	**Low**
Darling's Horseshoe bat *Rhinolophus darlingi*	Mesic woodland savannahs. Roosts in caves, boulder piles, mines, culverts, large hollow trees and disused buildings. Clutter forager.	Low	LC/U	LC	**Low**
Sundevall's Leaf-nosed bat *Hipposideros caffer*	Savannah, bushveld and/or coastal forests, near to rivers and other water sources. Roosts in caves, sinkholes, rock fissures, hollow trees, mines, and culverts. Clutter forager.	Low	LC/D	LC	**Low**
Percival's Short-eared Trident bat *Cloeotis percivali*	Savannah and woodland areas. Roosts in caves and mine tunnels. Clutter forager.	Low	LC/U	EN	**Low**

5.2 Pre-Construction Bat Monitoring Results

Six bat species were confirmed to occur in the PAOI (Table 2) including four species classified as high risk from wind energy development: Natal Long-fingered bat, Cape Serotine, Little Free-tailed bat, and Egyptian Free-tailed bat. All of these species have a conservation status of Least Concern (both globally and regionally) and no red data species with a higher conservation status were detected. Although these species are currently classified as Least Concern, Rodhouse et al. (2019), Davy et al. (2020) and Frick et al. (2017) have all shown that in North America, Least Concern bats may be experiencing impacts due to wind farms that could result in changes to their conservation status. The global population trend is unknown for Natal Long-fingered bat, Little Free-tailed bat, and Egyptian Free-tailed bat but stable for Cape serotine. Given the unknown population trends for some of these species and the evidence of impacts from wind farms, ongoing monitoring and adaptive management will be essential to ensure their conservation status does not deteriorate.

A total of 80,051[1] bat passes were recorded over 518 sample nights. Most activity was attributed to Cape serotine (63 %) and Egyptian free-tailed bat (27 %). These species comprise the majority of bat fatalities at South African wind farms (Aronson 2022). Natal long-fingered bat accounted for 6 % of total activity. The remaining three species (Little free-tailed bat, Long-tailed serotine and Yellow-bellied house bat) were seldomly recorded and the magnitude of their activity suggests they would be at low risk of impacts. As such, the remainder of this section focuses on impacts to Egyptian free-tailed bat, Cape serotine and Natal long-fingered bat.

Based on MacEwan et al. (2020b), Cape serotine activity was predominantly low but high activity was recorded at AM5, AM8, AM9 and AM11, in summer and autumn (Table 3). The latter two monitoring stations were located at a farm dam and at a farmstead respectively indicating higher activity in relation to

[1] Exclusive of an additional 1,491 bat passes unable to be identified to a species.

these landscape features. This species was also recorded at 50 m and 90 m but the magnitude of its activity was mostly low except for at AM3-50 during March and April when its activity suggests medium risk. Based on the dataset, this species is largely predicted to be at low collision risk. However, bats in the same family (Vespertilionidae) are known to be attracted to wind turbines in the United Kingdom (Richardson et al. 2021). Thus, although the data suggest a low collision risk, the installation of wind turbines in the landscape can alter bat activity patterns. Collision risk for this species will also depend on how close turbine blades reach the ground, with risk increasing the closer the blades reach the ground (Garvin et al. 2024).

Table 3: Median number of bat passes per hour per night for Cape serotine and associated risk based on MacEwan et al. (2020b).

AM11	25.90	20.76	12.50	6.14	3.10							15.07	

The timeseries data indicate a clear seasonal pattern in bat activity for the Cape serotine (Table 4), with the mean number of bat passes per hour peaking significantly during summer, reaching up to 13.66 passes per hour. This is largely driven by activity at AM11 and AM9. This heightened activity in summer likely reflects optimal weather conditions and increased prey availability. In autumn, bat activity remains relatively moderate, with values between 0.02 and 3.48 passes per hour, suggesting continued but reduced presence compared to summer. In contrast, winter and spring exhibit notably lower levels of activity, with mean passes per hour not exceeding 1.17 in spring and 0.68 in winter. This seasonal trend suggests that Cape serotine bats are minimally active during colder months, likely due to reduced foraging opportunities or temperature constraints. Additionally, within each season, there is a gradual decrease in bat passes across a night. Peak activity in summer and spring is between 19:00 and 21:00, in autumn between 18:00 and 20:00, and in winter between 17:00 and 19:00.

Table 4: Heatmap showing the mean number of bat passes per hour for Cape serotine. Colour gradient is relative and not based on thresholds.

Time Period	Autumn	Spring	Summer	Winter

The data showed that at 50 m and 90 m, moderate collision risk is predicted for Egyptian free-tailed bat apart from during autumn and spring when high risk is predicted (Table 5). High risk is predicted near AM11 in autumn, and AM4 and AM5 during spring. Egyptian free-tailed bat is flexible in its foraging strategy, and it is thought that the habitat below has little influence on this species (Monadjem et al. 2020). These bats are open-air foragers based on their morphology and echolocation (Norberg and Rayner 1987) which means they tends to forage high in the air.

Table 5: Median number of bat passes per hour per night for Egyptian free-tailed bat and associated risk based on MacEwan et al. (2020b).

In spring, Egyptian free-tailed bat shows the highest activity levels overall, with peak passes per hour occurring around midnight (00:00 – 01:00) at 1.4 passes per hour (Table 6). This elevated activity during

spring nights aligns somewhat with the Cape serotine data, where spring showed moderate activity; however, for the Egyptian free-tailed bat, spring is a clear peak season. In summer, activity for the Egyptian free-tailed bat is relatively lower compared to spring, with values not exceeding 0.57 passes per hour and generally concentrated in the earlier hours of the night. This is a notable contrast to Cape serotine, which displayed its highest seasonal activity in summer. This suggests that while the Cape serotine is more active during summer, the Egyptian free-tailed bat is less active during this period, potentially indicating differing ecological preferences or behavioural patterns. Autumn displays a moderate level of activity for the Egyptian free-tailed bat, with values peaking around 20:00 – 21:00 at 0.78 passes per hour and then gradually decreasing through the night. This pattern is consistent with the Cape serotine, where autumn also showed moderate activity. In winter, the Egyptian free-tailed bat shows low activity levels across all hours, with peak activity reaching only 0.36 passes per hour early in the evening (18:00–19:00) and decreasing to nearly zero later at night. This aligns with the winter results for the Cape serotine bat, confirming that winter is a low-activity season for both species.

Table 7: Median number of bat passes per hour per night for Natal long-fingered bat and associated risk based on MacEwan et al. (2020b).

Activity of Natal long-fingered bat was predominantly low but high activity was recorded during spring at AM1 and AM9. Medium activity was also recorded during spring at AM5 and AM11 (Table 7). As such, overall impacts to this species are anticipated to be low, especially since activity levels at 50 m and 90 m were assessed as low based on criteria in MacEwan et al (2020b). However, this species may experience high cumulative impacts (see Section 6.3).

06:00 – 07:00	0.00	0.00	0.00	0.00

The timeseries data showed that this species exhibits relatively low and stable activity levels across all seasons, with a modest peak in autumn, where its activity reaches a maximum of 0.69 bat passes per hour between 21:00 and 22:00. This peak, though limited, suggests a slight preference for early evening hours in the autumn months. Throughout spring, summer, and winter, however, the Natal long-fingered bat maintains very low activity, rarely exceeding 0.35 passes per hour at any given time. The hourly distribution shows that this species activity slightly tapers off in the late evening and early morning hours, with a marked decline around midnight. This pattern suggests that the Natal long-fingered bat may have brief foraging periods early in the night, possibly returning to roost sites earlier than other nocturnal species. This species is migratory, and although difficult to show, the peak in activity in autumn could be suggestive of some bats (e.g. females) moving through the site to roosting sites north elsewhere in Mpumalanga or Limpopo after mating.

6 IDENTIFICATION AND ASSESSMENT OF IMPACTS

Impacts to bats that are likely to occur because of the construction, operation and decommissioning of the wind energy facility and grid connection are identified and assessed in the following section. The unit of analysis against which impacts were assessed is the local bat community and their associated habitats within the PAOI. Impacts considered for assessment include habitat modification and disturbance, displacement, fatality due to collisions with wind turbine blades, and light pollution since these are the major impacts likely to be associated with the project (Kunz et al. 2007b, Cryan and Barclay 2009, Bará and C. Lima 2024, Voigt et al. 2024). For each impact, the respective mitigation measures were categorised into those aimed at first avoiding impacts, then minimising impacts, and finally restoring areas impacted (Figure 2).

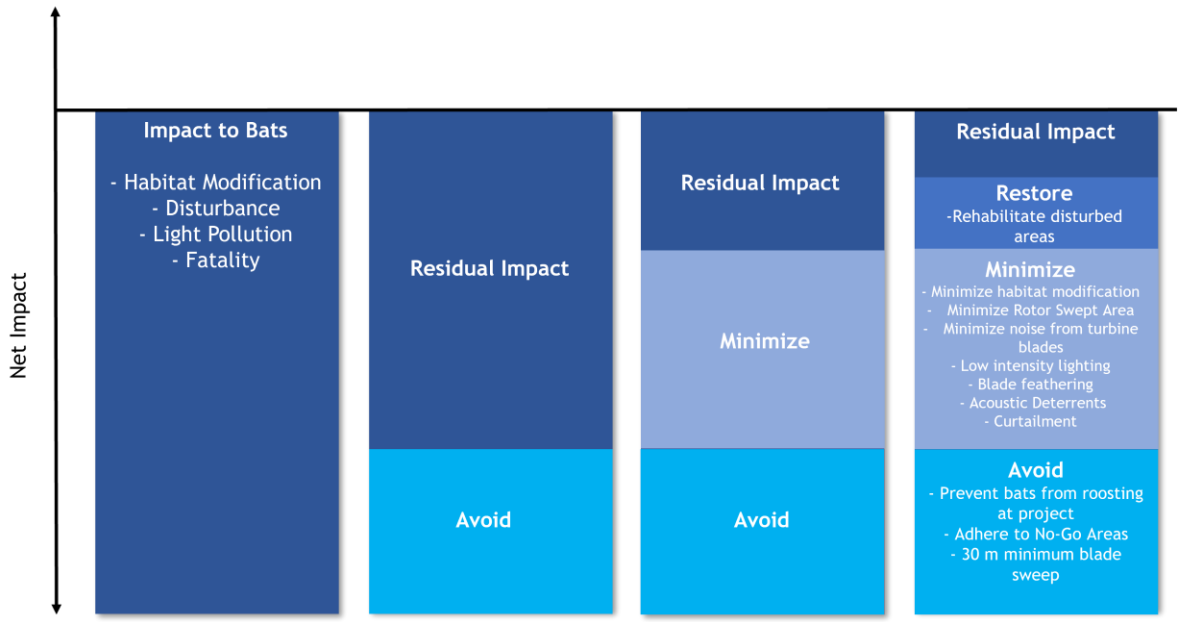

Figure 2: Mitigation Hierarchy applied to the Project with Mitigation Measures.

6.1 Wind Energy Facility

6.1.1 Construction Phase

IMPACTS

Removal of native vegetation, noise and dust generated during construction activities, and the presence of new infrastructure in the landscape, will negatively and indirectly impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement (Kunz et al. 2007b, Millon et al. 2015, Millon et al. 2018, Bennun et al. 2021, Leroux et al. 2022, Tolvanen et al. 2023).

Construction of WEF infrastructure could result in destruction (direct impact) of bat roosts (rocky crevices, buildings) and disturbance (indirect impact) of bat roosts potentially resulting in roost abandonment. Bat mortality can occur if roosts which contain bats are destroyed. Installation of new infrastructure in the landscape (e.g., buildings, turbines, road culverts) can provide new roosting spaces for some bat species, attracting them to areas with wind turbines and potentially increasing the likelihood of collisions.

Mitigation (Avoid)

Habitat modification impacts can be avoided by buffering habitat and landscape features (Table 8) that bats use to spatially limit the potential for bats to interact with project infrastructure, and to avoid impacting key bat habitat (Barré et al. 2018, Leroux et al. 2022). All key habitat features were buffered by 200 m as per best practise (Rodrigues 2015, MacEwan et al. 2020b).

To align with regional conservation and integrated development planning, the Mpumalanga Biodiversity Sector Plan Handbook (MTPA 2014) was consulted to guide spatial risk in the AoI. The intention was to align biodiversity conservation policy objectives with renewable energy policy objectives, attempting to minimize trade-offs between conflicting goals (Jackson 2011, Gasparatos et al. 2017). The handbook includes a map of terrestrial areas that are important for conserving biodiversity and ecological processes – Critical Biodiversity Areas (CBAs) and Ecological Support Areas (ESAs) respectively.

CBA Irreplaceable Areas were categorised as No-Go (Table 8) because the conservation goals for these areas are to maintain them in a natural state with no loss of ecosystems, functionality or species, and with no flexibility in land-use options (MTPA 2014). CBA optimal and areas with Highveld grassland were classified as high risk. Although the primary objective of the CBA optimal areas is to maintain these spaces in a natural state with no loss of ecosystems, functionality or species, some flexibility in land-use options is permitted (MTPA 2014), therefore these areas must be avoid as much as possible. The remaining areas were assigned low or medium risk where all infrastructure development should be prioritized. These included modified land, areas with invasive alien trees (plantations), ESA, and other Natural Areas (Table 8). Similarly, in ecological supports areas (ESAs), the objective is to maintain habitats in a natural, or near-natural, state with limited loss of ecosystems or functionality. Hence, these areas were classified as medium risk, permitting the siting of turbines in these spaces.

All turbines will be subjected to a post-construction bat fatality monitoring program which will monitor residual impacts at turbines located in CBA optimal and ecological support areas, as well as turbines in low-risk areas. The results of this monitoring will inform management actions where needed to ensure alignment with the MTPA objectives to limit impacts to biodiversity.

Table 8: Features used to assign spatial risk categories in the AoI for bats (Chiroptera)

Risk Level			
Low	**Medium**	**High**	**No-Go**
Heavily modified land	NPAES	CBA Optimal	CBA Irreplaceable Areas
Moderately modified land	ESA Landscape corridor	Highveld Grassland	Minor Watercourses (50 m buffer)
Cleared Invaded	ESA Local corridor		Farm Dams (200 m buffer)
Transformed	Other Natural Areas		Pan depressions (200m buffer)
Plantation/Invaded	Montane Grassland		Houses (200 m buffer)
			Buildings (200 m buffer)
			Seeps (200 m)

			CVB Wetlands (200 m)
			Rivers with floodplains (200 m buffer)
			Rocky Outcrops (200 m buffer)
			Protected Areas (200m buffer)

No infrastructure (including O&M buildings) may be placed within buffered No-Go areas (Figure 3). However, road infrastructure may need to be routed through sensitive areas for practical reasons. Existing road networks should be used as much as possible in these cases to limit the creation of additional roads which have known impacts on wildlife (Perumal et al. 2021).

To avoid bats roosting in new project infrastructure, all buildings must be properly sealed to prevent bats from roosting. If bats colonize these spaces, a suitably qualified bat ecologist must be engaged to remove them.

Disturbance effects can be avoided by restricting construction activities to daylight hours (i.e., no construction at night) and avoiding blasting near rocky outcrops.

Mitigation (Minimize and Restore)

Modification and disturbance of bat habitat is likely to have species specific effects depending on species foraging guild, season, and distance to wind turbines (Barré et al. 2018, Leroux et al. 2022). For example, clutter edge species (e.g., Cape serotine) are more likely to be impacted by habitat modification given their greater association with physical habitat features compared to high-flying species (e.g., Egyptian free-tailed bat). As such, buffers may not be effective to fully remove all impacts.

Beyond avoidance, measures to minimize further impacts include minimizing the clearing of native vegetation, minimizing disturbance and destruction of rocky outcrops, and applying good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. Where native trees, rocky outcrops or buildings need to be removed (although this must be avoided), these features must be examined by a suitably qualified bat ecologist before construction commences to search for roosting bats. Following construction, all areas disturbed must be rehabilitated through native species planting within all areas under the projects control.

IMPACT PHASE: CONSTRUCTION					
Nature of the impact: MODIFICATION & DISTURBANCE OF BAT HABITAT (ROOSTING, FORAGING, COMMUTING)					
Description of impact Removal of native vegetation, noise and dust generated during construction activities, and the presence of new infrastructure in the landscape, will negatively and indirectly impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement. Construction of WEF infrastructure could result in destruction and/or disturbance to bat roosts, and inadvertently provide new roosting spaces for some bat species in risky locations.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	1	1	3	2	2
With Mitigation	1	1	2	1	1
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	**Low Negative Impact (14)**			**Low Negative Impact (5)**	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: - Limit potential for bats to roost in project infrastructure (e.g., buildings, turbines) by ensuring they are properly sealed such that bats cannot gain access. - No construction activities at night. - No placement of infrastructure (except roads) in no-go areas.					

- No blasting near rocky crevices. - Minimize clearing of native vegetation - Minimize disturbance and destruction of rocky outcrops, native trees and buildings, and where this is required, these features should be examined for roosting bats. - Apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).	
Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).

6.1.2 Operational Phase

IMPACTS

Bat mortality (direct impact) through collisions with wind turbine blades is the principal impact of wind energy facilities on bats during operation of the facility (Cryan and Barclay 2009, Arnett et al. 2016, Voigt et al. 2024). Displacement of bats from their preferred areas may also occur due to turbine noise emissions (Ellerbrok et al. 2024, Voigt et al. 2024).

Mitigation (Avoid)

Collisions can be avoided by not placing wind turbines in the vicinity of bat habitats which for bats includes both physical landscape features themselves (near wetlands, vegetation etc.) and open airspace away from these features (Schnitzler et al. 2003). Risk of collision impact is related to bat morphology with fast flying, open-air species more likely to be impacted than low-flying species who forage closer to the ground, in edge spaces near vegetation, or in dense cluttered spaces (Schnitzler et al. 2003, Thaxter et al. 2017, Aronson 2022). Impacts to low-flying species can be further avoided by ensuring blades do not sweep close to ground level (Figure 4).

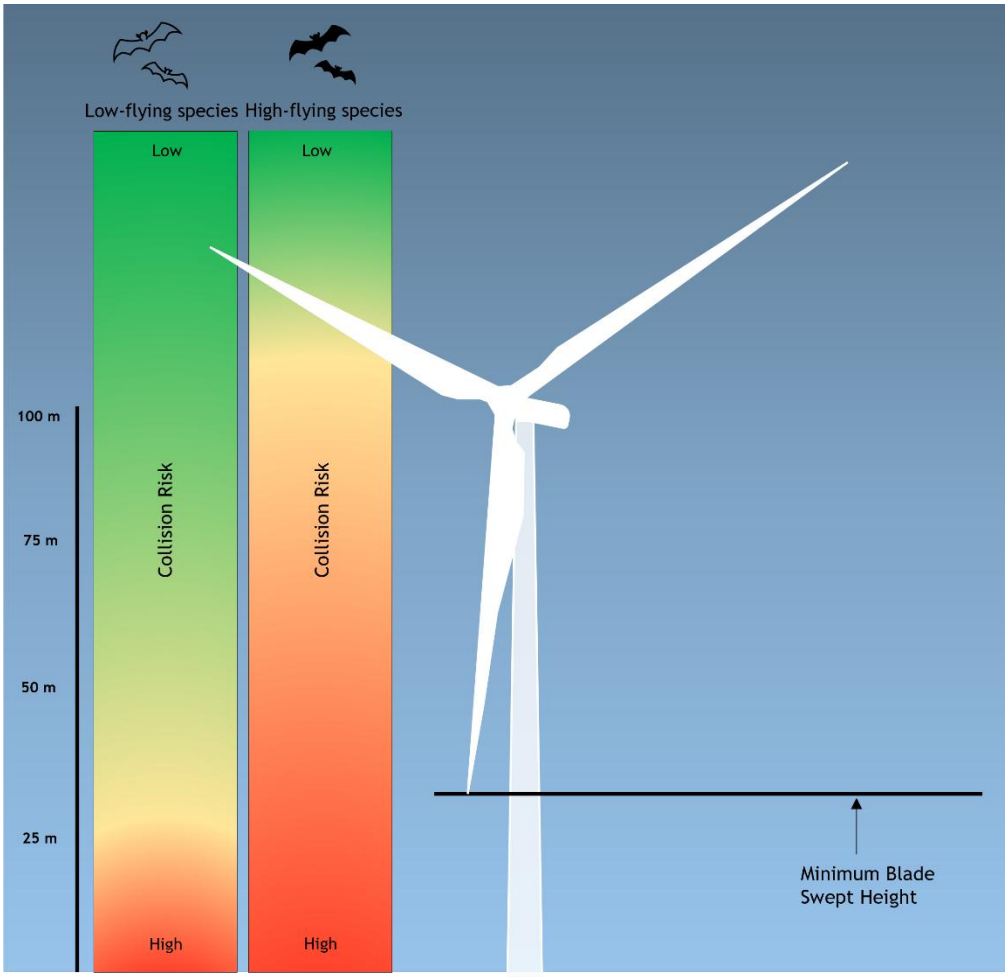

Figure 4: Conceptual Framework used to differentiate risk between low and high-flying bat species and the relationship with turbine size.

The species principally at collision risk from the proposed project are Cape serotine and Egyptian free-tailed bat since other species were recorded less often. High risk was identified for Cape serotine at ground level (represented by 10 m) at some locations (Table 3) but generally low risk at height (above 50 m). Activity is likely to decrease exponentially between these two heights (Wellig et al. 2018) meaning risk would decrease from high at 10 m to low at 50 m and above. The size of the rotor swept area should account for this because the lower the blades sweep the ground, the higher risk they will present to bats (Garvin et al. 2024). It is therefore recommended to maintain a minimum blade sweep of 30 m to avoid collision impacts as much as possible. There is limited published emperical evidence for this specific height but based on the activity of Cape serotine this is likely to be a reasonable height were risk would reduce from high to moderate or low.

Collision impacts can also be avoided by not installing wind turbines within or adjacent to key bat habitats, and adhering to the No-Go buffers (Figure 3). To ensure no parts of the wind turbines, including the blade tips, intrude into bat buffers, all 200 m buffers were adjusted (increased by 49 m) to account for the blade length and hub height of the assessed turbine in line with Mitchell-Jones and Carlin (2014) and based on the following equation:

[Eq. 1]

$$b = \sqrt{(buffer + bl)^2 - (hh - fh)^2}$$

$$b = \sqrt{(200 + 91)^2 - (150 - 0)^2}$$

$$b = 249\ m$$

Where:
b = adjusted/blade tip buffer
buffer = 200 m
bl: Turbine blade length = 91 m
hh: Hub height = 150 m
fh: Feature height = 0 m

The specific turbine height assessed in this report has a 150 m hub height and 91 m blade length, resulting in a minimum blade sweep of 59 m. Should the turbine size change, the adjusted/blade tip buffers must be updated to account for any changes in the hub height or blade length. No turbines are within buffered areas and hence the turbine layout is acceptable in its current form (Figure 3).

Mitigation (Minimize and Restore)

For some high-flying species such as Egyptian free-tailed bat, the habitat or land use below does not generally influence their activity (Monadjem et al. 2020) which makes habitat based mitigations (e.g., buffers) less effective. This species was recorded at 50 m and 90 m, where median activity levels suggest high risk during autumn and spring (Table 5). Mitigation to avoid impacts to higher-flying species should include the choice of turbine design since this has the potential to influence bat fatality (Barclay et al. 2007) but the impact of turbine size on bat fatality is poorly understood. Generally, impacts to high-flying species should be avoided by limiting the size of the rotor swept area as much as practicable since they are active across much of the rotor swept zone.

However, due to the characteristics of the species present on site, i.e., high risk, open-air foraging species, residual impacts could occur since there is still likely to be a high degree of risky airspace even with a minimized rotor swept area. In addition, some bats may be attracted to turbines (Horn et al. 2008, Cryan and Barclay 2009, Richardson et al. 2021, Guest et al. 2022, Leroux et al. 2022) once installed and operational and therefore additional mitigation measures would be needed to minimize impacts.

The first additional mitigation measure to minimize residual collision impacts is the use of **blade feathering** to prevent free-wheeling of blades below the turbine cut-in speed. This has been shown to reduce bat fatality with the benefit of not impacting on energy production (Young et al. 2011, Good et al. 2012).

During operation, bat fatality monitoring must be undertaken to search for bat carcasses beneath wind turbines to measure the residual impact of the WEF on bats for a minimum of two years (Aronson et al. 2020). Mitigation measures that are known to further minimize bat fatality if needed based on the fatality monitoring results include **curtailment** and/or **acoustic deterrents** (Arnett et al. 2013, Romano et al. 2019, Weaver et al. 2020). These techniques must be used if post-construction fatality monitoring indicates that species fatality thresholds have been exceeded (MacEwan et al. 2018) to minimize impacts, maintain the impacts to bats within acceptable limits of change and prevent declines in the impacted bat population. The bat fatality thresholds for the project were determined based on area of influence of the turbines of 2,007 hectares. This was based on a minimum convex polygon around all turbines, plus an additional buffer around this space of 110 m corresponding to the turbine blade length. Based on the bat fatality threshold for the Highveld Grasslands ecoregion (MacEwan et al. 2018), the bat fatality threshold for the Emvelo project is 16 bats per least concern species.

According to the threshold guidance (MacEwan et al. 2018), should the annual fatality threshold be exceeded, curtailment and/or acoustic deterrents must be used to reduce fatality levels to below the threshold. For frugivorous bats, conservation important or rare/range restricted bats, i.e., Species of Special Concern (SSC), the annual fatality threshold is 1 individual. The likelihood of SSC's being present on site is low (Table 2).

A Biodiversity Management Plan (BMP) for bats must be developed by a bat ecologist before commencement of operation which includes the post-construction fatality monitoring plan design, fatality thresholds calculations and rationale, and an adaptive management response plan that provides a timeous action pathway for mitigation (e.g. curtailment or deterrents) should fatality thresholds be exceeded. Smart curtailment approaches which shut down turbines based on real time bat acoustic activity data are favoured over blanket curtailment because these will be less disruptive to turbine operation.

Since displacement of bats is likely driven by turbine noise, this can be minimized by serration of the back edges of the blade, by using a low-noise blade airfoil design or with blade trailing-edge brushes (Bošnjaković et al. 2024; Ellerbrok et al. 2024).

IMPACT PHASE: OPERATION					
Nature of the impact: BAT FATALITY					
Description of impact Bat mortality (direct impact) through collisions and/or barotrauma with wind turbine blades is the principal impact of wind energy facilities on bats.

Mitigation measures to reduce residual risk or enhance opportunities: - No placement of turbines and infrastructure (apart from roads and the OHL) within no-go areas - Maintain a minimum blade sweep of 30 m to avoid impacts to lower flying bats such as clutter-edge species (e.g., Cape serotine, Natal long-fingered bat). - Minimize the rotor diameter - Feather blades to prevent free-wheeling below the turbine cut-in speed - Implement post-construction fatality monitoring and apply smart curtailment or deterrents if fatality thresholds are exceeded.					
Residual impact	Curtailment and deterrents can successfully reduce bat fatality (Arnett 2011, Arnett et al. 2016, Weaver et al. 2020), but not completely. Through the application of fatality thresholds, residual impacts should be minimized.				

IMPACT PHASE: OPERATION					
Nature of the impact: DISPLACEMENT					
Description of impact Avoidance of wind turbines by bats, in some cases over several hundred meters distance, has been observed for various species in different habitats, including farmland, resulting in displacement impacts (Tolvanen et al. 2023, Voigt et al. 2024). Displacement, likely caused by wind turbine operation (e.g., wake turbulences and noise emissions), tends to increase with the number and size of turbines.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**

Mitigation measures to reduce residual risk or enhance opportunities:					

- Reduce turbine noise emissions by serration of the back edges of the blade, by using a low-noise blade airfoil design or with blade trailing-edge brushes (Bošnjaković et al. 2024; Ellerbrok et al. 2024).	
Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).

6.1.3 Decommissioning Phase

IMPACTS

Impacts during the decommissioning phase will be indirect and involve disturbance to bats through excessive noise and dust, and damage to vegetation.

Mitigation (Avoid)

Disturbance effects can be avoided by restricting decommissioning activities to daylight hours (i.e., no works at night).

Mitigation (Minimize and Restore)

Disturbance can be minimized by applying good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning works. All areas disturbed must be rehabilitated through native species planting within all areas under the projects control.

IMPACT PHASE: DECOMMISSIONING					
Nature of the impact: DISTURBANCE OF BATS

Mitigation measures to reduce residual risk or enhance opportunities: - No decommissioning activities at night. - Apply good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning activities. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).					
Residual impact	Residual impacts are likely to be minor since ceasing project activities on site is likely to benefit bats.				

6.2 Grid Connection

6.2.1 Construction Phase

The direct impact of grid connection infrastructure is collisions with powerlines. Insectivorous bats are unlikely to collide with powerlines since they can avoid these obstacles using echolocation but fruit bats do collide with powerlines (Tella et al. 2020). The likelihood of occurrence for fruit bats species in the AoI

is low (Table 2). Indirect impacts include loss of habitat to construct substations and OHL pylons, and ecological light pollution (Longcore and Rich 2004).

IMPACT PHASE: CONSTRUCTION					
Nature of the impact: MODIFICATION & DISTURBANCE OF BAT HABITAT (ROOSTING, FORAGING, COMMUTING)					
Description of impact Vegetation clearing for grid connection infrastructure (access roads, substation buildings, pylons), as well as noise and dust generated during the construction phase, will impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement (Kunz et al. 2007b, Millon et al. 2018, Bennun et al. 2021). This impact is likely to have species specific effects; clutter edge species (e.g., Cape serotine) are more likely to be impacted by habitat modification given their greater association with physical habitat features compared to high-flying species (e.g., Egyptian free-tailed bat). Construction of grid connection infrastructure could result in destruction (direct impact) of bat roosts (trees, buildings) and disturbance (indirect impact) of bat roosts potentially resulting in roost abandonment. Bat mortality can occur if roosts which contain bats are destroyed. Installation of new infrastructure in the landscape (e.g., buildings) can inadvertently provide new roosting spaces for some bat species, attracting them to areas with wind turbines and potentially increasing the likelihood of collisions.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	1	1	3	2	2

Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: - Limit potential for bats to roost in project infrastructure (e.g., buildings) by ensuring they are properly sealed such that bats cannot gain access. - No construction activities at night. - No placement of pylons within 200 m of key habitat features specifically including buildings, dams/wetlands, and rivers/streams. The OHL itself is permitted to cross over No-Go Areas for practical routing reasons but pylon positions must avoid No-Go Areas where feasible. Therefore the maximum possible span should be implemented to avoid the sensitive area while ensuring the technical feasibility of the development. - No blasting near rocky crevices. - The construction compounds, laydown areas, and batching plants must avoid No-Go areas. - Minimize clearing of native vegetation - Minimize disturbance and destruction of rocky outcrops, native trees and buildings, and where this is required, these features should be examined for roosting bats. - Apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).					
Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).				

6.2.2 Operational Phase

IMPACT PHASE: OPERATION
Nature of the impact: LIGHT POLLUTION

Description of impact
Construction of grid infrastructure will increase ecological light pollution from artificial lighting associated with the substation and other operational and maintenance buildings. Light pollution can alter ecological dynamics (Horváth et al. 2009). Lighting attracts and can cause direct mortality of insects, reducing the prey base for bats, especially bat species that are light-phobic. These species may also be displaced from previous foraging areas due to lighting. Other bat species forage around lights, attracted by higher numbers of insects. This may bring these species into the vicinity of the project and indirectly increase the risk of collision with wind turbines.

	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)
Without Mitigation	3	4	3	3	3
With Mitigation	3	4	2	2	2

Significance Calculation	Without Mitigation	With Mitigation
S=(E+D+R+M)*P	**Moderate Negative Impact (39)**	**Low Negative Impact (22)**
Was public comment received?	No	
Has public comment been included in mitigation measures?	No, no comments received	

Mitigation measures to reduce residual risk or enhance opportunities:
- No placement of substations and operational and maintenance buildings within no-go areas. - Avoid excessive lighting - Use of motion-sensor lighting, avoid sky-glow by using hoods and downward facing lighting, increase spacing between lighting units, and use low pressure sodium lights (Rydell 1992, Stone 2012).

Residual impact	Given the limited extent of light pollution currently in the region, the application of the above mitigation measures is likely to result in minor residual impacts.

6.2.3 Decommissioning Phase

IMPACT PHASE: DECOMMISSIONING
Nature of the impact: DISTURBANCE OF BATS
Description of impact Impacts during the decommissioning phase will be indirect and involve disturbance to bats through excessive noise and dust, and damage to vegetation.

	Extent (E)	Duration (D)	Reversibility (R)	Magnitude (M)	Probability (P)
Without Mitigation	1	1	3	3	3
With Mitigation	1	1	2	2	2

Significance Calculation	Without Mitigation	With Mitigation
S=(E+D+R+M)*P	**Low Negative Impact (24)**	**Low Negative Impact (12)**
Was public comment received?	No	
Has public comment been included in mitigation measures?	No, no comments received	

Mitigation measures to reduce residual risk or enhance opportunities:
- No decommissioning activities at night. - Apply good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning activities. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).

Residual impact	Residual impacts are likely to be minor since ceasing project activities on site is likely to benefit bats.

6.3 Cumulative Impacts

For the purposes of the cumulative impact assessment (CIA), cumulative impacts are defined as the total impacts resulting from the successive, incremental, and/or combined effects of a project when added to other existing, planned and/or reasonably anticipated future projects, as well as background pressures (IFC 2013). The project considered here is the Emvelo Wind Energy Facility. The goal of this assessment is to evaluate the potential resulting impact to the vulnerability and/or risk to the sustainability of the bat species affected (IFC 2013).

6.3.1 Step 1: VECs and spatial-temporal boundary

Following guidance in IFC (2013), the first step in the CIA was to determine the Valued Environmental Components (VECs), the bat species most likely to be affected by cumulative impacts, and the temporal and geographic scope of the analysis.

Of the species recorded in the PAOI during the acoustic monitoring, and based on bat distribution records (ACR 2020), Cape serotine (*Laephotis capensis*), Natal long-fingered (*Miniopterus natalensis*) and Egyptian free-tailed bat (*Tadarida aegyptiaca*) are most likely to be impacted cumulatively. This is because they are the most widespread bat species in South Africa (Monadjem et al. 2020), classified as high risk species to wind energy impacts (MacEwan et al. 2020b), the most impacted by operating wind energy facilities in the country (Aronson 2022).

The temporal time frame over which cumulative impacts are considered was 25 years, the typical lifespan of a renewable energy facility. However, cumulative effects could extend beyond this timeframe if development of the cluster of three projects is phased over time.

The Ecologically Appropriate Area of Analysis (EAAA) for the assessment was determined by considering the ecology of the three VECs.

The acoustic monitoring confirmed the presence of Natal long-fingered bat in the PAOI, a migratory species which moves seasonally between winter hibernacula and summer maternity cave roosts in South Africa (van der Merwe 1975, Miller-Butterworth et al. 2003). In north-eastern South Africa, where the proposed development is planned, van der Merwe (1975) showed migration between maternity caves in Limpopo and hibernacula caves in Gauteng/North-West undertaken by pregnant females (who later return south with weaned pups), with caves separated by 150 km at least. Males typically undertake shorter movements (> 60 km) between various highveld caves (van der Merwe 1975). This migration increases the potential that these bats will encounter wind turbines or be displaced by them (Millon et al. 2018), especially if these are placed along migratory routes. Although these movements are typically north-south, Pretorius et al. (2020) suggest that movement could also occur east-west between Gauteng and a maternity cave in Sudwala, Mpumalanga, a distance of approximately 250 km. Although additional research is needed to better understand long and short distance movements of Natal long-fingered bat in South Africa more precisely, given the numerous roost sites (both caves and mines) in Mpumalanga and body of work already demonstrating or suggesting migratory behavior in the north-east of the country between these sites, it is reasonable that cumulative impacts of wind energy may impact this species at large scales and hence cumulative impacts need to be assessed accordingly. Based on van der Merwe (1975), a 150 km radius around the PAOI was therefore defined as EAAA1 (Figure 5), especially since cumulative impacts should be evaluated across scales potentially affected species are likely to occur (Voigt et al. 2012, Lehnert et al. 2014).

The remaining VECs are not migratory and hence a second, smaller EAAA was used. Data on the spatial ecology of the Egyptian free-tailed bat and Cape serotine, specifically the sizes of their foraging or community ranges, are not available. Data from European free-tailed bat, *Tadarida teniotis*, in Portugal (Marques et al. 2004) and Serotine bat, *Eptesicus serotinus*, in England (Robinson and Stebbings 1997) were used as surrogates. Feeding areas for some *T. teniotis* individuals were over 30 km from their roost while the maximum distance between *E. serotinus* feeding areas was over 41 km.

Cumulative impact assessment in South African typically consider developments within a radius of 35 km which therefore is potentially in line with the movement ecology of the two VECs. Hence the EAAA2 was a 35 km radius around the PAOI.

6.3.2 Step 2: Other Activities and External Drivers

The second step in the CIA was to identify other past, existing, or planned activities within the EAAA1 and EAAA2 and to assess the external influences and stressors on the three VECs. With reference to the Renewable Energy Application database (Q2, 2024), currently two others wind energy projects are located within the EAAA2 including the Sheepmoor WEF. Approximately 35 other development projects are located within EAAA1 (Figure 5). Given that EAAA1 also includes a Renewable Energy Development Zone (REDZ), it is reasonable to expect further development over the 25-year period considered in this assessment.

There are no documented major past threats to Egyptian free-tailed bat and Cape serotine or current threats to them other than renewable energy (Child et al. 2016). Egyptian free-tailed bats can also be threated indirectly by roost disturbance, especially caves. This CIA considers renewable energy the primary impact to these VECs. Natal long-fingered bat is locally threatened in parts of its range by habitat loss resulting from conversion of land to agricultural use, incidental poisoning with insecticides, loss of prey base, and the disturbance of roosting and maternity caves (Child et al. 2016).

6.3.3 Step 3: Baseline Status of VECs

Egyptian free-tailed bat is very widely distributed, locally common and recorded from many protected areas in South Africa however, although the population is stable, the population size is unknown (Child et al. 2016). It is classified as Least Concern nationally and globally. This species is present in the PAOI and based on its activity levels, it is at high risk of collision during autumn and spring (Table 5). It is flexible in its habitat requirements and one reason for its wide distribution is its affinity to roost in buildings or other man-made structures (Monadjem et al. 2020).

Cape serotine is also widely distributed in South Africa with a large population and hence is classified as Least Concern nationally and globally. However, it is possible that this species comprises a complex of closely related species (Monadjem et al. 2020). The population trend is stable, but the population size is unknown. Although this species is present in the PAOI its activity levels suggest low risk of collision (Table 3) although no data between 10 m and 50 m were recorded on site to verify this. This species was recorded at 50 m, so it is reasonable to assume some level of risk between 10 m and 50 m. Cape serotine is also flexible in its habitat requirements and its use of buildings and other anthropogenic structures as roosts has possibly led to its numbers increasing.

Natal long-fingered bat is a common and widespread species, classified as Least Concern nationally and globally with a stable national population, but it may be experiencing local declines (Child et al. 2016). The size of the national population is unknown but this species roosts in large colonies; De Hoop Guano cave in the Western Cape hosts approximately 200,000 individuals, and in the Highveld, some caves may contain up to 4000 individuals (Child et al. 2016). Activity levels of this species in the AoI were relatively low and this species was seldomly recorded in the rotor swept area but high activity was recorded closer to ground level in spring (Table 7).

6.3.4 Step 4: Assess Cumulative Impacts on VECs

The key potential impacts that could affect the long-term sustainability and/or viability of the three VECs in EAAA1 and EAAA2 are collisions with wind turbines. This may lead to local extinctions and fragmentation of the national population since bats have low reproductive rates (Barclay and Harder 2003). Other impacts may include displacement from foraging and commuting areas, and along migration routes, due to wind turbines (Millon et al. 2018, Leroux et al. 2022).

6.3.5 Step 5: Assess Significance of Predicted Cumulative Impacts

Rodhouse et al. (2019), Davy et al. (2020) and Frick et al. (2017) have all shown that in North America, Least Concern bats may be experiencing impacts due to wind farms that could result in changes to their conservation status. This may be a future scenario for widespread, common Least Concern bats species in South Africa. As such, the significance of cumulative impacts is assessed as High without mitigation. The application of mitigation measures is anticipated to reduce the overall cumulative impact of the project to a moderate level.

Nature of the impact: CUMULATIVE IMPACTS					
Description of impact The total impacts resulting from the successive, incremental, and/or combined effects of the project when added to other existing, planned and/or reasonably anticipated future projects, as well as background pressures.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	3	4	3	4	5
With Mitigation	3	4	2	3	3
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	**High Negative Impact (70)**			**Moderate Negative Impact (36)**	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: The mitigation measures proposed in this report (buffering key habitats used by bats, use of appropriate lighting technology, blade feathering, and using smart curtailment and/or acoustic deterrents) should be applied to all future projects so that there is a collective management responsibility (IFC 2013).					
Residual impact	Curtailment and deterrents can successfully reduce bat fatality (Arnett 2011, Arnett et al. 2016, Weaver et al. 2020), but not completely. Through the application of fatality thresholds across all projects in the cumulative impact area, residual impacts should be minimized.				

6.3.6 Step 6: Management of Cumulative Impacts

Management interventions for bats at operating wind farms in South Africa are guided by fatality thresholds, which aim to mitigate population-level impacts. These thresholds are set below the rate at which populations could decline due to anthropogenic pressures (MacEwan et al. 2018). For this project, thresholds have been established, and similar measures should be applied to all future wind energy developments. In theory, if each development implements thresholds and appropriate mitigation measures when exceedances occur, the EAAA1 and EAAA2 VEC populations should not decline due to wind energy impacts.

The mitigation measures proposed in this report (buffering key habitats used by bats, use of appropriate lighting technology, blade feathering, and using smart curtailment and/or acoustic deterrents) should be applied to all future projects so that there is a collective management responsibility (IFC 2013).

7 ENVIRONMENTAL MANAGEMENT PROGRAMME

Objective: Avoid and minimize modification of bat habitats

Project component/s	All project infrastructure
Potential Impact	Vegetation clearing for project infrastructure, as well as noise, dust and pollution generated during construction activities, will impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement. Construction of WEF infrastructure could result in destruction and/or disturbance to bat roosts and inadvertently provide new roosting spaces for some bat species in risky locations.
Activity/risk source	All construction activities and associated activities (e.g., driving)
Mitigation: Target/Objective	1. Avoid potential for bats to roost in project infrastructure (e.g., buildings, and turbines) 2. Minimize disturbance to bats 3. Minimize habitat loss 4. Minimize displacement of bats

Mitigation	**Responsibility**	**Timeframe**
1. Ensure all project infrastructure (e.g., buildings, and turbines) is properly sealed such that bats cannot gain access. 2. No construction activities at night, apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste). 3. No placement of infrastructure (except roads and OHL) within No-Go areas. 4. Minimize clearing of native vegetation, minimize disturbance and destruction of farm buildings on site, minimize removal of native trees. Rehabilitate and enhance all areas disturbed during construction, (including aquatic habitat). 5. Reduce turbine noise emissions by serration of the back edges of the blade, by using a low-noise blade airfoil design or using blade trailing-edge brushes.	Project Developer Contractor	During design and planning phase and throughout construction phase

Performance Indicator	No bat roosts are destroyed No bats colonise new project infrastructure for roosting No infrastructure in No-Go areas (except roads and OHL) All areas disturbed during construction are rehabilitated
Monitoring	An appointed ECO must inspect all new project infrastructure, in conjunction with or via training from a bat ecologist, to ensure bats cannot gain access. ECO to ensure compliance with good construction abatement control practices. ECO must ensure no infrastructure is placed in No-Go areas (see Figure 3). If a bat roost is encountered during construction, the ECO must consult a bat ecologist to determine appropriate actions. ECO to ensure all disturbed areas are rehabilitated. ECO to ensure turbine blades have appropriate noise-reduction technology.

Objective: Avoid and minimize bat fatality	
Project component/s	Wind turbines
Potential Impact	Bat mortality through collisions with wind turbine blades.
Activity/risk source	Operating Wind Turbines
Mitigation: Target/Objective	1. Avoid bat fatalities through turbine layout design and turbine dimensions 2. Minimize bat fatalities using smart curtailment or deterrents during operation

Mitigation	Responsibility	Timeframe
1. No placement of turbines in No-Go Areas (Figure 3). 2. Maintain a minimum blade sweep of 30 m to avoid impacts to lower flying bats such as clutter-edge species (e.g., Cape serotine, Natal long-fingered bat). 3. Minimize the rotor diameter 4. Feather blades to prevent free-wheeling below the turbine cut-in speed 5. Implement fatality monitoring throughout the operational phase 6. Apply smart curtailment or deterrents if fatality thresholds are exceeded. Annual fatality threshold per Least Concern species = 16 individuals. Annual fatality threshold per Species of Special Concern = 1 individual for each of [African Straw-coloured fruit bat, Wahlberg's Epauletted fruit bat, Percival's Short-eared Trident bat, Blasius's Horseshoe bat, Egyptian Rousette and Lessor Long-fingered bat].	Project Developer Operator	BMP developed prior to operation. BMP active throughout operation phase.

Performance Indicator	≤ 16 individuals per Least Concern species killed annually ≤ 1 individual per Species of Special Concern killed annually
Monitoring	ECO must ensure no turbines are placed in No-Go areas, including the blade tips (Figure 3). ECO must ensure the dimensions of the final selected turbine adhere to requirements (A minimum blade sweep of 30 m). A Biodiversity Management Plan (BMP) for bats must be developed which includes the design of a post-construction fatality monitoring program (PCFM) for bats, and an adaptive management response plan that provides an escalating scale of mitigation should fatality thresholds be exceeded. ECO to ensure adherence to BMP and any mitigation measures implemented

Objective: Reduce impact of light pollution	
Project component/s	All project infrastructure
Potential Impact	Construction of project infrastructure will increase ecological light pollution from artificial lighting associated with turbines, the substation and other operational and maintenance buildings. Light pollution can alter ecological dynamics (Horváth et al. 2009, Bará and C. Lima 2024). Lighting attracts and can cause direct mortality of insects, reducing the prey base for bats, especially bat species that are light-phobic. These species may also be displaced from previous foraging areas due to lighting. Other bat species forage around lights, attracted by higher numbers of insects. This may bring these species into the vicinity of the project and indirectly increase the risk of collision with wind turbines.
Activity/risk source	Light sources from project infrastructure
Mitigation: Target/Objective	1. Avoid light pollution 2. Minimize light pollution

Mitigation	Responsibility	Timeframe

1. No placement of infrastructure within No-Go areas (Figure 3). 2. Use motion-sensor lighting, avoid sky-glow by using hoods and downward facing lighting, increase spacing between lighting units, and use low pressure sodium lights	Project Developer Operator	During design and planning phase and throughout operation phase.

Performance Indicator	Limited attraction of insects to light sources Limited foraging of bats around light sources Limited mortality at insects at light sources
Monitoring	ECO must ensure no infrastructure is in No-Go areas (Figure 3). ECO must ensure motion-sensor lighting is used. ECO must ensure all lighting fixtures have hoods and/or are downward facing, where appropriate, to prevent sky-glow. ECO must ensure minimum lighting is used and lighting is spaced to prevent excessive use of lighting. ECO must ensure low-pressure sodium lighting is used.

8 CONCLUSION

This EIA report assessed impacts to bats that could occur because of the construction, operation and decommission of the Emvelo WEF and grid connection. The assessment was based on 16 months of baseline data on bat activity recorded at the project. Based on these data, the key issue for the WEF will be managing collision impacts to Cape serotine and Egyptian free-tailed bat, and cumulative impacts.

The first mitigation measure proposed to manage risk is to adhere to the no-go buffers which aim to spatially avoid impacts by buffering key habitat features used by bats. This measure is likely to be effective for most bat species recorded at the project, but additional mitigation measures are needed to avoid impacts to free-tailed bats, which forage high in the air, and to reduce residual impacts.

Turbine design can be effective, and it is recommended to maintain a minimum blade sweep of at least 30 m. However, free-tailed bats will still collide with turbine blades above this height and as such, the rotor diameter must be limited as much as practicable to minimize the space where collisions might occur. Additionally, blade feathering must be implemented to limit the rotation of turbine blades below the turbine cut-in speed when electricity is not being generated.

Mitigation measures to minimize residual impacts after the application of the above measures include smart curtailment and acoustic deterrents. As such, the project should consider the cost and feasibility of these measures. The residual impacts must be monitored using post-construction fatality monitoring for a minimum of two years (Aronson et al. 2020). Smart curtailment and/or acoustic deterrents must be used if this monitoring indicates that species fatality thresholds have been exceeded (MacEwan et al. 2018) to maintain the impacts to bats within acceptable limits of change and prevent declines in the impacted bat populations.

The overall impact to bats was assessed as moderate after the application of the mitigation measures proposed to avoid and minimize impacts to bats. However, on a species level, the project presents differential risk and impacts to bats must be managed adaptively during the operational phase, particularly for those species (e.g. Egyptian free-tailed bat and Cape serotine) for which high risk is predicted during some periods.

This adaptive management will be guided by the Environmental Management Programme for bats which must include the development of a Biodiversity Management Plan (BMP) to manage impacts to bats during

the operation of the facility. The BMP for bats must be developed by a bat ecologist before the commencement of operation and must include the post-construction fatality monitoring plan design, fatality thresholds calculations and rationale (updated as required), and an adaptive management response plan that provides a timeous action pathway for mitigation, including roles and responsibilities, should fatality thresholds be exceeded. Provided these measures are adhered to, the project assessed can be approved.

Experience

ADVISORY WORK

- **Scaling Wind Program (2021 - current); IFC; Ethiopia and Côte d'Ivoire**
  Technical review of a risk screening exercise to identify suitable locations for wind power projects.

- **Bash and Dzhankeldy Wind Power Projects (2021 – 2023); MIGA; Uzbekistan**
  Technical review of ESIA, Critical Habitat Assessments, Biodiversity Management Plan & Biodiversity Monitoring and Evaluation Programme, and Collision Risk Management Plan. Development of biodiversity ESAP's.

- **Zarafshan Wind Power Project (2021 – 2023); IFC; Uzbekistan**
  Technical Review of ESIA, Critical Habitat Assessments, Environmental Management plans, PCFM and Shutdown on Demand design. Development of biodiversity ESAP's.

- **Good Practices Handbook Post-Construction Monitoring of Bird and Bat Fatalities at Onshore Wind Energy Facilities (2020 - 2022); IFC**
  Served on the Stakeholder Advisory Committee, providing input, comments and guidance to support the development of this handbook.

- **Khizi and Abershon Windfarm Projects (2021); IFC; Azerbaijan**
  Technical review of IBAT summary reports and ESIA Scoping reports.

- **Kinangop Wind Park (2017); AIIM; Kenya**
  Review and design of mitigation strategies for managing impacts to bats.

SPECIALIST DECLARATION FORM – AUGUST 2023

Specialist Declaration form for assessments undertaken for application for authorisation in terms of the National Environmental Management Act, Act No. 107 of 1998, as amended and the Environmental Impact Assessment (EIA) Regulations, 2014, as amended (the Regulations)

REPORT TITLE
EMVELO WIND ENERGY FACILITY AND GRID CONNECTION MPUMALANGA, SOUTH AFRICA BAT (CHIROPTERA) SCOPING REPORT

Kindly note the following:

1. This form must always be used for assessment that are in support of applications that must be subjected to Basic Assessment or Scoping & Environmental Impact Reporting, where this Department is the Competent Authority.
2. This form is current as of August 2023. It is the responsibility of the Applicant / Environmental Assessment Practitioner (EAP) to ascertain whether subsequent versions of the form have been published or produced by the Competent Authority. The latest available Departmental templates are available at https://www.dffe.gov.za/documents/forms.
3. An electronic copy of the signed declaration form must be appended to all Draft and Final Reports submitted to the department for consideration.
4. The specialist must be aware of and comply with '*the Procedures for the assessment and minimum criteria for reporting on identified environmental themes in terms of sections 24(5)(a) and (h) and 44 of the act, when applying for environmental authorisation - GN 320/2020)'*, where applicable.

1. SPECIALIST INFORMATION

Title of Specialist Assessment	Bat Assessment
Specialist Company Name	Camissa Sustainability Consulting
Specialist Name	Jonathan Aronson
Specialist Identity Number	8408065066083
Specialist Qualifications:	MSc (Zoology), MSc (Environment and Resource Management)
Professional affiliation/registration:	SACNASP
Physical address:	Bos en Lommerweg 86-3 1055EC Amsterdam, The Netherlands
Postal address:	Bos en Lommerweg 86-3 1055EC Amsterdam, The Netherlands
Postal address	Bos en Lommerweg 86-3 1055EC Amsterdam, The Netherlands
Telephone	+31 72 7971247
Cell phone	+31 72 7971247
E-mail	Jbaronson1@gmail.com

2. DECLARATION BY THE SPECIALIST

I, Jonathan Aronson declare that –

- I act as the independent specialist in this application;
- I am aware of the procedures and requirements for the assessment and minimum criteria for reporting on identified environmental themes in terms of sections 24(5)(a) and (h) and 44 of the National Environmental Management Act (NEMA), 1998, as amended, when applying for environmental authorisation which were promulgated in Government Notice No. 320 of 20 March 2020 (i.e. "the Protocols") and in Government Notice No. 1150 of 30 October 2020.
- I will perform the work relating to the application in an objective manner, even if this results in views and findings that are not favourable to the applicant;
- I declare that there are no circumstances that may compromise my objectivity in performing such work;
- I have expertise in conducting the specialist report relevant to this application, including knowledge of the Act, Regulations and any guidelines that have relevance to the proposed activity;
- I will comply with the Act, Regulations and all other applicable legislation;
- I have no, and will not engage in, conflicting interests in the undertaking of the activity;
- I undertake to disclose to the applicant and the competent authority all material information in my possession that reasonably has or may have the potential of influencing –
    - any decision to be taken with respect to the application by the competent authority; and;
    - the objectivity of any report, plan or document to be prepared by myself for submission to the competent authority;
- All the particulars furnished by me in this form are true and correct; and
- I realise that a false declaration is an offence in terms of Regulation 48 and is punishable in terms of section 24F of the NEMA Act.

NATIONAL ENVIRONMENTAL MANAGEMENT ACT, 1998 (ACT NO. 107 OF 1998) AND ENVIRONMENTAL IMPACT REGULATIONS, 2014 (AS AMENDED) - REQUIREMENTS FOR SPECIALIST REPORTS (APPENDIX 6)

Regulation GNR 326 of 4 December 2014, as amended 7 April 2017, Appendix 6	**Section of Report**
1. (1) A specialist report prepared in terms of these Regulations must contain- a) details of- i. the specialist who prepared the report; and ii. the expertise of that specialist to compile a specialist report including a curriculum vitae;	Appendix 2
b) a declaration that the specialist is independent in a form as may be specified by the competent authority;	Appendix 3
c) an indication of the scope of, and the purpose for which, the report was prepared;	Section 1.1
(cA) an indication of the quality and age of base data used for the specialist report;	Section 4
(cB) a description of existing impacts on the site, cumulative impacts of the proposed development and levels of acceptable change;	Section 5.1, Section 6
d) the date and season of the site investigation and the relevance of the season to the outcome of the assessment;	Section 4
e) a description of the methodology adopted in preparing the report or carrying out the specialised process inclusive of equipment and modelling used;	Section 4
f) details of an assessment of the specific identified sensitivity of the site related to the proposed activity or activities and its associated structures and infrastructure, inclusive of a site plan identifying site alternatives;	Section 6
g) an identification of any areas to be avoided, including buffers;	Section 6, Figure 5
h) a map superimposing the activity including the associated structures and infrastructure on the environmental sensitivities of the site including areas to be avoided, including buffers;	Appendix 1 (Figure 3)
i) a description of any assumptions made and any uncertainties or gaps in knowledge;	Section 2
j) a description of the findings and potential implications of such findings on the impact of the proposed activity, (including identified alternatives on the environment) or activities;	Section 5
k) any mitigation measures for inclusion in the EMPr;	Section 6, Section 7

Regulation GNR 326 of 4 December 2014, as amended 7 April 2017, Appendix 6	**Section of Report**
l) any conditions for inclusion in the environmental authorisation;	Section 6, Section 7
m) any monitoring requirements for inclusion in the EMPr or environmental authorisation;	Section 6, Section 7
n) a reasoned opinion- i. (as to) whether the proposed activity, activities or portions thereof should be authorised; (iA) regarding the acceptability of the proposed activity or activities; and ii. if the opinion is that the proposed activity, activities or portions thereof should be authorised, any avoidance, management and mitigation measures that should be included in the EMPr, and where applicable, the closure plan;	Section 8
o) a description of any consultation process that was undertaken during the course of preparing the specialist report;	NA
p) a summary and copies of any comments received during any consultation process and where applicable all responses thereto; and	NA
q) any other information requested by the competent authority.	NA
2) Where a government notice *gazetted* by the Minister provides for any protocol or minimum information requirement to be applied to a specialist report, the requirements as indicated in such notice will apply.	Appendix 5: Site Sensitivity Verification Report

1 INTRODUCTION

Sheepmoor Wind Energy Facility (Pty) Ltd are proposing the development of a commercial wind energy project located near Ermelo, within the Msukaligwa Local Municipality and the Gert Sibande District Municipality, in the Mpumalanga Province. The project forms part of a development cluster that is expected to comprise two separate Wind Energy Facilities (WEFs).

This EIA report covers the Sheepmoor WEF which is proposed to comprise up to 25 turbines with a maximum output capacity of up to 260 MW. The WEF will have an anticipated lifespan of 25 – 30 years. In addition to the wind energy infrastructure, it is proposed that an on-site substation with a capacity up 132 kV and an up to 132 kV Overhead Powerline (OHPL) of approximately 30 km (300 m corridor) in distance, traversing eighteen (18) land parcels, be constructed to connect the proposed WEF to the proposed new Camden B substation. The proposed technical details of Sheepmoor WEF are presented below:

Developer / Applicant	Sheepmoor WEF
DFFE Reference	To be confirmed
WEF Generation Capacity	Up to 260 MW
Site Access	Locality to be confirmed. Total width up to 15 m (12 m after rehabilitation) consisting of up to 3m width for underground 33 kV reticulation.
Number of Turbines	Up to 23
Hub Height from ground level	Up to 150 m
Blade Length	Up to 110 m
Rotor Diameter	Up to 220 m
Length of internal roads	Unknown at this point.
Width of internal roads	Up to 12 m to be rehabilitated to up to 9 m.
On-site substation capacity	Up to 132 kV
Proximity to grid connection	Approximately 25 km
Grid Connection Capacity	Up to 132 kV
Temporary turbine construction laydown and storage areas.	Crane platforms and hardstand laydown area up to 40 ha (Up to 1 ha per turbine)
Permanent footprint area dimensions, including roads, turbine hardstand areas, O&M buildings and battery pad.	O&M: Up to 1 ha Hardstand areas: Up to 1 ha Total area of final footprint (including roads): up to 180 ha
Operations and maintenance buildings (O&M building) with parking area	Up to 1 ha
Height of fencing	2.8 m
Type of fencing	Where site offices are required, temporary screen fencing used to screen offices from the wider landscape.

1.1 Scope and Objectives

This EIA report presents a Bat (Chiroptera) Impact Assessment for the Sheepmoor WEF and associated grid connection. Collisions with wind turbine blades are a leading cause of bat mortality globally (Cryan, 2011; O'Shea et al., 2016). Given the nature, scale, and uncertainty of these impacts to bats, specialist studies are required to assess the risks of renewable energy infrastructure on bats (Rodrigues 2015, MacEwan et al. 2020b, SANBI 2020, Bennun et al. 2021).

The objectives of this assessment are to present the baseline ecological condition of the project site for bats, and to use these characterisations to predict and assess the potential impact of the project on bat species and their habitats as well as to provide actions to mitigate impacts if required.

2 ASSUMPTIONS AND LIMITATIONS

The core techniques used to assess bat activity in this study are acoustic monitoring and roost surveys, both of which have several limitations which will influence the findings and recommendations of this study.

Acoustic monitoring allows for rapid, passive collection of a large volume of bat activity data which can help identify the bat species present within a particular location and their associated spatio-temporal relative activity patterns. In the context of wind farms, acoustic monitoring is therefore a useful technique however, there are several constraints that must be acknowledged. These are discussed in detail by Voigt et al. (2021), Adams et al. (2012), and Kunz et al. (2007a) and fundamentally, include that acoustic monitoring cannot provide an indication of bat abundance or population size at a site. In addition, population demographics such as age and sex of bats cannot generally be determined from echolocation calls. Due to the large volume of data collected by bat detectors it is impractical and prohibitively time-consuming to inspect each file for echolocation calls and to identify the associated bat species. Specialised statistical software uses bat call reference libraries to automate the identification process but developing such libraries is challenging given the variation individual species display in their echolocation call structure and overlap between species. This study used the Wildlife Acoustics library "Bats of South Africa Version 5.4.2", but this excludes reference calls for most South African species thus these may have been overlooked. However, given the duration of the monitoring and spatial coverage of the detectors, the acoustic data provides a reasonable inventory of the species present, and a good indication of the relative magnitude of bat activity. Lastly, bat activity is notably variable in response to a number of factors such as land use change, climactic variability, variations in prey abundance and meteorological conditions which can vary over different time scales. Since this study is limited to 12 months, the baseline conditions presented here may not be representative of activity over longer time frames meaning risk may be misinterpreted.

The major limitation with roost surveys is finding roosting bats. Bats use a diversity of roosting sites including trees, buildings, crevices, and underground sites (caves and mines). The presence of these features at a site can help to target roost searches but evidence of bats may not always be apparent even if bats are present. Importantly, the absence of bat evidence in these situations does not equate to evidence of bat absence (Collins 2006). Thus, this study uses a precautionary approach and will apply buffers to roosts (largely buildings and rocky crevices) even if bats were not located given their potential role in supporting roosting bats.

It is difficult to assess the risk to bats during operation of the proposed facility based on acoustic data collected during pre-construction surveys. For example, Hein et al. (2013) showed that pre-construction bat activity was not a significant indicator of collision risk. Lintott et al. (2016) argued that environmental impact assessments do not predict the risks to bats accurately. This may partly be because it is hypothesized that bats may be attracted to wind turbines (Cryan and Barclay 2009, Guest et al. 2022) which some evidence suggests may be the case (Horn et al. 2008, Richardson et al. 2021). While this report makes predications about the potential risk to bats posed by the project, these carry a degree of uncertainty and must be verified by using post-construction surveys to ensure that the predictions are accurate and bat behaviour has not altered from pre-construction levels (Lintott et al. 2016).

Risk to bats was determined based on median bat activity per night derived from the bat activity dataset collected with acoustic monitoring. Median values were compared to those in Table 5 in MacEwan et al. (2020b) which provides height-specific fatality risk categories (high, medium, low) based on bat activity sampled in different South African terrestrial ecoregions. The Project Area of Influence (PAOI) is situated in the Highveld Grasslands ecoregion (Dinerstein et al. 2019) however reference values are not available for this ecoregion in MacEwan et al. (2020b). Instead, median values were compared to reference values for the Drakensberg Grasslands, Woodlands and Forest ecoregion. While bat activity levels differ between these two ecoregions this difference is small (MacEwan et al. 2020a). The lack of a direct reference for the Highveld Grasslands ecoregion is therefore not a major limitation and the comparison is suitable to provide an evaluation of risk.

3 LEGAL REQUIREMENTS AND GUIDELINES

The EIA processes for this project is being undertaken in terms of Government Notice (GN) No. R. 983 of 4 December 2014 (as amended to GNR 327), promulgated under the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA) EIA Regulations, 2014 (as amended). In addition, there are various international, regional, and local legislation, policies, regulations, guidelines, conventions, and treaties in place for the protection of biodiversity, under which bats would also be protected or considered. These create a policy environment and impact management framework aiming to prevent excessive impacts to biodiversity and which was used to assess risk of this specific project. Specific policies include the following:

- Convention on Biological Diversity Post-2020 Global Biodiversity Framework
- United Nations Sustainable Development Goals
- Convention on the Conservation of Migratory Species of Wild Animals (1979)
- Convention on Biological Diversity (1993)
- Constitution of the Republic of South Africa, 1996 (Act No. 108 of 1996)
- National Environmental Management Act, 1998 (NEMA, Act No. 107 of 1998)
- National Environmental Management: Biodiversity Act, 2004 (Act No. 10 of 2004)
- Northern Cape Nature Conservation Act (Act 9 of 2009)
- The Equator Principles (2013)
- International Finance Corporation Performance Standards (PS6)
- The Red List of Mammals of South Africa, Swaziland, and Lesotho (2016)
- South Africa National Biodiversity Strategy and Action Plan (2005)
- Guidelines for the implementation of the Terrestrial Flora (3c) & Terrestrial Fauna (3d) Species Protocols for environmental impact assessments in South Africa
- Mitigating biodiversity impacts associated with solar and wind energy development. IUCN Guidelines for project developers (2021)
- South African Good Practise Guidelines for Surveying Bats in Wind Energy Facility Developments – Pre-Construction (2020)
- South African Good Practise Guidelines for Operational Monitoring for Bats at Wind Energy Facilities (2020)
- South African Bat Fatality Threshold Guidelines (2018)
- Mitigation Guidance for Bats at Operational Wind Energy Facilities in South Africa (2018)

4 SURVEY METHODOLOGY

The Project Area of Influence (PAOI) was defined as the Area of Interest (AoI) of the development cluster plus a 10 km buffer given that bats are flying mammals (Scottish Natural Heritage 2019). This area was studied at a desktop level to determine which bat species (i.e., impact receptors) are likely to occur within the PAOI, to provide information on their natural history and conservation status, and to contextualise the project site within the larger social-ecological environment with respect to bats.

Bats were also studied through 12 months of acoustic monitoring in the AoI which began on 26 April 2022 and ended on 4 July 2023. After this, monitoring continued at one met mast location until 11 November 2023. Bat activity was sampled at 11 locations (Figure 1, Table 1) within the AoI with Wildlife Acoustics, Inc. SM4 bat detectors. At nine locations (AM4 – AM12), SMM-U2 microphones were positioned at the top of a 10 m aluminium mast. At the remaining two locations (AM1 and AM3), microphones were positioned on meteorological towers at 10 m, 50 m, and 90 mrespectively. Equipment at AM12 was stolen and therefore data from this location were not available to be assessed in this report.

The bat detectors were programmed to record activity nightly, from 30 minutes before sunset to 30 minutes after sunrise, and this report summarises 518 nights of bat activity data. This monitoring period therefore spans of all four seasons providing a representative account of temporal bat activity patterns across a year. Acoustic data retrieved from each bat detector were processed using Kaleidoscope® Pro (Version 5.4.2, Wildlife Acoustics, Inc.). Bats were automatically identified using the embedded "Bats of South Africa Version 5.4.0" reference library and verified by inspecting echolocation files. The number of acoustic files recorded was used as a measure to quantify bat activity, whereby each file was considered one bat pass of themicrophone.

Roost surveys were undertaken which entailed discussions with landowners to locate any known roosts or potential roosts with evidence of bats. In addition, buildings at farmsteads within the PAOI, as well as accessible rocky outcrops/crevices, were systematically surveyed during field visits in November 2022 (spring), and January 2023 (summer). The surveys aimed to directly observe roosting bats, locate evidence of roosting bats (e.g., culled insect remains, fur-oil-stained exit and entry points, guano/droppings), and assess the likelihood for each potential roost to support bats.

Table 1: Summary of the Bat Acoustic Monitoring Sampling Locations and Effort

Bat Detector	Coordinates	# Sample Nights	Altitude (m)	Habitat Features
AM1 (Met mast)	-26.612298°S 30.317572°E	10m: 518 50 m: 226 90 m: 478	1,778	In Wakkerstroom Montane Grassland, 400 m west of small escarpment, 560 m north of farm dam, 440 m west of woodland patch, 560 m northeast of wetland
AM3 (Met Mast)	-26.587572°S 30.284137°E	10 m: 340 50 m: 435 90 m: 326	1,748	In Wakkerstroom Montane Grassland, 420 m west of farmstead, 420 m east of stream and seep wetland
AM4	-26.665933°S 30.321221°E	208	1,550	In Eastern Highveld Grassland, 360 m west of cultivated area, 230 m southeast of woodland, 240 m north east of stream, 430 m south east of depression wetland
AM5	-26.611025°S 30.363393°E	377	1,515	In Eastern Highveld Grassland, on border of cultivated areas and disturbed grassland, 470 m southeast of stream, wetland and woodland patch, 2.4 km northwest of farmstead
AM6	-26.562101°S 30.296970°E	242	1,732	In Wakkerstroom Montane Grassland, at edge of woodland patch, 80 m east of depression wetland, 255 m west of stream
AM7	-26.640015°S 30.306442°E	194	1,655	Within wooded valley, 60 m west of stream, 300 m east of seep wetland
AM8	-26.621551°S 30.277550°E	137	1,735	In Wakkerstroom Montane Grassland, 680 m west of woodland patch,167 m north of seep wetland
AM9	-26.549013°S 30.315353°E	51	1,667	In Eastern Highveld Grassland adjacent to wetland and surrounded by trees
AM10	-26.592367° S 30.336850°E	163	1,696	In Wakkerstroom Montane Grassland, above small escarpment in shallow wooded valley
AM11	-26.632172°S 30.265925°E	163	1,694	In Eastern Highveld Grassland adjacent to tree edge line, 220 m south east of wetland, installed at farmstead

5 SPECIALIST FINDINGS

5.1 Ecological Baseline

The Project Area of Influence (PAOI) is situated in the Grassland Biome and comprises predominantly Eastern Highveld Grassland vegetation (Figure 1). The landscape associated with this vegetation consists of slight to moderately undulating plains with small scattered rocky outcrops. The vegetation is short, dense grassland (Mucina and Rutherford 2006). Wakkerstroom Montane Grassland occurs in the middle of the PAOI, on low mountains and undulating plains. Here the vegetation comprises short montane grassland on plateaus and flat areas. On steep, east facing slopes and in drainage areas, short forest and thicket occurs. Both vegetation types are endemic, and Eastern Highveld Grassland is classified as Vulnerable while Wakkerstroom Montane Grassland is classified as Least Concern (SANBI 2018). The PAOI includes some low hills and wetland depressions and has largely been transformed by cultivation in the west, commercial forestry in the east and urban sprawl, including extensive areas of alien invasive trees. The PAOI is in a summer rainfall region and has a cool-temperate climate with dry winters, frequent occurrence of frost and large differences in both diurnal and seasonal temperature extremes (Mucina and Rutherford 2006).

Critical Biodiversity Areas (CBA), areas of high biodiversity value that must be maintained in a natural state, are located throughout the PAOI, classified as either “CBA Irreplaceable” and “CBA Optimal” (Figure 1). The former category comprises 1) areas required to meet conservation targets and those with irreplaceability values greater than 80 %, 2) areas which represent critical linkages or pinch-points in the landscape that must remain natural, and 3) Critically Endangered ecosystems (MTPA 2014). The latter category comprises areas that are not ‘irreplaceable’, but they are the most optimal land configuration to meet all biodiversity targets. Ecological Support Areas (ESA), not essential for meeting biodiversity targets but important in supporting the functioning of CBAs and delivering important ecosystem services, are also located throughout the PAOI.

Parts of the PAOI fall within a National Protected Areas Expansion Strategy (NPAES) Focus area (Moist Escarpment Grasslands), targeted for protected area expansion for improved ecosystem representation, ecological sustainability and resilience to climate change. Chrissiesmeer Protected Environment and Jericho Dam Nature Reserve overlap the north and east of the PAOI respectively (Figure 1).

Bat roosting sites in the PAOI are relatively limited and unlikely to support large congregations of bats, with no underground sites (e.g., caves, mines, sinkholes) known to be present. The closest known major bat roost is approximately 70 km north of the PAOI. Although occasional ridges and rocky outcrops are features of the landscape (Mucina and Rutherford 2006) these are not extensive. Some bat species could roost in these features. Bats are likely to roost in buildings associated with farmsteads within and bordering the AoI especially Cape Serotine and Egyptian Free-tailed Bat (Monadjem et al. 2020). Trees growing at these farmsteads and elsewhere on site where they form clumps, could also provide roosting spaces for bats, even though most are alien invasive species. Completed surveys of some buildings in the of the PAOI did not reveal the presence of roosting bats and as such were assessed as being of low relative suitability. However, these could be used by bats as night-roosts (locations used by bats to feed on captured prey, or to rest between foraging bouts) and should therefore still be considered, and avoided where possible, in the spatial planning.

Sensitive features in the PAOI at which bat foraging activity may be concentrated include farm buildings where they would forage for insects attracted to lighting (Rydell 1992, Jung and Kalko 2010), dams and wetland areas (Sirami et al. 2013), within and along the edge of woodland/tree patches, and over cultivated areas (Bohmann et al. 2011, Noer et al. 2012). Free-tailed bats (Molossidae) will fly at high altitudes, and their foraging habitat is essentially all airspaces (McCracken et al. 2008, Nguyen et al. 2019).

Based on current taxonomic information and bat occurrence data, 23 species could occur within the PAOI (Table 2). The majority have a low likelihood of occurrence however the potential suite of species includes 10 high risk species, including fruit bats (Pteropodiae) and free-tailed bats (Molossidae) which are vulnerable to wind energy impacts in South Africa (MacEwan 2016, Aronson 2022).

Table 2: Bat Species Potentially Occurring within the PAOI

Common Name Species Name	Key Habitat Requirements*	Prob. Of Occurrence	Conservation Status		Wind Energy Risk[δ]
			IUCN[†]	RSA[!]	
Natal Long-fingered bat *Miniopterus natalensis*	Temperate or subtropical species. Primarily in savannahs and grasslands. Roosts in caves, mines, and road culverts. Clutter- edge forager. Migratory.	**Confirmed (5,018 passes)**	LC/U	LC	**High**
Lessor Long-fingered bat *Miniopterus fraterculus*	Temperate species, associated with grasslands. Cave-dependant but also roosts in tunnels and mines. Habitat includes savannah bushveld, moister mistbelt and coastal forest habitats. Clutter-edge forager. Migratory.	Moderate	LC/U	LC	**High**
Cape Serotine *Laephotis capensis*	Arid semi-desert, montane grassland, forests, savannah and shrubland. Roosts in vegetation and human-made structures. Clutter-edge forager.	**Confirmed (50,243 passes)**	LC/S	LC	**High**
Mauritian tomb bat *Taphozous mauritianus*	Savannah woodland preferring open habitat. Roosts on rock faces, the outer bark of trees or on the outer walls of buildings under the eaves of roofs. Forages in urban areas and over cultivation. Open- air forager.	High	LC/U	LC	**High**
Little Free-tailed bat *Mops pumilus*	Semi-arid savannah, forested regions, woodland habitats. Roosts in narrow cracks in rock and trees but also in buildings. Open-air forager. Forages in urban areas and over cultivation.	**Confirmed (1,767 passes)**	LC/U	LC	**High**
Midas Free-tailed bat *Mops midas*	Hot low-lying savannah and woodland. Roosts in narrow cracks in rock and trees but also in buildings. Open-air forager.	Low	LC/D	LC	**High**
Egyptian Free-tailed bat *Tadarida aegyptiaca*	Desert, semi-arid scrub, savannah, grassland, and agricultural land. Roosts in rocky crevices, caves, vegetation, and human-made structures. Open-air forager.	**Confirmed (20,995 passes)**	LC/U	LC	**High**
Wahlberg's Epauletted fruit bat *Epomophorus wahlbergi*	Roost in dense foliage of large, leafy trees. Associated with forest and forest-edge habitats but will forage in urban environments.	Low	LC/S	LC	**High**
African Straw-coloured fruit bat *Eidolon helvum*	Non-breeding migrant in the PAOI.	Low	NT/D	LC	**High**
Egyptian Rousette *Rousettus aegyptiacus*	Distribution influenced by availability of suitable caves roosts.	Low	LC/S	LC	**High**
Temminck's Myotis *Myotis tricolor*	Montane forests, rainforests, coastal forests, savannah woodlands, arid thicket, and fynbos. Roosts communally in caves (and mines) and closely associated with mountainous terrain. Migratory. Clutter-edge forager.	Low	LC/U	LC	**Medium-High**
Welwitsch's Myotis *Myotis welwitschii*	Mainly open woodland and savannah but also high-altitude grassland, tropical dry forest, montane tropical moist forest, savannah and shrublands. Clutter-edge forager.	Low	LC/U	LC	**Medium-High**
Yellow-bellied house bat *Scotophilus dinganii*	Occurs throughout the Savannah Biome but avoids open habitats such as grasslands and Karoo scrub. Roosts in hollow trees and buildings. Clutter-edge forager.	**Confirmed (169 passes)**	LC/U	LC	**Medium-High**
Dusky Pipistrelle *Pipistrellus hesperidus*	Woody habitats, such as riparian vegetation and forest patches. Recorded roosting in narrow cracks in rocks and under the loose bark of dead trees. Clutter-edge forager.	Low	LC/U	LC	**Medium-High**
Rusty Pipistrelle *Pipistrellus rusticus*	Savannah woodland and associated with open water bodies. Roosts in trees and old buildings. Clutter-edge forager.	Low	LC/U	LC	**Medium-High**
Long-tailed Serotine *Eptesicus hottentotus*	Montane grasslands, marshland and well- wooded riverbanks, mountainous terrain near water. Roosts in caves, mines, and rocky crevices. Clutter-edge forager.	**Confirmed (368 passes)**	LC/U	LC	**Medium**
Egyptian Slit-faced bat *Nycteris thebaica*	Savannah, desert, arid rocky areas, and riparian strips. Gregarious and roosts in caves but also in mine adits, Aardvark holes, rock crevices, road	Medium	LC/U	LC	**Low**

	culverts, roofs, and hollow trees. Clutter forager.				
Geoffroy's Horseshoe bat *Rhinolophus clivosus*	Savannah woodland, shrubland, dry, riparian forest, open grasslands, and semi- desert. Roosts in caves, rock crevices, disused mines, hollow baobabs, and buildings. Clutter forager.	Medium	LC/U	LC	**Low**
Bushveld Horseshoe bat *Rhinolophus simulator*	Occurs in caves within areas of moist savannah, adjacent to rivers and savannah woodland, montane habitats, and coastal mosaics. Commonly associated with riparian forest and along wooded drainage lines. Roosts in caves and mines. Clutter forager.	Medium	LC/D	LC	**Low**
Blasius's Horseshoe bat *Rhinolophus blasii*	Savannah woodlands and are dependent on the availability of daylight roosting sites such as caves, mines, or boulder piles.Clutter forager.	Low	LC/D	NT	**Low**
Darling's Horseshoe bat *Rhinolophus darlingi*	Mesic woodland savannahs. Roosts in caves, boulder piles, mines, culverts, large hollow trees and disused buildings. Clutter forager.	Low	LC/U	LC	**Low**
Sundevall's Leaf-nosed bat *Hipposideros caffer*	Savannah, bushveld and/or coastal forests, near to rivers and other water sources. Roosts in caves, sinkholes, rock fissures, hollow trees, mines, and culverts. Clutter forager.	Low	LC/D	LC	**Low**
Percival's Short-eared Trident bat *Cloeotis percivali*	Savannah and woodland areas. Roosts in caves and mine tunnels. Clutter forager.	Low	LC/U	EN	**Low**

5.2 Pre-Construction Bat Monitoring Results

Six bat species were confirmed to occur in the PAOI (Table 2) including four species classified as high risk from wind energy development: Natal Long-fingered bat, Cape Serotine, Little Free-tailed bat, and Egyptian Free-tailed bat. All of these species have a conservation status of Least Concern (both globally and regionally) and no red data species with a higher conservation status were detected. Although these species are currently classified as Least Concern, Rodhouse et al. (2019), Davy et al. (2020) and Frick et al. (2017) have all shown that in North America, Least Concern bats may be experiencing impacts due to wind farms that could result in changes to their conservation status. The global population trend is unknown for Natal Long-fingered bat, Little Free-tailed bat, and Egyptian Free-tailed bat but stable for Cape serotine. Given the unknown population trends for some of these species and the evidence of impacts from wind farms, ongoing monitoring and adaptive management will be essential to ensure their conservation status does not deteriorate.

A total of 80,051[1] bat passes were recorded over 518 sample nights. Most activity was attributed to Cape serotine (63 %) and Egyptian free-tailed bat (27 %). These species comprise the majority of bat fatalities at South African wind farms (Aronson 2022). Natal long-fingered bat accounted for 6 % of total activity. The remaining three species (Little free-tailed bat, Long-tailed serotine and Yellow-bellied house bat) were seldomly recorded and the magnitude of their activity suggests they would be at low risk of impacts. As such, the remainder of this section focuses on impacts to Egyptian free-tailed bat, Cape serotine and Natal long-fingered bat.

Based on MacEwan et al. (2020b), Cape serotine activity was predominantly low but high activity was recorded at AM5, AM8, AM9 and AM11, in summer and autumn (Table 3). The latter two monitoring stations were located at a farm dam and at a farmstead respectively indicating higher activity in relation to these landscape features. This species was also recorded at 50 m and 90 m but the magnitude of its activity was mostly low except for at AM3-50 during March and April when its activity suggests medium risk. Based on the dataset, this species is largely predicted to be at low collision risk. However, bats in the same family (Vespertilionidae) are known to be attracted to wind turbines in the United Kingdom (Richardson et al. 2021). Thus, although the data suggest a low collision risk, the installation of wind turbines in the landscape can alter bat activity patterns. Collision risk for this species will also depend on how close turbine blades reach the ground, with risk increasing the closer the blades reach the ground (Garvin et al. 2024).

[1] Exclusive of an additional 1,491 bat passes unable to be identified to a species.

Table 3: Median number of bat passes per hour per night for Cape serotine and associated risk based on MacEwan et al. (2020b).

The timeseries data indicate a clear seasonal pattern in bat activity for the Cape serotine (Table 4), with the mean number of bat passes per hour peaking significantly during summer, reaching up to 13.66 passes per hour. This is largely driven by activity at AM11 and AM9. This heightened activity in summer likely reflects optimal weather conditions and increased prey availability. In autumn, bat activity remains relatively moderate, with values between 0.02 and 3.48 passes per hour, suggesting continued but reduced presence compared to summer. In contrast, winter and spring exhibit notably lower levels of activity, with mean passes per hour not exceeding 1.17 in spring and 0.68 in winter. This seasonal trend suggests that Cape serotine bats are minimally active during colder months, likely due to reduced foraging opportunities or temperature constraints. Additionally, within each season, there is a gradual decrease in bat passes across a night. Peak activity in summer and spring is between 19:00 and 21:00, in autumn between 18:00 and 20:00, and in winter between 17:00 and 19:00.

The data showed that at 50 m and 90 m, moderate collision risk is predicted for Egyptian free-tailed bat apart from during autumn and spring when high risk is predicted (Table 5). High risk is predicted near AM11 in autumn, and AM4 and AM5 during spring. Egyptian free-tailed bat is flexible in its foraging strategy, and

it is thought that the habitat below has little influence on this species (Monadjem et al. 2020). These bats are open-air foragers based on their morphology and echolocation (Norberg and Rayner 1987) which means they tends to forage high in the air.

Table 5: Median number of bat passes per hour per night for Egyptian free-tailed bat and associated risk based on MacEwan et al. (2020b).

In spring, Egyptian free-tailed bat shows the highest activity levels overall, with peak passes per hour occurring around midnight (00:00 – 01:00) at 1.4 passes per hour (Table 6). This elevated activity during spring nights aligns somewhat with the Cape serotine data, where spring showed moderate activity; however, for the Egyptian free-tailed bat, spring is a clear peak season. In summer, activity for the Egyptian free-tailed bat is relatively lower compared to spring, with values not exceeding 0.57 passes per hour and generally concentrated in the earlier hours of the night. This is a notable contrast to Cape serotine, which displayed its highest seasonal activity in summer. This suggests that while the Cape serotine is more active during summer, the Egyptian free-tailed bat is less active during this period, potentially indicating differing ecological preferences or behavioural patterns. Autumn displays a moderate level of activity for the

Egyptian free-tailed bat, with values peaking around 20:00 – 21:00 at 0.78 passes per hour and then gradually decreasing through the night. This pattern is consistent with the Cape serotine, where autumn also showed moderate activity. In winter, the Egyptian free-tailed bat shows low activity levels across all hours, with peak activity reaching only 0.36 passes per hour early in the evening (18:00–19:00) and decreasing to nearly zero later at night. This aligns with the winter results for the Cape serotine bat, confirming that winter is a low-activity season for both species.

Table 7: Median number of bat passes per hour per night for Natal long-fingered bat and associated risk based on MacEwan et al. (2020b).

Activity of Natal long-fingered bat was predominantly low but high activity was recorded during spring at AM1 and AM9. Medium activity was also recorded during spring at AM5 and AM11 (Table 7). As such, overall impacts to this species are anticipated to be low, especially since activity levels at 50 m and 90 m were assessed as low based on criteria in MacEwan et al (2020b). However, this species may experience high cumulative impacts (see Section 6.3).

06:00 – 07:00	0.00	0.00	0.00	0.00

The timeseries data showed that this species exhibits relatively low and stable activity levels across all seasons, with a modest peak in autumn, where its activity reaches a maximum of 0.69 bat passes per hour between 21:00 and 22:00. This peak, though limited, suggests a slight preference for early evening hours in the autumn months. Throughout spring, summer, and winter, however, the Natal long-fingered bat maintains very low activity, rarely exceeding 0.35 passes per hour at any given time. The hourly distribution shows that this species activity slightly tapers off in the late evening and early morning hours, with a marked decline around midnight. This pattern suggests that the Natal long-fingered bat may have brief foraging periods early in the night, possibly returning to roost sites earlier than other nocturnal species. This species is migratory, and although difficult to show, the peak in activity in autumn could be suggestive of some bats (e.g. females) moving through the site to roosting sites north elsewhere in Mpumalanga or Limpopo after mating.

6 IDENTIFICATION AND ASSESSMENT OF IMPACTS

Impacts to bats that are likely to occur because of the construction, operation and decommissioning of the wind energy facility and grid connection are identified and assessed in the following section. The unit of analysis against which impacts were assessed is the local bat community and their associated habitats within the PAOI. Impacts considered for assessment include habitat modification and disturbance, displacement, fatality due to collisions with wind turbine blades, and light pollution since these are the major impacts likely to be associated with the project (Kunz et al. 2007b, Cryan and Barclay 2009, Bará and C. Lima 2024, Voigt et al. 2024). For each impact, the respective mitigation measures were categorised into those aimed at first avoiding impacts, then minimising impacts, and finally restoring areas impacted (Figure 2).

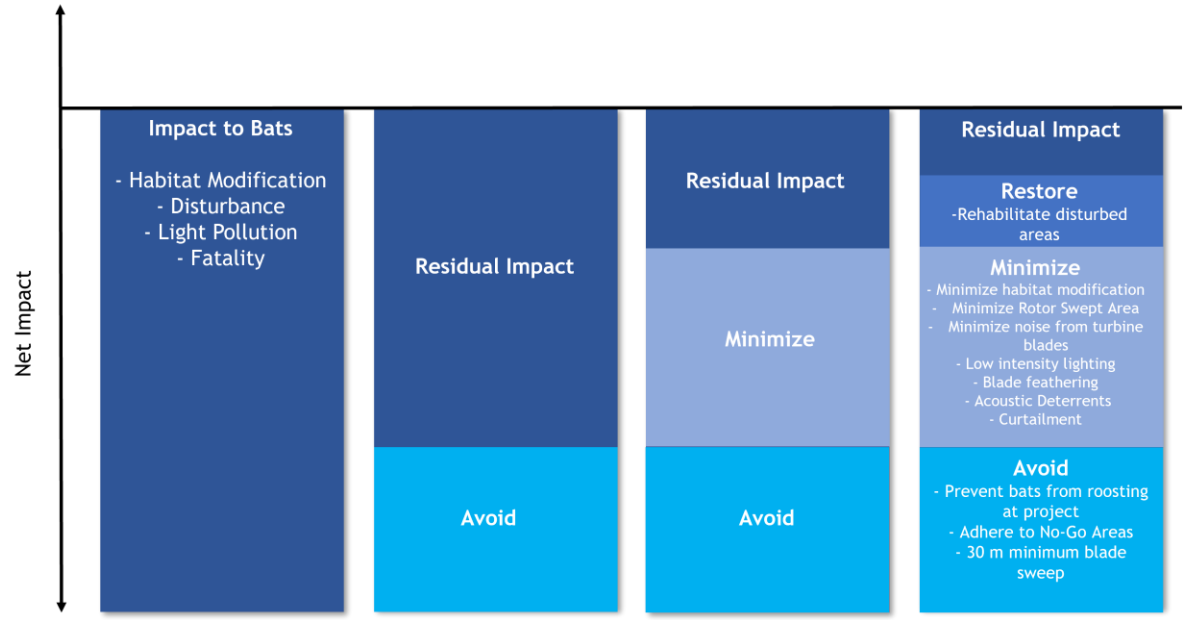

Figure 2: Mitigation Hierarchy applied to the Project with Mitigation Measures.

6.1 Wind Energy Facility

6.1.1 Construction Phase

IMPACTS

Removal of native vegetation, noise and dust generated during construction activities, and the presence of new infrastructure in the landscape, will negatively and indirectly impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement (Kunz et al. 2007b, Millon et al. 2015, Millon et al. 2018, Bennun et al. 2021, Leroux et al. 2022, Tolvanen et al. 2023).

Construction of WEF infrastructure could result in destruction (direct impact) of bat roosts (rocky crevices, buildings) and disturbance (indirect impact) of bat roosts potentially resulting in roost abandonment. Bat mortality can occur if roosts which contain bats are destroyed. Installation of new infrastructure in the landscape (e.g., buildings, turbines, road culverts) can provide new roosting spaces for some bat species, attracting them to areas with wind turbines and potentially increasing the likelihood of collisions.

Mitigation (Avoid)

Habitat modification impacts can be avoided by buffering habitat and landscape features (Table 8) that bats use to spatially limit the potential for bats to interact with project infrastructure, and to avoid impacting key bat habitat (Barré et al. 2018, Leroux et al. 2022). All key habitat features were buffered by 200 m as per best practise (Rodrigues 2015, MacEwan et al. 2020b).

To align with regional conservation and integrated development planning, the Mpumalanga Biodiversity Sector Plan Handbook (MTPA 2014) was consulted to guide spatial risk in the AoI. The intention was to align biodiversity conservation policy objectives with renewable energy policy objectives, attempting to minimize trade-offs between conflicting goals (Jackson 2011, Gasparatos et al. 2017). The handbook includes a map of terrestrial areas that are important for conserving biodiversity and ecological processes – Critical Biodiversity Areas (CBAs) and Ecological Support Areas (ESAs) respectively.

CBA Irreplaceable Areas were categorised as No-Go (Table 8) because the conservation goals for these areas are to maintain them in a natural state with no loss of ecosystems, functionality or species, and with no flexibility in land-use options (MTPA 2014). CBA optimal and areas with Highveld grassland were classified as high risk. Although the primary objective of the CBA optimal areas is to maintain these spaces in a natural state with no loss of ecosystems, functionality or species, some flexibility in land-use options is permitted (MTPA 2014), therefore these areas must be avoid as much as possible. The remaining areas were assigned low or medium risk where all infrastructure development should be prioritized. These included modified land, areas with invasive alien trees (plantations), ESA, and other Natural Areas (Table 8). Similarly, in ecological supports areas (ESAs), the objective is to maintain habitats in a natural, or near-natural, state with limited loss of ecosystems or functionality. Hence, these areas were classified as medium risk, permitting the siting of turbines in these spaces.

All turbines will be subjected to a post-construction bat fatality monitoring program which will monitor residual impacts at turbines located in CBA optimal and ecological support areas, as well as turbines in low-risk areas. The results of this monitoring will inform management actions where needed to ensure alignment with the MTPA objectives to limit impacts to biodiversity.

Table 8: Features used to assign spatial risk categories in the AoI for bats (Chiroptera)

Risk Level			
Low	**Medium**	**High**	**No-Go**
Heavily modified land	NPAES	CBA Optimal	CBA Irreplaceable Areas
Moderately modified land	ESA Landscape corridor	Highveld Grassland	Minor Watercourses (50 m buffer)
Cleared Invaded	ESA Local corridor		Farm Dams (200 m buffer)
Transformed	Other Natural Areas		Pan depressions (200m buffer)
Plantation/Invaded	Montane Grassland		Houses (200 m buffer)
			Buildings (200 m buffer)
			Seeps (200 m)
			CVB Wetlands (200 m)
			Rivers with floodplains (200 m buffer)
			Rocky Outcrops (200 m buffer)
			Protected Area (200 m buffer)

No infrastructure (including O&M buildings) may be placed within buffered No-Go areas (Figure 3). However, road infrastructure may need to be routed through sensitive areas for practical reasons. Existing road networks should be used as much as possible in these cases to limit the creation of additional roads which have known impacts on wildlife (Perumal et al. 2021).

To avoid bats roosting in new project infrastructure, all buildings must be properly sealed. If bats colonize

these spaces, a suitably qualified bat ecologist must be engaged to remove them.

Disturbance effects can be avoided by restricting construction activities to daylight hours (i.e., no construction at night) and avoiding blasting near rocky outcrops.

Mitigation (Minimize and Restore)

Modification and disturbance of bat habitat is likely to have species specific effects depending on species foraging guild, season, and distance to wind turbines (Barré et al. 2018, Leroux et al. 2022). For example, clutter edge species (e.g., Cape serotine) are more likely to be impacted by habitat modification given their greater association with physical habitat features compared to high-flying species (e.g., Egyptian free-tailed bat). As such, buffers may not be effective to fully remove all impacts.

Beyond avoidance, measures to minimize further impacts include minimizing the clearing of vegetation, minimizing disturbance and destruction of rocky outcrops, and applying good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. Where native trees, rocky outcrops or buildings need to be removed (although this must be avoided), these features must be examined by a suitably qualified bat ecologist before construction commences to search for roosting bats. Following construction, all areas disturbed must be rehabilitated through native species planting within all areas under the projects control.

IMPACT PHASE: CONSTRUCTION					
Nature of the impact: MODIFICATION & DISTURBANCE OF BAT HABITAT (ROOSTING, FORAGING, COMMUTING)					
Description of impact Removal of native vegetation, noise and dust generated during construction activities, and the presence of new infrastructure in the landscape, will negatively and indirectly impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement. Construction of WEF infrastructure could result in destruction and/or disturbance to bat roosts, and inadvertently provide new roosting spaces for some bat species in risky locations.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	1	1	3	2	2
With Mitigation	1	1	2	1	1
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	**Low Negative Impact (14)**			**Low Negative Impact (5)**	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: - Limit potential for bats to roost in project infrastructure (e.g., buildings, turbines) by ensuring they are properly sealed such that bats cannot gain access. - No construction activities at night. - No placement of infrastructure (except roads) in no-go areas. - Relocate the O&M building within a No-Go area (Figure A) or, minimize the footprint of the building, construct the building as far as possible away from the wetland within the identified footprint polygon, do not use any lighting at night. - No blasting near rocky crevices. - Minimize clearing of native vegetation - Minimize disturbance and destruction of rocky outcrops, trees and buildings, and where this is required, these features should be examined for roosting bats. - Apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).					

Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).

6.1.2 Operational Phase

IMPACTS

Bat mortality (direct impact) through collisions with wind turbine blades is the principal impact of wind energy facilities on bats during operation of the facility (Cryan and Barclay 2009, Arnett et al. 2016, Voigt et al. 2024). Displacement of bats from their preferred areas may also occur due to turbine noise emissions (Ellerbrok et al. 2024, Voigt et al. 2024).

Mitigation (Avoid)

Collisions can be avoided by not placing wind turbines in the vicinity of bat habitats which for bats includes both physical landscape features themselves (near wetlands, vegetation etc.) and open airspace away from these features (Schnitzler et al. 2003). Risk of collision impact is related to bat morphology with fast flying, open-air species more likely to be impacted than low-flying species who forage closer to the ground, in edge spaces near vegetation, or in dense cluttered spaces (Schnitzler et al. 2003, Thaxter et al. 2017, Aronson 2022). Impacts to low-flying species can be further avoided by ensuring blades do not sweep close to ground level (Figure 4).

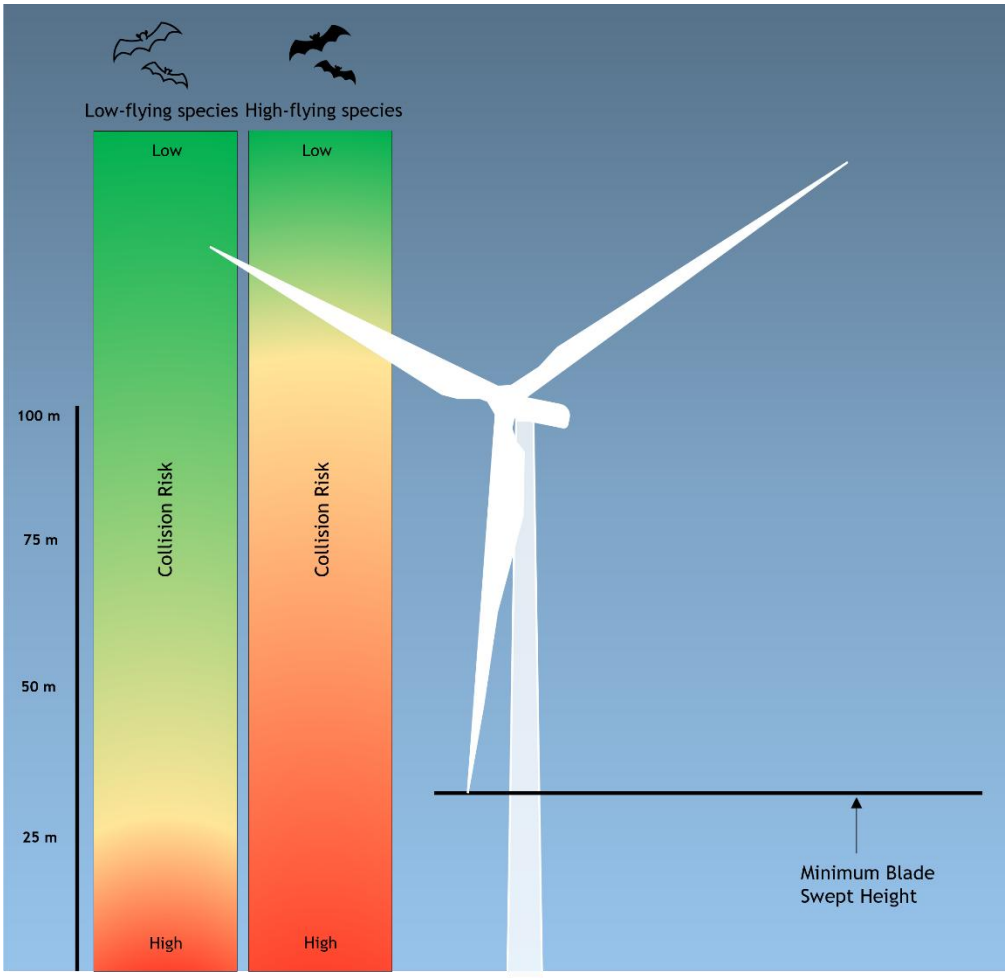

Figure 4: Conceptual Framework used to differentiate risk between low and high-flying bat species and the relationship with turbine size.

The species principally at collision risk from the proposed project are Cape serotine and Egyptian free-tailed bat since other species were recorded less often. High risk was identified for Cape serotine at ground level (represented by 10 m) at some locations (Table 3) but generally low risk at height (above 50 m). Activity is likely to decrease exponentially between these two heights (Wellig et al. 2018) meaning risk would decrease from high at 10 m to low at 50 m and above. The size of the rotor swept area should account for this because the lower the blades sweep the ground, the higher risk they will present to bats (Garvin et al. 2024). It is therefore recommended to maintain a minimum blade sweep of 30 m to avoid collision impacts as much as possible. There is limited published emperical evidence for this specific height but based on the activity of Cape serotine this is likely to be a reasonable height were risk would reduce from high to moderate or low.

Collision impacts can also be avoided by not installing wind turbines within or adjacent to key bat habitats, and adhering to the No-Go buffers (Figure 3). To ensure no parts of the wind turbines, including the blade tips, intrude into bat buffers, all 200 m buffers were adjusted (increased by 49 m) to account for the blade length and hub height of the assessed turbine in line with Mitchell-Jones and Carlin (2014) and based on the following equation:

[Eq. 1]

$$b = \sqrt{(buffer + bl)^2 - (hh - fh)^2}$$

$$b = \sqrt{(200 + 91)^2 - (150 - 0)^2}$$

$$b = 249\ m$$

Where:
b = adjusted/blade tip buffer
buffer = 200 m
bl: Turbine blade length = 91 m
hh: Hub height = 150 m
fh: Feature height = 0 m

The specific turbine height assessed in this report has a 150 m hub height and 91 m blade length, resulting in a minimum blade sweep of 59 m. Should the turbine size change, the adjusted/blade tip buffers must be updated to account for any changes in the hub height or blade length. No turbines are within buffered areas and hence the turbine layout is acceptable in its current form (Figure 3).

Mitigation (Minimize and Restore)

For some high-flying species such as Egyptian free-tailed bat, the habitat or land use below does not generally influence their activity (Monadjem et al. 2020) which makes habitat based mitigations (e.g., buffers) less effective. This species was recorded at 50 m and 90 m, where median activity levels suggest high risk during autumn and spring (Table 5). Mitigation to avoid impacts to higher-flying species should include the choice of turbine design since this has the potential to influence bat fatality (Barclay et al. 2007) but the impact of turbine size on bat fatality is poorly understood. Generally, impacts to high-flying species should be avoided by limiting the size of the rotor swept area as much as practicable since they are active across much of the rotor swept zone.

However, due to the characteristics of the species present on site, i.e., high risk, open-air foraging species, residual impacts could occur since there is still likely to be a high degree of risky airspace even with a minimized rotor swept area. In addition, some bats may be attracted to turbines (Horn et al. 2008, Cryan and Barclay 2009, Richardson et al. 2021, Guest et al. 2022, Leroux et al. 2022) once installed and operational and therefore additional mitigation measures would be needed to minimize impacts.

The first additional mitigation measure to minimize residual collision impacts is the use of **blade feathering** to prevent free-wheeling of blades below the turbine cut-in speed. This has been shown to reduce bat fatality with the benefit of not impacting on energy production (Young et al. 2011, Good et al. 2012).

During operation, bat fatality monitoring must be undertaken to search for bat carcasses beneath wind turbines to measure the residual impact of the WEF on bats for a minimum of two years (Aronson et al.

2020). Mitigation measures that are known to further minimize bat fatality if needed based on the fatality monitoring results include **curtailment** and/or **acoustic deterrents** (Arnett et al. 2013, Romano et al. 2019, Weaver et al. 2020). These techniques must be used if post-construction fatality monitoring indicates that species fatality thresholds have been exceeded (MacEwan et al. 2018) to minimize impacts, maintain the impacts to bats within acceptable limits of change and prevent declines in the impacted bat population. The bat fatality thresholds for the project were determined based on area of influence of the turbines of 4,774 hectares. This was based on a minimum convex polygon around all turbines, plus an additional buffer around this space of 110 m corresponding to the turbine blade length. Based on the bat fatality threshold for the Highveld Grasslands ecoregion (MacEwan et al. 2018), the bat fatality threshold for the Sheepmoor project is 38 bats per least concern species.

According to the threshold guidance (MacEwan et al. 2018), should the annual fatality threshold be exceeded, curtailment and/or acoustic deterrents must be used to reduce fatality levels to below the threshold. For frugivorous bats, conservation important or rare/range restricted bats, i.e., Species of Special Concern (SSC), the annual fatality threshold is 1 individual. The likelihood of SSC's being present on site is low (Table 2).

A Biodiversity Management Plan (BMP) for bats must be developed by a bat ecologist before commencement of operation which includes the post-construction fatality monitoring plan design, fatality thresholds calculations and rationale, and an adaptive management response plan that provides a timeous action pathway for mitigation (e.g. curtailment or deterrents) should fatality thresholds be exceeded. Smart curtailment approaches which shut down turbines based on real time bat acoustic activity data are favoured over blanket curtailment because these will be less disruptive to turbine operation.

Since displacement of bats is likely driven by turbine noise, this can be minimized by serration of the back edges of the blade, by using a low-noise blade airfoil design or with blade trailing-edge brushes (Bošnjaković et al. 2024; Ellerbrok et al. 2024).

IMPACT PHASE: OPERATION					
Nature of the impact: BAT FATALITY					
Description of impact Bat mortality (direct impact) through collisions and/or barotrauma with wind turbine blades is the principal impact of wind energy facilities on bats.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**

S=(E+D+R+M)*P	**High Negative Impact (70)**			**Moderate Negative Impact (36)**	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: - No placement of turbines and infrastructure (apart from roads and the OHL) within no-go areas - Maintain a minimum blade sweep of 30 m to avoid impacts to lower flying bats such as clutter-edge species (e.g., Cape serotine, Natal long-fingered bat). - Minimize the rotor diameter - Feather blades to prevent free-wheeling below the turbine cut-in speed - Implement post-construction fatality monitoring and apply smart curtailment or deterrents if fatality thresholds are exceeded.					
Residual impact	Curtailment and deterrents can successfully reduce bat fatality (Arnett 2011, Arnett et al. 2016, Weaver et al. 2020), but not completely. Through the application of fatality thresholds, residual impacts should be minimized.				

IMPACT PHASE: OPERATION					
Nature of the impact: DISPLACEMENT					
Description of impact Avoidance of wind turbines by bats, in some cases over several hundred meters distance, has been observed for various species in different habitats, including farmland, resulting in displacement impacts (Tolvanen et al. 2023, Voigt et al. 2024). Displacement, likely caused by wind turbine operation (e.g., wake turbulences and noise emissions), tends to increase with the number and size of turbines.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	3	4	3	3	3
With Mitigation	3	4	2	2	2

Mitigation measures to reduce residual risk or enhance opportunities: - Reduce turbine noise emissions by serration of the back edges of the blade, by using a low-noise blade airfoil design or with blade trailing-edge brushes (Bošnjaković et al. 2024; Ellerbrok et al. 2024).					
Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).				

6.1.3 Decommissioning Phase

IMPACTS

Impacts during the decommissioning phase will be indirect and involve disturbance to bats through excessive noise and dust, and damage to vegetation.

Mitigation (Avoid)

Disturbance effects can be avoided by restricting decommissioning activities to daylight hours (i.e., no works at night).

Mitigation (Minimize and Restore)

Disturbance can be minimized by applying good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning works. All areas disturbed must be rehabilitated through native species planting within all areas under the projects control.

IMPACT PHASE: DECOMMISSIONING					
Nature of the impact: DISTURBANCE OF BATS					
Description of impact Impacts during the decommissioning phase will be indirect and involve disturbance to bats through excessive noise and dust, and damage to vegetation.

Mitigation measures to reduce residual risk or enhance opportunities: - No decommissioning activities at night. - Apply good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning activities. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).		
Residual impact	Residual impacts are likely to be minor since ceasing project activities on site is likely to benefit bats.	

6.2 Grid Connection

6.2.1 Construction Phase

The direct impact of grid connection infrastructure is collisions with powerlines. Insectivorous bats are unlikely to collide with powerlines since they can avoid these obstacles using echolocation but fruit bats do collide with powerlines (Tella et al. 2020). The likelihood of occurrence for fruit bats species in the AoI is low (Table 2). Indirect impacts include loss of habitat to construct substations and OHL pylons, and ecological light pollution (Longcore and Rich 2004).

IMPACT PHASE: CONSTRUCTION					
Nature of the impact: MODIFICATION & DISTURBANCE OF BAT HABITAT (ROOSTING, FORAGING, COMMUTING)					
Description of impact Vegetation clearing for grid connection infrastructure (access roads, substation buildings, pylons), as well as noise and dust generated during the construction phase, will impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement (Kunz et al. 2007b, Millon et al. 2018, Bennun et al. 2021). This impact is likely to have species specific effects; clutter edge species (e.g., Cape serotine) are more likely to be impacted by habitat modification given their greater association with physical habitat features compared to high-flying species (e.g., Egyptian free-tailed bat). Construction of grid connection infrastructure could result in destruction (direct impact) of bat roosts (trees, buildings) and disturbance (indirect impact) of bat roosts potentially resulting in roost abandonment. Bat mortality can occur if roosts which contain bats are destroyed. Installation of new infrastructure in the landscape (e.g., buildings) can inadvertently provide new roosting spaces for some bat species, attracting them to areas with wind turbines and potentially increasing the likelihood of collisions.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	1	1	3	2	2
With Mitigation	1	1	2	1	1
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	**Low Negative Impact (14)**			**Low Negative Impact (5)**	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities:					

- Limit potential for bats to roost in project infrastructure (e.g., buildings) by ensuring they are properly sealed such that bats cannot gain access. - No construction activities at night. - No placement of pylons within 200 m of key habitat features specifically including buildings, dams/wetlands, and rivers/streams. The OHL itself is permitted to cross over No-Go Areas for practical routing reasons but pylon positions must avoid No-Go Areas where feasible. Therefore the maximum possible span should be implemented to avoid the sensitive area while ensuring the technical feasibility of the development. - No blasting near rocky crevices. - The construction compounds, laydown areas, and batching plants must avoid No-Go areas. - Minimize clearing of native vegetation - Minimize disturbance and destruction of rocky outcrops, native trees and buildings, and where this is required, these features should be examined for roosting bats. - Apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during construction. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).	
Residual impact	Residual impacts are likely to be minor although buffer distances have been shown to be ineffective at avoiding and minimizing risk to bats because these are two small for some species (Barré et al. 2018, Tolvanen et al. 2023).

6.2.2 Operational Phase

IMPACT PHASE: OPERATION					
Nature of the impact: LIGHT POLLUTION					
Description of impact Construction of grid infrastructure will increase ecological light pollution from artificial lighting associated with the substation and other operational and maintenance buildings. Light pollution can alter ecological dynamics (Horváth et al. 2009). Lighting attracts and can cause direct mortality of insects, reducing the prey base for bats, especially bat species that are light-phobic. These species may also be displaced from previous foraging areas due to lighting. Other bat species forage around lights, attracted by higher numbers of insects. This may bring these species into the vicinity of the project and indirectly increase the risk of collision with wind turbines.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	3	4	3	3	3
With Mitigation	3	4	2	2	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	**Moderate Negative Impact (39)**			**Low Negative Impact (22)**	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: - No placement of substations and operational and maintenance buildings within no-go areas. - Avoid excessive lighting - Use of motion-sensor lighting, avoid sky-glow by using hoods and downward facing lighting, increase spacing between lighting units, and use low pressure sodium lights (Rydell 1992, Stone 2012).					
Residual impact	Given the limited extent of light pollution currently in the region, the application of the above mitigation measures is likely to result in minor residual impacts.				

6.2.3 Decommissioning Phase

IMPACT PHASE: DECOMMISSIONING
Nature of the impact: DISTURBANCE OF BATS
Description of impact

Impacts during the decommissioning phase will be indirect and involve disturbance to bats through excessive noise and dust, and damage to vegetation.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	1	1	3	3	3
With Mitigation	1	1	2	2	2

Significance Calculation	Without Mitigation	With Mitigation
S=(E+D+R+M)*P	**Low Negative Impact (24)**	**Low Negative Impact (12)**
Was public comment received?	No	
Has public comment been included in mitigation measures?	No, no comments received	
Mitigation measures to reduce residual risk or enhance opportunities: - No decommissioning activities at night. - Apply good abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste) created during decommissioning activities. - Rehabilitate and enhance all areas disturbed during construction (including aquatic habitat).		
Residual impact	Residual impacts are likely to be minor since ceasing project activities on site is likely to benefit bats.	

6.3 Cumulative Impacts

For the purposes of the cumulative impact assessment (CIA), cumulative impacts are defined as the total impacts resulting from the successive, incremental, and/or combined effects of a project when added to other existing, planned and/or reasonably anticipated future projects, as well as background pressures (IFC 2013). The project considered here is the Sheepmoor Wind Energy Facility. The goal of this assessment is to evaluate the potential resulting impact to the vulnerability and/or risk to the sustainability of the bat species affected (IFC 2013).

6.3.1 Step 1: VECs and spatial-temporal boundary

Following guidance in IFC (2013), the first step in the CIA was to determine the Valued Environmental Components (VECs), the bat species most likely to be affected by cumulative impacts, and the temporal and geographic scope of the analysis.

Of the species recorded in the PAOI during the acoustic monitoring, and based on bat distribution records (ACR 2020), Cape serotine (*Laephotis capensis*), Natal long-fingered (*Miniopterus natalensis*) and Egyptian free-tailed bat (*Tadarida aegyptiaca*) are most likely to be impacted cumulatively. This is because they are the most widespread bat species in South Africa (Monadjem et al. 2020), classified as high risk species to wind energy impacts (MacEwan et al. 2020b), the most impacted by operating wind energy facilities in the country (Aronson 2022).

The temporal time frame over which cumulative impacts are considered was 25 years, the typical lifespan of a renewable energy facility. However, cumulative effects could extend beyond this timeframe if development of the cluster of three projects is phased over time.

The Ecologically Appropriate Area of Analysis (EAAA) for the assessment was determined by considering the ecology of the three VECs.

The acoustic monitoring confirmed the presence of Natal long-fingered bat in the PAOI, a migratory species which moves seasonally between winter hibernacula and summer maternity cave roosts in South Africa (van der Merwe 1975, Miller-Butterworth et al. 2003). In north-eastern South Africa, where the proposed development is planned, van der Merwe (1975) showed migration between maternity caves in Limpopo and hibernacula caves in Gauteng/North-West undertaken by pregnant females (who later return south with weaned pups), with caves separated by 150 km at least. Males typically undertake shorter movements

(> 60 km) between various highveld caves (van der Merwe 1975). This migration increases the potential that these bats will encounter wind turbines or be displaced by them (Millon et al. 2018), especially if these are placed along migratory routes. Although these movements are typically north-south, Pretorius et al. (2020) suggest that movement could also occur east-west between Gauteng and a maternity cave in Sudwala, Mpumalanga, a distance of approximately 250 km. Although additional research is needed to better understand long and short distance movements of Natal long-fingered bat in South Africa more precisely, given the numerous roost sites (both caves and mines) in Mpumalanga and body of work already demonstrating or suggesting migratory behavior in the north-east of the country between these sites, it is reasonable that cumulative impacts of wind energy may impact this species at large scales and hence cumulative impacts need to be assessed accordingly. Based on van der Merwe (1975), a 150 km radius around the PAOI was therefore defined as EAAA1 (Figure 5), especially since cumulative impacts should be evaluated across scales potentially affected species are likely to occur (Voigt et al. 2012, Lehnert et al. 2014).

The remaining VECs are not migratory and hence a second, smaller EAAA was used. Data on the spatial ecology of the Egyptian free-tailed bat and Cape serotine, specifically the sizes of their foraging or community ranges, are not available. Data from European free-tailed bat, *Tadarida teniotis*, in Portugal (Marques et al. 2004) and Serotine bat, *Eptesicus serotinus*, in England (Robinson and Stebbings 1997) were used as surrogates. Feeding areas for some *T. teniotis* individuals were over 30 km from their roost while the maximum distance between *E. serotinus* feeding areas was over 41 km.

Cumulative impact assessment in South African typically consider developments within a radius of 35 km which therefore is potentially in line with the movement ecology of the two VECs. Hence the EAAA2 was a 35 km radius around the PAOI.

6.3.2 Step 2: Other Activities and External Drivers

The second step in the CIA was to identify other past, existing, or planned activities within the EAAA1 and EAAA2 and to assess the external influences and stressors on the three VECs. With reference to the Renewable Energy Application database (Q2, 2024), currently one other wind energy project is located within the EAAA2, namely the Emvelo WEF. Approximately 35 other development projects are located within EAAA1 (Figure 5). Given that EAAA1 also includes a Renewable Energy Development Zone (REDZ), it is reasonable to expect further development over the 25-year period considered in this assessment.

There are no documented major past threats to Egyptian free-tailed bat and Cape serotine or current threats to them other than renewable energy (Child et al. 2016). Egyptian free-tailed bats can also be threated indirectly by roost disturbance, especially caves. This CIA considers renewable energy the primary impact to these VECs. Natal long-fingered bat is locally threatened in parts of its range by habitat loss resulting from conversion of land to agricultural use, incidental poisoning with insecticides, loss of prey base, and the disturbance of roosting and maternity caves (Child et al. 2016).

6.3.3 Step 3: Baseline Status of VECs

Egyptian free-tailed bat is very widely distributed, locally common and recorded from many protected areas in South Africa however, although the population is stable, the population size is unknown (Child et al. 2016). It is classified as Least Concern nationally and globally. This species is present in the PAOI and based on its activity levels, it is at high risk of collision during autumn and spring (Table 5). It is flexible in its habitat requirements and one reason for its wide distribution is its affinity to roost in buildings or other man-made structures (Monadjem et al. 2020).

Cape serotine is also widely distributed in South Africa with a large population and hence is classified as Least Concern nationally and globally. However, it is possible that this species comprises a complex of closely related species (Monadjem et al. 2020). The population trend is stable, but the population size is unknown. Although this species is present in the PAOI its activity levels suggest low risk of collision (Table 3) although no data between 10 m and 50 m were recorded on site to verify this. This species was recorded at 50 m, so it is reasonable to assume some level of risk between 10 m and 50 m. Cape serotine is also

flexible in its habitat requirements and its use of buildings and other anthropogenic structures as roosts has possibly led to its numbers increasing.

Natal long-fingered bat is a common and widespread species, classified as Least Concern nationally and globally with a stable national population, but it may be experiencing local declines (Child et al. 2016). The size of the national population is unknown but this species roosts in large colonies; De Hoop Guano cave in the Western Cape hosts approximately 200,000 individuals, and in the Highveld, some caves may contain up to 4000 individuals (Child et al. 2016). Activity levels of this species in the AoI were relatively low and this species was seldomly recorded in the rotor swept area but high activity was recorded closer to ground level in spring (Table 7).

6.3.4 Step 4: Assess Cumulative Impacts on VECs

The key potential impacts that could affect the long-term sustainability and/or viability of the three VECs in EAAA1 and EAAA2 are collisions with wind turbines. This may lead to local extinctions and fragmentation of the national population since bats have low reproductive rates (Barclay and Harder 2003). Other impacts may include displacement from foraging and commuting areas, and along migration routes, due to wind turbines (Millon et al. 2018, Leroux et al. 2022).

6.3.5 Step 5: Assess Significance of Predicted Cumulative Impacts

Rodhouse et al. (2019), Davy et al. (2020) and Frick et al. (2017) have all shown that in North America, Least Concern bats may be experiencing impacts due to wind farms that could result in changes to their conservation status. This may be a future scenario for widespread, common Least Concern bats species in South Africa. As such, the significance of cumulative impacts is assessed as High without mitigation. The application of mitigation measures is anticipated to reduce the overall cumulative impact of the project to a moderate level.

Nature of the impact: CUMULATIVE IMPACTS					
Description of impact The total impacts resulting from the successive, incremental, and/or combined effects of the project when added to other existing, planned and/or reasonably anticipated future projects, as well as background pressures.					
	Extent (E)	**Duration (D)**	**Reversibility (R)**	**Magnitude (M)**	**Probability (P)**
Without Mitigation	3	4	3	4	5
With Mitigation	3	4	2	3	3
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	**High Negative Impact (70)**			**Moderate Negative Impact (36)**	
Was public comment received?	No				
Has public comment been included in mitigation measures?	No, no comments received				
Mitigation measures to reduce residual risk or enhance opportunities: The mitigation measures proposed in this report (buffering key habitats used by bats, use of appropriate lighting technology, blade feathering, and using smart curtailment and/or acoustic deterrents) should be applied to all future projects so that there is a collective management responsibility (IFC 2013).					
Residual impact	Curtailment and deterrents can successfully reduce bat fatality (Arnett 2011, Arnett et al. 2016, Weaver et al. 2020), but not completely. Through the application of fatality thresholds across all projects in the cumulative impact area, residual impacts should be minimized.				

6.3.6 Step 6: Management of Cumulative Impacts

Management interventions for bats at operating wind farms in South Africa are guided by fatality thresholds, which aim to mitigate population-level impacts. These thresholds are set below the rate at which populations could decline due to anthropogenic pressures (MacEwan et al. 2018). For this project, thresholds have been established, and similar measures should be applied to all future wind energy developments. In theory, if each development implements thresholds and appropriate mitigation measures when exceedances occur, the EAAA1 and EAAA2 VEC populations should not decline due to wind energy impacts.

The mitigation measures proposed in this report (buffering key habitats used by bats, use of appropriate lighting technology, blade feathering, and using smart curtailment and/or acoustic deterrents) should be applied to all future projects so that there is a collective management responsibility (IFC 2013).

7 ENVIRONMENTAL MANAGEMENT PROGRAMME

Objective: Avoid and minimize modification of bat habitats			
Project component/s	All project infrastructure		
Potential Impact	Vegetation clearing for project infrastructure, as well as noise, dust and pollution generated during construction activities, will impact bats by removing habitat used for foraging and commuting, through disturbance, and displacement. Construction of WEF infrastructure could result in destruction and/or disturbance to bat roosts and inadvertently provide new roosting spaces for some bat species in risky locations.		
Activity/risk source	All construction activities and associated activities (e.g., driving)		
Mitigation: Target/Objective	1. Avoid potential for bats to roost in project infrastructure (e.g., buildings, and turbines) 2. Minimize disturbance to bats 3. Minimize habitat loss 4. Minimize displacement of bats		
Mitigation		**Responsibility**	**Timeframe**
1. Ensure all project infrastructure (e.g., buildings, and turbines) is properly sealed such that bats cannot gain access. 2. No construction activities at night, apply good construction abatement control practices to reduce emissions and pollutants (e.g., noise, erosion, waste). 3. No placement of infrastructure (except roads and OHL) within No-Go areas. 4. Minimize clearing of native vegetation, minimize disturbance and destruction of farm buildings on site, minimize removal of native trees. Rehabilitate and enhance all areas disturbed during construction, (including aquatic habitat). 5. Reduce turbine noise emissions by serration of the back edges of the blade, by using a low-noise blade airfoil design or using blade trailing-edge brushes.		Project Developer Contractor	During design and planning phase and throughout construction phase
Performance Indicator	No bat roosts are destroyed No bats colonise new project infrastructure for roosting No infrastructure in No-Go areas (except roads and OHL) All areas disturbed during construction are rehabilitated		
Monitoring	An appointed ECO must inspect all new project infrastructure, in conjunction with or via training from a bat ecologist, to ensure bats cannot gain access. ECO to ensure compliance with good construction abatement control practices. ECO must ensure no infrastructure is placed in No-Go areas (see Figure 3).		

	If a bat roost is encountered during construction, the ECO must consult a bat ecologist to determine appropriate actions. ECO to ensure all disturbed areas are rehabilitated. ECO to ensure turbine blades have appropriate noise-reduction technology.

Objective: Avoid and minimize bat fatality			
Project component/s	Wind turbines		
Potential Impact	Bat mortality through collisions with wind turbine blades.		
Activity/risk source	Operating Wind Turbines		
Mitigation: Target/Objective	1. Avoid bat fatalities through turbine layout design and turbine dimensions 2. Minimize bat fatalities using smart curtailment or deterrents during operation		
Mitigation		**Responsibility**	**Timeframe**
1. No placement of turbines in No-Go Areas (Figure 3). 2. Maintain a minimum blade sweep of 30 m to avoid impacts to lower flying bats such as clutter-edge species (e.g., Cape serotine, Natal long-fingered bat). 3. Minimize the rotor diameter 4. Feather blades to prevent free-wheeling below the turbine cut-in speed 5. Implement fatality monitoring throughout the operational phase 6. Apply smart curtailment or deterrents if fatality thresholds are exceeded. Annual fatality threshold per Least Concern species = 38 individuals. Annual fatality threshold per Species of Special Concern = 1 individual for each of [African Straw-coloured fruit bat, Wahlberg's Epauletted fruit bat, Percival's Short-eared Trident bat, Blasius's Horseshoe bat, Egyptian Rousette and Lessor Long-fingered bat].		Project Developer Operator	BMP developed prior to operation. BMP active throughout operation phase.
Performance Indicator	≤ 38 individuals per Least Concern species killed annually ≤ 1 individual per Species of Special Concern killed annually		
Monitoring	ECO must ensure no turbines are placed in No-Go areas, including the blade tips (Figure 3). ECO must ensure the dimensions of the final selected turbine adhere to requirements (A minimum blade sweep of 30 m). A Biodiversity Management Plan (BMP) for bats must be developed which includes the design of a post-construction fatality monitoring program (PCFM) for bats, and an adaptive management response plan that provides an escalating scale of mitigation should fatality thresholds be exceeded. ECO to ensure adherence to BMP and any mitigation measures implemented		

Objective: Reduce impact of light pollution	
Project component/s	All project infrastructure

Potential Impact	Construction of project infrastructure will increase ecological light pollution from artificial lighting associated with turbines, the substation and other operational and maintenance buildings. Light pollution can alter ecological dynamics (Horváth et al. 2009, Bará and C. Lima 2024). Lighting attracts and can cause direct mortality of insects, reducing the prey base for bats, especially bat species that are light-phobic. These species may also be displaced from previous foraging areas due to lighting. Other bat species forage around lights, attracted by higher numbers of insects. This may bring these species into the vicinity of the project and indirectly increase the risk of collision with wind turbines.		
Activity/risk source	Light sources from project infrastructure		
Mitigation: Target/Objective	1. Avoid light pollution 2. Minimize light pollution		
Mitigation		**Responsibility**	**Timeframe**
1. No placement of infrastructure within No-Go areas (Figure 3). 2. Use motion-sensor lighting, avoid sky-glow by using hoods and downward facing lighting, increase spacing between lighting units, and use low pressure sodium lights		Project Developer Operator	During design and planning phase and throughout operation phase.
Performance Indicator	Limited attraction of insects to light sources Limited foraging of bats around light sources Limited mortality at insects at light sources		
Monitoring	ECO must ensure no infrastructure is in No-Go areas (Figure 3). ECO must ensure motion-sensor lighting is used. ECO must ensure all lighting fixtures have hoods and/or are downward facing, where appropriate, to prevent sky-glow. ECO must ensure minimum lighting is used and lighting is spaced to prevent excessive use of lighting. ECO must ensure low-pressure sodium lighting is used.		

8 CONCLUSION

This EIA report assessed impacts to bats that could occur because of the construction, operation and decommission of the Sheepmoor WEF and grid connection. The assessment was based on 16 months of baseline data on bat activity recorded at the project. Based on these data, the key issue for the WEF will be managing collision impacts to Cape serotine and Egyptian free-tailed bat, and cumulative impacts.

The first mitigation measure proposed to manage risk is to adhere to the no-go buffers which aim to spatially avoid impacts by buffering key habitat features used by bats. This measure is likely to be effective for most bat species recorded at the project, but additional mitigation measures are needed to avoid impacts to free-tailed bats, which forage high in the air, and to reduce residual impacts.

Turbine design can be effective, and it is recommended to maintain a minimum blade sweep of at least 30 m. However, free-tailed bats will still collide with turbine blades above this height and as such, the rotor diameter must be limited as much as practicable to minimize the space where collisions might occur. Additionally, blade feathering must be implemented to limit the rotation of turbine blades below the turbine cut-in speed when electricity is not being generated.

Mitigation measures to minimize residual impacts after the application of the above measures include smart curtailment and acoustic deterrents. As such, the project should consider the cost and feasibility of these measures. The residual impacts must be monitored using post-construction fatality monitoring for a minimum of two years (Aronson et al. 2020). Smart curtailment and/or acoustic deterrents must be used if this monitoring indicates that species fatality thresholds have been exceeded (MacEwan et al. 2018) to maintain the impacts to bats within acceptable limits of change and prevent declines in the impacted bat populations.

The overall impact to bats was assessed as moderate after the application of the mitigation measures proposed to avoid and minimize impacts to bats. However, on a species level, the project presents differential risk and impacts to bats must be managed adaptively during the operational phase, particularly for those species (e.g. Egyptian free-tailed bat and Cape serotine) for which high risk is predicted during some periods.

This adaptive management will be guided by the Environmental Management Programme for bats which must include the development of a Biodiversity Management Plan (BMP) to manage impacts to bats during the operation of the facility. The BMP for bats must be developed by a bat ecologist before the commencement of operation and must include the post-construction fatality monitoring plan design, fatality thresholds calculations and rationale (updated as required), and an adaptive management response plan that provides a timeous action pathway for mitigation, including roles and responsibilities, should fatality thresholds be exceeded. Provided these measures are adhered to, the project assessed can be approved.

Cell phone	[redacted]
E-mail	Jbaronson1@gmail.com

2. DECLARATION BY THE SPECIALIST

I, Jonathan Aronson declare that –

- I act as the independent specialist in this application;
- I am aware of the procedures and requirements for the assessment and minimum criteria for reporting on identified environmental themes in terms of sections 24(5)(a) and (h) and 44 of the National Environmental Management Act (NEMA), 1998, as amended, when applying for environmental authorisation which were promulgated in Government Notice No. 320 of 20 March 2020 (i.e. "the Protocols") and in Government Notice No. 1150 of 30 October 2020.
- I will perform the work relating to the application in an objective manner, even if this results in views and findings that are not favourable to the applicant;
- I declare that there are no circumstances that may compromise my objectivity in performing such work;
- I have expertise in conducting the specialist report relevant to this application, including knowledge of the Act, Regulations and any guidelines that have relevance to the proposed activity;
- I will comply with the Act, Regulations and all other applicable legislation;
- I have no, and will not engage in, conflicting interests in the undertaking of the activity;
- I undertake to disclose to the applicant and the competent authority all material information in my possession that reasonably has or may have the potential of influencing –
    - any decision to be taken with respect to the application by the competent authority; and;
    - the objectivity of any report, plan or document to be prepared by myself for submission to the competent authority;
- All the particulars furnished by me in this form are true and correct; and
- I realise that a false declaration is an offence in terms of Regulation 48 and is punishable in terms of section 24F of the NEMA Act.

Subject: Re: Mulilo Amsterdam Final Layout - [12 AUG 225]

Dear Lucien,

Thank you for sharing these updated layouts. We have perused them and have a few queries:

1. Why have the respective WEF boundaries changed from what was submitted in our specialist reports released for public comment on 15 July?
2. As a result of these changes, according to the KMZs, it appears there have been additions/removals re the affected properties included in each WEF site – can you please provide us with an updated list of the affected properties per project?
3. Also, the following turbines appear to be located on both Emvelo and Sheepmoor WEFs as the site boundaries include the same properties: WTGs 18, 21, 26, 27, 28, 29, 30. Can you please clarify why this is the case?

Thank you, we look forward to your soonest feedback.

Once we have your feedback and clarification regarding this, we can commence with updating the maps in the reports.

Best regards / Vriendelike groete,

Albert

EXTERNAL MESSAGE

Hi Lucien and ERM team,

I trust you are all well.

A big week ahead in the Amsterdam process. Please take note of the following:

- Please may you provide Albert with the information requested below ASAP. Please may you also follow up with all specialists to ensure that they have received the updated layout and are aware of the timelines.
- Please may you also ensure that Mr Meyer is responded to, he requested the information he requested be provided and responded to by today.
- Please ensure to circulate the transcript and Minutes to Mr Meyer for him and his peers review and approval.
- Please follow up with the DFFE, DARDLEA and MPTA, reminding them of the PP dates and dates for final submission.
- Please provide an update on the compilation of the FEIARs, Final applications and Final EMPrs.
- Lastly, Mr Meyer mentioned that he asked Schalk (Socio Economic assistant) a number of questions for which he did not receive responses from, please could you contact him and check?

Thank you.

Kind Regards,

EXTERNAL MESSAGE

Dear Lucian,

Your request is received but kindly note the following:

Due Dates - Due to committed site visits taking place on 11 and 12 August 2025, unfortunately it is not possible to meet the due date of 12 August 2025. The revised issue date must consider both the updating and internal reviews which would be at least one (1) week.

Variation Order - Our team will review the final layouts and determine whether the changes will require and Addendum Letter or Full Revisions to be issued. The time and effort for updating the reports (full revisions) will require a variation order which will be confirmed and communicated to you for approval.

Trust you find the above in order.

Kind regards

Dear Specialist,

I trust you are well.

Please find attached the final layout for the proposed Amsterdam WEF as received from the applicant. Kindly update your respective specialist reports to reflect this final layout, and to submit your revised reports by Monday, 12 August 2025.

If, for any reason, you anticipate that you will not be able to meet this deadline, please inform me as soon as possible so that we can explore alternative arrangements.

Thank you for your continued support and contributions to the project. Should you have any questions or require any additional information, please don't hesitate to reach out.

Kind regards,

Subject: Re: Mulilo Amsterdam Final Layout - [12 AUG 225]

Dear Lucien,

Thank you for sharing these updated layouts. We have perused them and have a few queries:

1. Why have the respective WEF boundaries changed from what was submitted in our specialist reports released for public comment on 15 July?
2. As a result of these changes, according to the KMZs, it appears there have been additions/removals re the affected properties included in each WEF site – can you please provide us with an updated list of the affected properties per project?
3. Also, the following turbines appear to be located on both Emvelo and Sheepmoor WEFs as the site boundaries include the same properties: WTGs 18, 21, 26, 27, 28, 29, 30. Can you please clarify why this is the case?

Thank you, we look forward to your soonest feedback.

Once we have your feedback and clarification regarding this, we can commence with updating the maps in the reports.

Best regards / Vriendelike groete,

Albert

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

We acknowledge your request for a meeting to discuss the concerns raised. In consultation with the applicant, Mulilo, we are proposing a provisional date of Wednesday, 7 August 2025, with the meeting to be held at a venue in Ermelo. Kindly confirm whether this date is suitable for you and whether you will be attending alone or accompanied by others.

As a registered I&AP, your comments form an important part of the formal public participation process and will be incorporated into the Final EIA Reports. We also acknowledge the concerns raised regarding the tagging of the Martial Eagles. Relevant documentation, including permits, will be made available where appropriate to support transparency and clarity during the engagement.

We look forward to your response.

Subject: Re: FW: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

On Wed, Jul 16, 2025 at 4:41 PM Josua Meyer <meyerjosua55@gmail.com> wrote:

> Goodday Sir

The avifaunal specialist removed in both reports, Sheepmoor WEF and Emvelo WEF, the High Sensitivity - Turbine Exclusion Zone in Figures 33 for the aquatic buffer zones from an avifaunal perspective.

It must be an unintentional mistake and request reinstatement of it.

If it was deliberate we request the detailed reasoning and motivation for such a drastic decision.

Thanks

Josua Meyer

>
> Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.
>
> Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in

line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Subject: Re: Mulilo Amsterdam Final Layout - [12 AUG 225]

Dear Lucien,

Thank you for sharing these updated layouts. We have perused them and have a few queries:

1. Why have the respective WEF boundaries changed from what was submitted in our specialist reports released for public comment on 15 July?
2. As a result of these changes, according to the KMZs, it appears there have been additions/removals re the affected properties included in each WEF site – can you please provide us with an updated list of the affected properties per project?
3. Also, the following turbines appear to be located on both Emvelo and Sheepmoor WEFs as the site boundaries include the same properties: WTGs 18, 21, 26, 27, 28, 29, 30. Can you please clarify why this is the case?

Thank you, we look forward to your soonest feedback.

Once we have your feedback and clarification regarding this, we can commence with updating the maps in the reports.

Best regards / Vriendelike groete,

Albert

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

We acknowledge your request for a meeting to discuss the concerns raised. In consultation with the applicant, Mulilo, we are proposing a provisional date of Wednesday, 7 August 2025, with the meeting to be held at a venue in Ermelo. Kindly confirm whether this date is suitable for you and whether you will be attending alone or accompanied by others.

As a registered I&AP, your comments form an important part of the formal public participation process and will be incorporated into the Final EIA Reports. We also acknowledge the concerns raised regarding the tagging of the Martial Eagles. Relevant documentation, including permits, will be made available where appropriate to support transparency and clarity during the engagement.

We look forward to your response.

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

To: ERM Arcus Amsterdam <ERM.ArcusAmsterdam@erm.com>
Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development

Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Subject: REMINDER: Submission of Draft Environmental Impact Assessment Report for the Proposed Emvelo WEF

Dear Bathandwa and Masina,

I hope this message finds you well.

This is a courteous reminder that the PPP period for the proposed Emvelo and Amsterdam Wind Energy Facilities will close on 15 August 2025. We would appreciate confirmation that we will receive your comments by this date.

For your information, the Mpumalanga Tourism and Parks Agency (MTPA) has been afforded until 18 August 2025 to submit their comments.

Please do not hesitate to contact me should you require any further information.

Kind Regards,

ERM

Subject: Submission of Draft Environmental Impact Assessment Report for the Proposed Emvelo WEF

DFFE Reference: 14/12/16/3/3/2/2611

The Project Developer, under the Special Purpose Vehicles (SPVs), namely Emvelo Wind Energy Facility (Pty) Ltd intend to submit an application for Environmental Authorisation (EA) for the proposed Emvelo WEF including its associated infrastructure. The proposed WEF will include 22 turbines with a maximum output capacity of up to 260 MW and an anticipated lifespan of 30 years. The WEFs will all connect directly into National Eskom Grid via the Eskom Camden Substation. Each WEF will apply for authorisation of a proposed grid connection route to connect to the existing Eskom Camden Substation, via approximately 30 km long 132 kV overhead transmission lines.

In terms of Chapter 5 of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA), and the Environmental Impact Assessment (EIA) Regulations, 2014 (as amended), the Project Applicant appointed Environmental Resources Management Southern Africa (Pty) Ltd (ERM), to act as the Environmental Assessment Practitioner (EAP) project manager and to undertake the Scoping and Environmental Impact Assessment (S&EIA) process for Environmental Authorisation (EA).

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025.

The Draft Environmental Impact Assessment (EIA) Report for the Emvelo WEF and associated infrastructure is being subjected to a second public commenting period of 30-days, from Tuesday, 15 July 2025 until Thursday, 14 August 2025 (both days inclusive), taking into consideration Chapter 2 Regulation 3 (1); (2) and (3) of the NEMA, 1998 (Act No. 107 of 1998). Comments received during the first Draft EIA phase were incorporated, addressed and responded to in this Draft EIA report.

As per the Directions, dated 5 June 2020, all Applications must be submitted in electronic format via electronic file transfer.

Separate zipped folders have been uploaded to the DFFE electronic submission platform. The folders submitted are as below:

ZIP: Emvelo WEF Application and Draft EIA Report

- 01 Updated Application Form
- 02 Volume I: Draft EIA Report
- 03 Volume II: Specialist EIA Reports
- 04 Volume III: Public Participation Reports

Please feel free to contact the undersigned should you have any queries.

CC: Lucien Barbeau; Stephen Burton; Stephanie Gopaul
Subject: RE: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Hi Lucien, I have looked into this, and their main concerns are:-

Aerodrome Safety:

1. The Trust is the owner of Portions 8, 19 and 28 of the Roodewal Farm (Farm number 270), On Portion 28, they operate an aerodrome and helipad that regularly accommodates aircraft such as Learjets and KingAirs. The airstrip is actively used and aircraft land and take off in both directions of the runway.
2. Civil Aviation Regulations (Part 139) and SA-CATS 139.01.30 require that no wind turbines be erected within 8 km of an aerodrome or within 35 km due to potential interference with radio navigation equipment.
3. The Trust opposes any turbines within 35 km of its aerodrome boundary.

Environmental and Visual Impact:

4. The farm also hosts the Nu-Scotland Nature Conservancy, which accommodates guests and wildlife, including endangered Secretary Birds.
5. The Trust is concerned about the visual intrusion and ecological disruption caused by the turbines.
6. They request that the visual impact assessment consider the conservancy and that mitigation measures be implemented to protect local fauna.

I believe we need the Mulilo , visual and avifaunal specialists' inputs to respond.

Kind Regards

Dear Interested and Affected Party,

Please note that the public comment period for the Draft Environmental Impact Assessment (EIA) Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities has been extended by one day, due to the public holiday on 9 August 2025.

The revised comment period now ends on 15 August 2025.

All other details remain unchanged. We encourage you to submit your comments by the new deadline should you wish to have your input considered in the Final EIA Report.

Thank you for your continued participation.

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Comments made by B Moodie

1. I am the owner of the farm Windhoek 291 Portion 3 & 5 and leaser of portion 4 & 10 which are adjacent to the proposed development of the Sheepmoor Windfarm'

Acknowledged. Your ownership and leasehold details have been noted and recorded for the project.

2. No communication or notification from Mulilo concerning the development the windfarm next to my property. Neighbours informed me of it and helped me to register as I&AP in March 2025. Mulilo acting on there own and ignore all protocols and spells danger for the future.

Notification of the project was undertaken in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations, including the placement of site notices, newspaper adverts, direct notification to identified landowners, and availability of project information for registration as an Interested and Affected Party (I&AP). We acknowledge that you became aware of the project through neighbours, and we will ensure that you continue to receive all project-related updates going forward.

3. May 2025 draft report suggested power lines will be constructed over my Windhoek property. There was no prior communication nor negotiations from any party concerning the permission for the power lines. Totally unacceptable.

The draft EIA report included an alternative grid connection layout and this is not the preferred route. Your opposition to any overhead lines crossing your land has been noted.

4. No power lines will be allowed to run over my properties for various reasons.

4.1 Route as shown in report are crossing crop lands and will interfere with activities of farm machinery.

4.2 It will limit future expansions on the farm.

4.3 Increase movement of people for inspection line will increase criminal activities and risk of veld fires and therefore not acceptable.

4.4 Indications that power lines have negative influence on the reproduction of cattle. Unplanned and poorly communicated maintenance visits especially if involving helicopters and machinery can spook cattle, leading to stampedes, Injuries, or even loss of livestock not to mention damage to infrastructure like fencing.

4.5 Aesthetic and Environmental Value will be lost.

4.6 Danger due to collusion of the bird population on the farm.

The potential impacts on farming operations, farm expansion, security, livestock health, aesthetic value, and avifauna have been recorded and assessed as part of the EIA report

5. There is secretary birds present on my farm which are foddering on the grassland where 4 turbines are planned on Windhoek Portion 8. These secretary birds will be in great danger to be killed by collusion with the turbines.

Avifaunal specialist studies have identified several sensitive bird species within the project area. Turbine placements have all been mitigated, and the avifaunal specialist is confident that the data and modelling undertaken to date to address avifaunal impacts is both accurate and credible.

6. The same danger exists for the ibises which are in great numbers present on the farm. Some are roosting on the farm Waaihoek to the east and other on the farm Windhoek to the north - west. Both roosting routes will be polluted with turbines and the shredding of birds will be unavoidable, even with proposed mitigation gimmies.

Please see above response regarding avifaunal impacts.

7. I apposed the location of the 4 turbines close to the eastern border because.

7.1 Killing of the southern bald ibis which due that route to there roosting site.

7.2 Located in the secretary bird foddering area.

7.3 Combined effect will change the local microclimate of surrounding area. Report by specialist of influence on microclimate are requested.

7.4 It is visual not acceptable.

7.5 The noise pollution will increase during the dominate eastern winds.

7.6 The lights during the night as required by aviation are not acceptable.

Your concerns regarding turbine placement near the eastern border and on Portion 8 have been recorded, including potential impacts on avifauna, microclimate, noise, visual character, lighting, and shadow flicker. The microclimate aspect is outside the standard EIA scope, however, specialist studies have addressed noise, visual, and shadow flicker impacts, with recommendations and mitigations that the applicant will adhere to.

8. Also opposed the turbines on the Farm Windhoek Portion 8

8.1 Killing the southern bald ibis on their route to their breeding nest in the winter.

8.2 Turbine 51 & 52 to close to my boundary in case of collapsing when the steep slope considered

8.3 Turbine 51,52 & 53 will be to close to the farmhouse on Windhoek Por 4 and will cause unaccepted noise pollution which are likely to be more due to the topography.

8.4 There are people staying in the same farmhouse which are on chronical medication for heart and epilepsy. The shadow flickering of turbines 51, 52 and 53 will trigger the epilepsy.

Please see above response regarding the impacts associated with turbine placements.

9. It will kill the bee population in the area which are essential for pollination of the fauna. Report of effect on the bee population by specialist are requested.

At present, this aspect is not covered within the EIA specialist studies, however, your request for further investigation has been noted and will be shared with the project team.

10. Further the proposed Sheepmoor windfarm are going to negatively damage the character and scenic views of the escarpment and will change the sense of place.

Visual impact assessments have been conducted by a qualified specialist. While any large infrastructure will have some visual impact, the design and placement of turbines aims to reduce the visual impact where possible.

11. Therefore, we apposed the proposed Sheepmoor windfarm in the strongest terms.

Your overall opposition to the proposed Sheepmoor Wind Farm is noted and will be included in the Final Comments and Responses Report submitted to the competent authority for decision-making.

Dear Lucien,

Thank you for sharing these updated layouts. We have perused them and have a few queries:

1. Why have the respective WEF boundaries changed from what was submitted in our specialist reports released for public comment on 15 July?
2. As a result of these changes, according to the KMZs, it appears there have been additions/removals re the affected properties included in each WEF site – can you please provide us with an updated list of the affected properties per project?
3. Also, the following turbines appear to be located on both Emvelo and Sheepmoor WEFs as the site boundaries include the same properties: WTGs 18, 21, 26, 27, 28, 29, 30. Can you please clarify why this is the case?

Thank you, we look forward to your soonest feedback.

Once we have your feedback and clarification regarding this, we can commence with updating the maps in the reports.

Best regards / Vriendelike groete,

Albert

Subject: Mulilo Amsterdam Final Layout - [12 AUG 225]

Dear Specialist,

I trust you are well.

Please find attached the final layout for the proposed Amsterdam WEF as received from the applicant. Kindly update your respective specialist reports to reflect this final layout, and to submit your revised reports by Monday, 12 August 2025.

If, for any reason, you anticipate that you will not be able to meet this deadline, please inform me as soon as possible so that we can explore alternative arrangements.

Thank you for your continued support and contributions to the project. Should you have any questions or require any additional information, please don't hesitate to reach out.

Kind regards,

EXTERNAL MESSAGE

Dear Lucian,

Your request is received but kindly note the following:

Due Dates - Due to committed site visits taking place on 11 and 12 August 2025, unfortunately it is not possible to meet the due date of 12 August 2025. The revised issue date must consider both the updating and internal reviews which would be at least one (1) week.

Variation Order - Our team will review the final layouts and determine whether the changes will require and Addendum Letter or Full Revisions to be issued. The time and effort for updating the reports (full revisions) will require a variation order which will be confirmed and communicated to you for approval.

Trust you find the above in order.

Kind regards

Hi Lloyd,

Please note that we have received comments and concerns from an I&AP who operates a landing strip near the proposed development.

These comments were originally submitted on 22 April after the previous Draft EIA Phase PPP period. The I&AP has now resubmitted the same comments during the current PPP period.

Given the nature of the concerns raised, and that the submission has come via the I&AP's legal representative, we kindly request that the Mulilo legal team review the comments and provide any necessary input.

Regards,

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Hi Lloyd,

Please note that we have received comments and concerns from an I&AP who operates a landing strip near the proposed development.

These comments were originally submitted on 22 April after the previous Draft EIA Phase PPP period. The I&AP has now resubmitted the same comments during the current PPP period.

Given the nature of the concerns raised, and that the submission has come via the I&AP's legal representative, we kindly request that the Mulilo legal team review the comments and provide any necessary input.

Regards,

EXTERNAL MESSAGE

Dear Sir/Madam

We have briefly perused the draft EIA report and have been unable to find any reference to the comment submitted by us on the instructions of our client, a copy of which is attached to this email.

Kindly refer us to the relevant pages of the draft report which deal with our client's comments?

We further note from the draft report that a formal application has been lodged with Air Traffic and Navigation Services (ATNS) for a formal obstacles assessment to be conducted. Kindly furnish us with a copy of this application and all communications to and from ATNS relating thereto.

We look forward to hearing from you as a matter of urgency.

Regards

Dear Interested and Affected Party,

Please note that the public comment period for the Draft Environmental Impact Assessment (EIA) Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities has been extended by one day, due to the public holiday on 9 August 2025.

The revised comment period now ends on 15 August 2025.

All other details remain unchanged. We encourage you to submit your comments by the new deadline should you wish to have your input considered in the Final EIA Report.

Thank you for your continued participation.

EXTERNAL MESSAGE

Hi Lucien,

Thank you for following up, response provided below:

Thank you for your comment and for identifying the interaction between the proposed Amsterdam Wind Energy Facility and the existing Camden–Edwaleni 1 transmission line.

We confirm that we will follow the required Eskom processes to apply for and, where appropriate, request relaxations of relevant clearance and servitude standards. We remain committed to engaging with Eskom's technical team following the approval of the Environmental Authorisation to ensure that any infrastructure interfaces are addressed in line with your requirements.

The site selection process for the project has considered a large assessment area and evaluated various technical and environmental constraints, which provides flexibility for potential adjustments if required. We have also considered alternative configurations during the planning phase, which will assist in working collaboratively to achieve a mutually acceptable solution.

We look forward to continued engagement with Eskom to address this matter in a coordinated manner.

Kind Regards,

Lloyd Barnes

We remain committed to engaging with Eskom's technical team following the approval of the Environmental Authorisation to ensure that any infrastructure interfaces are addressed in line with your requirements.

The site selection process for the project has considered a large assessment area and evaluated various technical and environmental constraints, which provides flexibility for potential adjustments if required. We have also considered alternative configurations during the planning phase, which will assist in working collaboratively to achieve a mutually acceptable solution.

We look forward to continued engagement with Eskom to address this matter in a coordinated manner.

Kind Regards,

Lloyd Barnes

Hi Lloyd,

We have received feedback from the NTCSA (below) indicating that Amsterdam affects the Camden–Edwaleni 1 line.

Could you please confirm whether any agreements or arrangements are currently in place to facilitate the connection of the existing line to Camden? If so, kindly provide any relevant details or supporting documentation that could assist in addressing this matter within the Final EIA Report.

Kind Regards

Subject: [CAUTION:EXTERNAL EMAIL] Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Good day Khululwa, I hope this email finds you well.

Thank you for your comment and for identifying the interaction between the proposed Amsterdam Wind Energy Facility and the existing Camden–Edwaleni 1 transmission line.

We confirm that we will follow the required Eskom processes to apply for and, where appropriate, request relaxations of relevant clearance and servitude standards. We remain committed to engaging with Eskom's technical team following the approval of the Environmental Authorisation to ensure that any infrastructure interfaces are addressed in line with your requirements.

The site selection process for the project has considered a large assessment area and evaluated various technical and environmental constraints, which provides flexibility for potential adjustments if required. SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP)

Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Good day ERM,

Please see attached for our comments on the revised draft EIA's for both Emvelo and Sheepmoor WEFs.

Kind Regards
Robyn

Dear Robyn,

We intend to submit the FEIAr on the 25th of August 2025 and we are commitment to thoroughly addressing all comments received during the Public Participation Process.

We acknowledge that this process requires both time and resources, and as such, we are limited in our ability to extend the timeline beyond 15 August 2025. That said, we fully recognise the challenges faced in accessing the Draft EIA documents. If you are unable to submit your comments by the 15th, we're willing to accept them by the 18th of August to ensure you have had a full and fair opportunity to review and engage with the Draft EIA documents.

Additionally, should the Mpumalanga Tourism and Parks Agency (MTPA) or MDARDLEA still wish to engage further on our applications, we would be happy to arrange a physical meeting at a mutually convenient time. Please feel free to let us know if such an engagement would be of interest.

Regards,

EXTERNAL MESSAGE

Correction to my email below:
Public Participation reports for both WEFs and the specialist reports for Emvelo WEF were only available on 16 July 2025.

>>> Sindy Mbuyane 07/17/25 10:27 AM >>>
Dear All,

Please also note that our office has not yet received the hard copies. In the future, kindly ensure that reports are dispatched to all relevant offices at the same time so that the regulated timelines can commence and conclude on the same dates.

Kind Regards,
Sindi

>>> Robyn Luyt 07/17/25 10:23 AM >>>
Dear Lucien,

I can confirm that all documents are now on the website.

However, given that I&APs only had access to the full reports on 16 July and not 15 July (ie. Specialist Reports for Both WEFs, and the specialist reports for the Emvelo WEF were only accessible on 16 July 202), would this not mean that the regulated 30 days commences on 17 July and ends on 18 August (since 17 Aug is a Sunday) ?

Kind Regards
Robyn

Hi Robyn,

The configuration for each WEF's documents is as follows:

- 02 Volume I: Draft EIA Report
- 03 Volume II: Specialist EIA Reports
- 04 Volume III: Public Participation Reports

Hi Lucien,

The reports I was able to access for each WEF are titled "Public Participation Volume III". Does this imply that there are there are 2 more volumes for each WEF ?

Regards
Robyn

Hi Robyn

Thanks for your message.

1. The full Public Participation Reports for Emvelo and Sheepmoor are available on the website now — kindly do check again. Let us know if you still can't access them.

https://www.erm.com/public-information-sites/proposed-amsterdam-wind-energy-facility-and-auxiliary-infrastructure-cluster-mpumalanga/

1. We've extended the comment period by one day, so it now ends on 15 August 2025. A notice will be sent out shortly.
2. Please see the attached updated layout and shapefiles, including all turbines and infrastructure.

Let us know if you need anything else.

Regards

Subject: Outstanding info: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province
Importance: High
EXTERNAL MESSAGE

Good day Stephanie and Lucien,

1. Please provide links to the full Public Participation Reports for both Emvelo and Sheepmoor. Only the cover pages for the public participation reports are available.
2. You have stated that the public comment period is from 15 July to 14 Aug. However it seems you have not accounted for the public holiday on 9 Aug, which would mean that the 30 day comment period ends on 15 Aug. However the 30 comment period should only commence when we have access to the full reports (ie. we await the public consultation reports).
3. It is our understanding - based on the meeting that was held in Nelspruit - that the layouts have changed. Please urgently provide the shapefiles, which we require to undertake our review. Shapefiles to include turbines and all infrastructure.

Kind Regards
Robyn

Morning Lucien,

Please can you provide the specialist report for the Emvelo WEF as only the specialist report for Sheepmoor is provided on the weblink.

Many thanks
Kind regards
Gavin

Dear Madam,

REVISED DRAFT ENVIRONMENTAL IMPACT ASSESSMENT REPORT: ACTIVITIES ASSOCIATED WITH THE EMVELO WIND ENERGY FACILITY ON PORTIONS 1, 2, 5 & RE OF THE FARM SCHIMMELHOEK 272 IT, AND PORTIONS 1, 2, 5, 6 & RE OF THE FARM SCHIEDAM 274 IT; THE ASSOCIATED GRID CONNECTION ON PORTIONS 1, 2, 5, 6 & RE OF THE FARM SCHIEDAM 274 IT, PORTIONS 2, 3, 4, 6, 9, 11, 12 & 13 OF THE FARM WAAIHOEK 286 IT, PORTION 7 OF THE FARM WITPUNT 267 IT, REMAINDER OF THE FARM ONVERWACHT 273 IT, PORTIONS 1 & 6 OF THE FARM ZWARTWATER 288 IT, PORTIONS 3, 4, 5, RE 6, 9, 10 & 11 OF THE FARM WELTEVREDEN 289 IT, THE REMAINDER, RE 1, RE 9, RE 11, RE 14 AND PORTIONS 7 & 8 OF THE FARM MOOIPLAATS 290 IT, PORTION 8 OF THE FARM BOSJESSPRUIT 291 IT, AND PORTIONS 1 & 2 OF THE FARM WELGELEGEN 322 IT; AND ASSOCIATED ACCESS ROADS ON PORTIONS 6, 7, 12, 23 & 26 OF THE FARM ROODEWAL 272 IT AND PORTIONS 1, 2, 3, 4 & 26 OF THE FARM ONVERWACHT 273 IT, MSUKALIGWA LOCAL MUNICIPALITY

The revised draft environmental impact assessment report which was submitted by you in respect of the abovementioned application and received by the Department on 16 July 2025 has reference. The Department has considered the content of the report, and has the following comments:

1. The layout provided in the initial draft EIAR included 24 turbines. It was not explicit in the revised draft EIR, which now includes 22 turbines, but after scrutinizing the layout plan and the responses provided in the comments and response report (CRR), we have been able to ascertain the following changes: The removal of WTG 24; the movement of WTG 21 out of Emvelo and into the Sheepmoor site; and slight changes to the localities of WTGs 3, 7, 12, 13, 14, 19, 20, 22, 23 and 25. None of the turbines that were moved or micro-sited have been moved into less sensitive areas. Sixteen (16) of the 22 turbines proposed in the current layout, all of which were flagged in our previous comments, are still located in sensitive areas. Given that the requirement to avoid impacts in accordance with the mitigation hierarchy has not been adequately addressed, **these comments must be read in conjunction with our comments dated 10 April 2025, which still stand.**
2. The proposed Emvelo Wind Energy Facility and associated grid infrastructure is located on a site comprising: CBA Irreplaceable and Optimal; Intact Grassland Patches; Key Biodiversity Areas; the Grasslands Important Bird Area (IBA); Ecological Support Areas; National Protected Area Expansion Strategy Areas (NPAES); Threatened Ecosystems – including Wakkerstroom Montane Grassland and Eastern Highveld Grassland; CBA: Aquatic Rivers; ESA: Strategic Water Source Area; ESA: Wetlands and ESA: Important Subcatchments.

3. Furthermore, the proposed Emvelo WEF and associated grid connection is located in an area comprising a high fauna sensitivity, a high diversity of threatened bird species, and a high number of priority species for wind energy developments and power lines, including the following confirmed on site: African Grass Owl, African Marsh Harrier, Blue Crane, Cape Vulture, Denham's Bustard, Greater Flamingo, Grey Crowned Crane, Lanner Falcon, Martial Eagle, Secretarybird, Southern Bald Ibis, Sensitive Species 23, White-bellied Bustard, and Yellow-breasted Pipit.
4. According to the Avifaunal Assessment, a total of 253 bird species could potentially occur in the Broader Area where the Emvelo WEF and associated Grid Connection Infrastructure are proposed to be located. Of the 253 species, 38 species are classified as priority species for wind energy developments, of which 32 were recorded during pre-construction monitoring. Of the 253 species, 76 are considered power line sensitive species, 57 of which were recorded during the pre-construction monitoring.
5. DARDLEA is not supportive of development of WEFs (or any non-compatible land use) within Critical Biodiversity Areas and Key Biodiversity Areas, or within intact grassland patches. In respect of Intact Grassland Patches, it is important to note that the Mpumalanga Biodiversity Sector Plan (MBSP) specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened fauna and avifauna. This is verified in the faunal assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area". Intact Grassland Patches are important source areas in terms of metapopulation dynamics. The MBSP - adopted in 2023 (Provincial Notice 279 of 2023) - is a planning tool that has been developed to manage biodiversity resources of the province by setting strategic objectives to ensure that spatial biodiversity and climate change priorities are effectively incorporated into land-use and development planning, environmental assessments and authorisations, and natural resource management within Mpumalanga Province. The links to the various reports and shape files, including the MBSP Technical Report which details the scientific methods used to identify Intact Grassland Patches, can be accessed at https://mtpa.maps.arcgis.com/sharing/rest/content/items/fc6d8f9e7ef84d2f87f86b91e8e9f87a/data).
6. While we acknowledge efforts to acquire GPS tracking data for Martial Eagle, the modelling of the data and the datasets must be subjected to additional independent peer-reviewed analyses in order to verify accuracy and confidence levels. In the absence of this, the precautionary approach, which is the application of sector-accepted buffers, must be applied.
7. While we acknowledge the methodology applied to inform the Avifaunal Specialist's Sensitivity Zones (Very High, High and Medium) for Martial Eagle and Southern Bald Ibis, confidence in the methodology also requires testing through a broad, formal peer-reviewed analysis within the avifaunal sector, which is beyond the scope of an EIA. Until this is achieved, a precautionary approach is warranted, as follows:
    7.1. In accordance with BirdLife SA's Bird Monitoring Reports from Operational Wind Energy Facilities in South Africa (2025), a nest buffer of 6km is recommended for Martial Eagles (which report also states that that the available data suggests that this buffer will not eliminate the risk of collisions, and that it would be necessary to implement additional mitigation measures outside of this area).
    7.2. A minimum buffer of 1km from Southern Bald Ibis colonies.
8. Similarly, turbines and all associated infrastructure, including access roads as well as the upgrading of existing roads (which are currently seldom-used jeep tracks), must avoid Yellow-breasted Pipit habitat entirely, i.e. both "Very High" and "High" sensitivity zones. It is also concerning to note that in the initial draft EIA, the Avifaunal Specialist had designated the modelled Yellow-breasted Pipit habitat entirely as "Very High Sensitivity – No-go Zone", but has in the revised report, incorporated a new "High Risk – Turbine exclusion zone" into the initial no-go zone, for, what it appears, the purpose of accommodating Collector networks and road networks. The Avifaunal Specialist does recommend moving Turbine 23 as it is located in the

turbine exclusion zone, but as indicated above, infrastructure – including roads and collector networks within Yellow-breasted Pipit habitat is not supported.

9. Given the limited data available on Species 23 movements and collision risks, the curtailment strategy for turbines proposed in the "Medium Sensitivity" Zone for the species is not supported. Mitigation strategies that have no data to validate their success cannot be used to replace the requirement for avoidance. All Turbines and all associated infrastructure must avoid Species 23 habitat entirely, i.e. in "Very High", "Medium" and "High" sensitivity zones.
10. The Avifaunal Report confirms the presence of Species 23, but the location is not disclosed. The Avifaunal Assessment must confirm how the recommended sensitivity zones for Species 23 align with BirdLife SA's "Guidelines for surveying and mitigating impacts on [Species 23] in avifaunal assessments for development applications", particularly in respect of the following excerpt of the guideline that specifies a 5km buffer to be applied to suitable wetlands:

    "*Birds function at a wider ecological scale than most upper-catchment wetlands, thus requiring a larger and interconnected species buffer zone to ensure adequate impact mitigation from developments. Literature from studies on waterbirds, particularly rallids, provides several recommendations for designing and implementing buffer zones. As a general guideline for developments with collision risks, like wind turbines,* ***buffer zones of at least 5 km between the development and wetlands suitable for the [Species 23] are recommended, with buffer zones of at least 1 km for delineated wetland inputs*** *(e.g., streams and aquifers), aquatic-habitat corridors (e.g., riverine habitat), and potential movement pathways between wetlands".*

11. The number of turbines that are located in areas recommended for avoidance (at least 16 out of 22), and the location of the roads, construction camps and OHLs in sensitive areas demonstrates that the site is not compatible with the proposed land use. The areas of concern as they relate to the abovementioned comments, are outlined below:
    11.1. WTG 3 – KBA; NPAES; Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.2. WTG 4 – Within 5km Martial Eagle Buffer.
    11.3. WTG 5 – Edge of High Risk Turbine Exclusion Zone for Sp23 (Highlighted in Revised Avifaunal Assessment to be moved); Within 5km Martial Eagle Buffer; Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.4. WTG 7 - Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.5. WTG 10 – Within 5km Martial Eagle Buffer.
    11.6. WTG 11 – Within 5km Martial Eagle Buffer; Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.7. WTG 12 – Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved); KBA.
    11.8. WTG 13 – Intact Grassland, Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved); Edge of High Risk Turbine Exclusion Zone for Sp23 (Highlighted in Revised Avifaunal Assessment to be moved); Faunal High Sensitivity - escarpment (highest category); IBA; NPAES.
    11.9. WTG 14 – CBA Optimal (no evidence of "invasion"); Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved); Edge of Intact Grassland; Fauna High Sensitivity; NPAES; IBA.
    11.10. WTG 15 - Partially within an untransformed CBA Irreplaceable, Edge of High Risk Turbine Exclusion Zone for Sp23 (Highlighted in Revised Avifaunal Assessment to be moved); Within 5km Martial Eagle Buffer; NPAES; KBA; Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.11. WTG 17 – KBA; IBA; NPAES.
    11.12. WTG 19 – Intact Grassland; IBA; NPAES; Faunal High Sensitivity - escarpment (highest category); Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved); Medium Risk Zone for Sp23.
    11.13. WTG 20 - Intact Grassland; Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved);

Medium Risk Zone for Sp23; Faunal High Sensitivity - escarpment (highest category); NPAES.

11.14. WTG 22 – Intact Grassland; Faunal High Sensitivity - escarpment (highest category); NPAES; IBA; within 5km Martial Eagle Buffer.

11.15. WTG 23 – Intact Grassland; Within 5km Martial Eagle Buffer; Yellow-breasted Pipit habitat (Highlighted in Revised Avifaunal Assessment to be moved); Medium Risk Zone for Sp23; Faunal High Sensitivity - escarpment (highest category); IBA; NPAES.

11.16. WTG 25 – Intact Grassland; Faunal High Sensitivity - escarpment (highest category); Within 5km Martial Eagle Buffer; Rotor-swept area penetrates High Risk Turbine Exclusion Zone for Southern Bald Ibis (Highlighted in Revised Avifaunal Assessment to be moved); Medium Risk Zone for Sp23; NPAES; IBA.

12. The following infrastructure is located in sensitive areas:
    12.1. The entire Grid in the southern Emvelo site: Intact Grassland; Faunal High Sensitivity - escarpment (highest category); High Avifauna Sensitivity (Due to, inter alia, the large amount of wetlands/drainage lines and natural grasslands).
    12.2. Portions of the OHL and access roads in southern Emvelo site: Intact Grasslands, which is confirmed High Sensitivity for Fauna, but note that intact grassland also crucial for avifauna).
    12.3. Collector network and Roads in Southern portion of Emvelo are in Yellow-breasted Pipit habitat (noting that upgrading seldom used jeep tracks will still have substantive impacts for the species).
    12.4. The construction camp is located adjacent to WTG15, which is in the Avifaunal Medium Risk Zone for Sp23 (which was recommended for removal by the Avifaunal Specialist).
13. Turbines locations in terms of Bat Sensitivity could not be confirmed. The Figures in the Bat Specialist Report dated February 2025 were once again not provided. We have not been able to determine whether any turbines in the current layout – following the re-positioning of turbines since the bat assessment was undertaken - are located in No-Go areas for Bats.
14. The Terrestrial Assessment (inclusive of Plant Species), did not apply the Site Ecological Importance (SEI) methodology, which is a requirement of the Species Environmental Assessment Guideline. The Species Protocols specifically stipulate that assessments "must be undertaken in accordance with the *Species Environmental Assessment Guideline"* (South African National Biodiversity Institute, 2020. Species Environmental Assessment Guideline. Guidelines for the implementation of the Terrestrial Fauna and Terrestrial Flora Species Protocols for environmental impact assessments in South Africa. South African National Biodiversity Institute, Pretoria). Non-compliance with the *Species Environmental Assessment Guideline* has resulted in the following deficiencies:
    14.1. Insufficient time was allocated to surveying in the appropriate season (only 4 days for both Sheepmoor and Emvelo WEF sites, as well as the Grid sites).
    14.2. The classification of the Montane Grassland on site as "moderate sensitivity" in the absence of applying all relevant criteria, including *inter alia*, conservation importance, functional integrity, receptor resilience, as well as species of conservation concern, spatial priorities, intact grassland patches, and CBAs.
    14.1. The montane ridge (where WTGs 13, 19, 20, 22, 23 and 25, along with grid infrastructure are proposed), which also coincides with intact grassland and the highest sensitivity for Fauna (according to the Faunal Assessment), being classified as "moderate sensitivity". (Noting further that according to the Fauna Assessment, "the high sensitive escarpment area is likely of general importance for a range of faunal groups, <u>representative of a large contiguous and ecologically intact area</u> <u>of mostly good-quality montane grassland</u>". If the correct and required criteria are applied, the classification of this area is more likely to be classified as "High" or "Very High Sensitivity".
15. As a result of the deficiencies in the Terrestrial Assessment outlined above, we have low confidence in the associated impact analysis, and dispute the Specialist's "low" significance ratings.
16. The Impact Analyses in respect of Avifauna and Fauna are also disputed.
    16.1. The Avifaunal Assessment recommended that 9 turbines in high risk zones be relocated, but this has not been implemented in the layout presented as the preferred alternative.

This is misleading; the impact analysis must be based on the layout presented, which would translate to High Significance ratings for all impacts assessed with respect to Avifauna.

16.2. The Fauna Assessment recommendations included moving turbines out of High Sensitivity Areas for Fauna. The Impact Analysis was therefore not undertaken on the layout that was presented, and is accordingly disputed. The significance ratings for impacts assessed with respect to fauna should remain High.

17. While an Oribi Management Plan has been undertaken and included in this revised draft EIA (not in the initial draft EIA), it cannot be motivation to mitigate the potential impact on the species. The Oribi Management Plan clearly states that an "Oribi baseline assessment will be required to understand the current status of the subpopulation, including distribution and population estimates". The report further states that the "WEF layout needs to minimise number of turbines and infrastructure (including laydown)".
18. Biodiversity Offset Strategy:
    18.1. According to the Biodiversity Offset Guideline, "*The desired outcome of biodiversity offsets is to ensure that - the cumulative impact of an authorised activity, or activities, and land and resource use change does not: result in the loss of irreplaceable biodiversity or jeopardise the ability to meet biodiversity targets; lead to any ecosystem with a threat status of Vulnerable or Least Concern becoming Endangered; or any Endangered ecosystem becoming Critically Endangered; or cause an irreversible decline in the conservation status of species and the presence of special habitats; or cause a significant loss in ecosystem services*". A biodiversity offset cannot therefore cater for the loss of Irreplaceable CBAs or intact grasslands. As detailed in the comments above, intact grasslands are crucial for supporting threatened fauna and avifauna.
    18.2. The Biodiversity Offset Guideline specifically states that "biodiversity offsets are not appropriate when an activity, or activities, will have residual impacts on biodiversity of very high significance, including when residual negative impacts will result in loss of irreplaceable biodiversity".
    18.3. In addition to Irreplaceable CBAs, the Biodiversity Offset Guideline also categorises the following as "irreplaceable biodiversity": Biodiversity of major potential concern, where residual impacts in this category could lead to – loss of vulnerable or potentially irreplaceable biodiversity in areas of recognised importance, such as – areas evaluated as having High Ecological Site Importance. We maintain that the correct and required implementation of the Species Environmental Assessment Guideline would have resulted in the Montane Grassland being classified as having High Ecological Site Importance.
    18.4. The Intact Grassland Patches on the site must therefore be avoided, and cannot be offset. The requirement to consider biodiversity offsets is applicable only once it has been demonstrated that all measures of avoidance have been exhausted. The loss of irreplaceable biodiversity cannot be offset, and, as outlined above, "irreplaceable biodiversity" includes, key ecological corridors recognized as important for evolutionary processes and climate change adaptation where no options to safeguard these processes exist.
    18.5. Furthermore, the Biodiversity Offset Report does not meet the following minimum requirements:
        i. A portfolio of candidate biodiversity offset sites, including the likelihood of each site's availability and feasibility.
        ii. The required biodiversity outcomes on each of the candidate biodiversity offset sites.
19. Cumulative Impact Assessment:
    19.1. In our comments dated 10 April 2025 on your original draft EIA, despite bringing another 5 approved and in-process WEFs (within a 35 km radius) to your attention (i.e. Zephyr, Ujekamanzi Ntabande and Daggafoort and Emvelo), your revised cumulative impact assessment once again fails to mention or assess these. Subsequently, there are now an additional 3 WEFs within 35 km that are now in-process, i.e. Leghoya WEF 1, 2 & 3, and another one (1) within a 55 km radius (i.e. Anemoi WEF).

19.2. Furthermore, although section 4.3.3 states that "the scope of this assessment will include all operational, approved or current and planned renewable energy applications", in addition to the approved or in-process WEFs identified in 17.1. above (not included in this assessment), there are actually an additional two (2) WEFs within 35 km and a further two (2) proposed WEFs (i.e. Pre-Application) within a 55 km radius, that have not been identified. The total number of turbines within 35 km is more than double that indicated in both the Draft EIA and Revised Draft EIA reports, i.e. 435 (and not 192) and within a 55 km radius there are more than 663 turbines (approved, in-process and proposed). As a minimum, the cumulative impact of approved and in-process applications must be assessed.

19.3. The potential cumulative impact on avifauna, as indicated in our comments dated 10 April 2025, is now therefore likely to be even more substantial, due to the increased number of proposed turbines in the surrounding landscape. Of particular concern is the potential cumulative impact on Martial Eagles and Cape Vultures. The BirdLife South Africa Occasional Report Series 3: Summary of Bird Monitoring Reports from Operational Wind Energy Facilities in South Africa (February 2025), indicates that at current fatality rates due to collisions with wind turbines, "fatalities of Martial Eagles may already be exceeding the Potential Biological Removal (PBR) rate". Furthermore, "if current fatality rates at operational wind farms continue, at least 37 Cape Vultures could be lost to turbine collisions annually, representing a significant portion of the PBR. This figure is most probably an underestimate" (see limitations in the report) "and does not account for the anticipated acceleration of wind energy development. Unless other human-induced threats, such as powerline electrocutions and collisions, and poisoning, are urgently addressed, the population may not be able to withstand the added impact of turbine collisions."

19.4. Further to our comments dated 10 April 2025 and considering the additional WEFs in the surrounding landscape, we are now even more concerned about the cumulative impacts of these facilities on Oribi habitat, as expressed in the faunal assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area".

19.5. DFFE also requires that "the cumulative impact assessment for all identified and assessed impacts must indicate the following: (a) Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e. hectares of cumulatively transformed land". The Revised EIA Report does again not accurately quantify the size of the identified impacts, i.e. hectares of cumulatively transformed land. The overall footprint size of this, and all other similar proposed and approved renewable energy facilities within a 35 km radius is now 178 017.24 ha (Approved: 31 440.17 ha, In Progress: 89 247.96 ha, Pre-Application: 57 329.11 ha). Again, as a minimum, the cumulative impact of approved and in-process applications must be assessed.

19.6. As there has been no amendment in the revised EIA Report to the number of facilities identified surrounding this proposed facility, or a comprehensive comparative cumulative assessment undertaken, our previous comments on this matter dated 10 April 2025 remain unchanged, i.e. the cumulative impact assessment undertaken as part of this EIA does not adequately assess the cumulative impacts of this proposed facility, in relation to current and future similar renewable development facilities in the surrounding area.

20. Environmental Management Programme:

20.1. Our concerns related to the EMPr raised previously, still remain. The EMPr is unclear and vague, ambiguous, and does not provide adequate mitigation measures, timeframes, roles, responsibilities and reporting to adequately mitigate the potential impacts of this facility.

20.2. Given that we do not agree with the impact analyses undertaken in the EIA, the measures included in the EMPr as mitigation are, similarly, disputed.

20.3. The EMPr does not include a specific, measurable and timebound framework for decision-making regarding the duration of monitoring, and the specific circumstances for extension or curtailment.
20.4. The EMPr must be clear on when additional research is required.
20.5. Landowners must understand all access requirements and impacts associated with monitoring *throughout the lifespan of a project*.
20.6. Lease agreements must ensure that the effectiveness of monitoring is not compromised, and that restrictions do not compromise monitoring requirements in any way.

21. Public Participation:
21.1. In paragraph 9.3.2 (page 280) of the EIA Report, it is stated that "A comprehensive record of all comments received to date along with detailed responses from the Environmental Assessment Practitioner (EAP), specialists, and the project applicant is presented in the Comments and Responses Report (Volume II). For transparency and ease of reference, the original comments and corresponding responses are also appended to this volume". Then in the Paragraph 6 of the Public Participation Report (Volume III), it states that "During the DEIAR PPP comments were received from I&AP's. Follow-up e-mails were sent to all registered I&APs, stakeholders and authorities, and comments were received. Responses to comments received during the PP period are provided in Section 7, Table 7.1 below, with EAP / specialist / applicant responses, and the original comment and responses has been appended to the PP report which will be submitted with the FSR for DFFE decision".
21.2. However, in the copies of Emails included in the Public Participation Report, comments were submitted to you on 4, 9 and 10 April 2025 by: Megan Kim Govender; Adelma Vorster (Retsrov Boerdery); Celine Oats (Richard Summers Inc.); and Elize Robberts. *These comments have not been incorporated in your Comments and Response Report, nor have copies of the comments been appended to the Public Participation Report.*

Based on what has been outlined above, at least more than half (i.e. 16) of the 22 turbines proposed are located in unsuitable areas. Furthermore, the application of no-go buffers in accordance with BirdLife SA's Guidelines for surveying and mitigating impacts on [Species 23] referred to herein would likely increase the number of turbines that are in unsuitable areas. In light of this, and in conjunction with the location of associated roads, OHLs and cabling in CBAs, intact grasslands, and avifauna and fauna high sensitivity areas, DARDLEA cannot support the application in its current format.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

Dear Madam,

DRAFT ENVIRONMENTAL IMPACT ASSESSMENT REPORT: ACTIVITIES ASSOCIATED WITH THE SHEEPMOOR WIND ENERGY FACILITY ON THE FARM KLIPFONTEIN 283 IT, PORTIONS 1, 2 & 6 OF THE FARM SCHIEDAM 274 IT, PORTIONS 2, 3, 5, 6, 7, 9, 10 & 13 OF THE FARM WAAIHOEK 286 IT, RE 1 & PORTION 5 OF THE FARM VAALBANK 285 IT, PORTION 3 OF THE FARM ONVERWACHT 287 IT, AND PORTIONS 1 & 8 OF THE FARM WINDHOEK 291 JT; THE ASSOCIATED GRID CONNECTION ON PORTIONS 2, 3, 4 & 12 OF THE FARM WAAIHOEK 286 IT, PORTION 8 OF THE FARM WINDHOEK 291 IT, RE OF THE FARM ONVERWACHT 287 IT, PORTIONS 3, 4, 5, 6, 9, 10 & 11 OF THE FARM WELTEVREDEN 290 IT, RE, RE 1, PORTIONS 7 & 8, RE 9, RE, 11, RE 14 OF THE FARM MOOIPLAATS 290 IT, PORTION 8 OF THE FARM BOSJESSPRUIT 291 IT, PORTION 2 OF THE FARM 292 IT, PORTIONS 1 & 2 OF THE FARM WELGELEGEN 322 IT, PORTION 6 OF THE FARM ZWARTWATER 288 IT, AND PORTION 7 OF THE FARM WITPUNT 267 IT; AND ASSOCIATED ACCESS ROADS ON PORTIONS 6, 7, 12, 23 & 26 OF THE FARM ROODEWAL 272 IT, AND PORTIONS 2, 3, 4 & 7 OF THE FARM ONVERWACHT 273 IT, MSUKALIGWA LOCAL MUNICIPALITY

The revised draft environmental impact assessment report (EIAR)which was submitted by you in respect of the abovementioned application and received by the Department on 16 July 2025 has reference. The Department has considered the content of the report, and has the following comments:

1. The layout provided in the initial draft EIAR included 29 turbines. It was not explicit in the revised draft EIR, which now includes 25 turbines, but after scrutinizing the layout plan and the responses provided in the comments and response report (CRR), we have been able to ascertain the following changes: The removal of WTGs 35, 39, 47 and 49, and the addition of WTG 21 (i.e. the removal of four turbines). A total of 10 turbines have been moved, but of these, only one has been moved into an area without sensitivities. Seventeen (17) of the 25 turbines proposed in the current layout, all of which were flagged in our previous comments, are still located in sensitive areas. Given that the requirement to avoid impacts in accordance with the mitigation hierarchy has not been adequately addressed, **these comments must be read in conjunction with our comments dated 10 April 2025, which still stand.**
2. DARDLEA remains concerned that the proposed location of the Sheepmoor WEF and associated grid infrastructure is not compatible with the desired land use.

3. The proposed Sheepmoor Wind Energy Facility and associated grid infrastructure is located on a site comprising: CBA Irreplaceable and Optimal; Intact Grassland Patches; Key Biodiversity Areas; the Grasslands Important Bird Area (IBA); Ecological Support Areas; National Protected Area Expansion Strategy Areas (NPAES); Local-scale and Landscape-scale Climate Change Corridors; Threatened Ecosystems – including Wakkerstroom Montane Grassland and Eastern Highveld Grassland; CBA: Wetlands; CBA: Aquatic Rivers; ESA: Strategic Water Source Area and ESA: Important Subcatchments.
4. Furthermore, the proposed Sheepmoor WEF and associated grid connection is located in an area comprising a high fauna sensitivity, a high diversity of threatened bird species, and a high number of priority species for wind energy developments and power lines, including the following confirmed on site: African Fish Eagle, African Grass Owl, African Harrier-Hawk, African Marsh Harrier, Amur Falcon, Black Sparrowhawk, Black-winged Kite, Black-winged Lapwing, Black-winged Pratincole, Blue Crane, Cape Vulture, Common Buzzard, Denham's Bustard, Greater Flamingo, Grey Crowned Crane, Grey-winged Francolin, Jackal Buzzard, Lanner Falcon, Long-crested Eagle, Marsh Owl, Martial Eagle, Rufous-breasted Sparrowhawk, Secretarybird, Southern Bald Ibis, Sensitive Species 23, Spotted Eagle-Owl, White Stork, White-bellied Bustard, and Yellow-breasted Pipit.
5. According to the Avifaunal Assessment, a total of 253 bird species could potentially occur in the Broader Area where the Sheepmoor WEF and associated Grid Connection Infrastructure are proposed to be located. Of the 253 species, 38 species are classified as priority species for wind energy developments, of which 32 were recorded during pre-construction monitoring. Of the 253 species, 76 are considered power line sensitive species, 57 of which were recorded during the pre-construction monitoring.
6. DARDLEA is not supportive of development of WEFs (or any non-compatible land use) within Critical Biodiversity Areas and Key Biodiversity Areas, or within intact grassland patches. In respect of Intact Grassland Patches, it is important to note that the Mpumalanga Biodiversity Sector Plan (MBSP) specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened fauna and avifauna. This is verified in the faunal assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area". Intact Grassland Patches are important source areas in terms of metapopulation dynamics. The MBSP - adopted in 2023 (Provincial Notice 279 of 2023) - is a planning tool that has been developed to manage biodiversity resources of the province by setting strategic objectives to ensure that spatial biodiversity and climate change priorities are effectively incorporated into land-use and development planning, environmental assessments and authorisations, and natural resource management within Mpumalanga Province. The links to the various reports and shape files, including the MBSP Technical Report which details the scientific methods used to identify Intact Grassland Patches, can be accessed at https://mtpa.maps.arcgis.com/sharing/rest/content/items/fc6d8f9e7ef84d2f87f86b91e8e9f87a/data).
7. While we acknowledge efforts to acquire GPS tracking data for the Martial Eagle, the modelling of the data and the datasets must be subjected to additional independent peer-reviewed analyses in order to verify accuracy and confidence levels. In the absence of this, the precautionary approach, which is the application of sector-accepted buffers, must be applied.
8. While we acknowledge the methodology applied to inform the Avifaunal Specialist's Sensitivity Zones (Very High, High and Medium) for Martial Eagle and Southern Bald Ibis, confidence in the methodology also requires testing through a broad, formal peer-reviewed analysis within the avifaunal sector, which is beyond the scope of an EIA. Until this is achieved, a precautionary approach is warranted, as follows:
    8.1. In accordance with BirdLife SA's Bird Monitoring Reports from Operational Wind Energy Facilities in South Africa (2025), a nest buffer of 6km is recommended for Martial Eagles

(which report also states that that the available data suggests that this buffer will not eliminate the risk of collisions, and that it would be necessary to implement additional mitigation measures outside of this area).

8.2. A minimum buffer of 1km from Southern Bald Ibis colonies.

9. Similarly, turbines and all associated infrastructure, including access roads as well as the upgrading of existing roads (which are currently seldom-used jeep tracks), must avoid Yellow-breasted Pipit habitat entirely, i.e. both "Very High" and "High" sensitivity zones.
10. Given the limited data available on Species 23 movements and collision risks, the curtailment strategy for turbines proposed in the "Medium Sensitivity" Zone for the species is not supported. Mitigation strategies that have no data to validate their success cannot be used to replace the requirement for avoidance. All Turbines and all associated infrastructure must avoid Species 23 habitat entirely, i.e. "Medium", "High" and "Very High" sensitivity zones.
11. The Avifaunal Report confirms the presence of Species 23, but the location is not disclosed. The Avifaunal Assessment must confirm how the recommended sensitivity zones for Species 23 align with BirdLife SA's "Guidelines for surveying and mitigating impacts on [Species 23] in avifaunal assessments for development applications", particularly in respect of the following excerpt of the guideline that specifies a 5km buffer to be applied to suitable wetlands:

    "*Birds function at a wider ecological scale than most upper-catchment wetlands, thus requiring a larger and interconnected species buffer zone to ensure adequate impact mitigation from developments. Literature from studies on waterbirds, particularly rallids, provides several recommendations for designing and implementing buffer zones. As a general guideline for developments with collision risks, like wind turbines,* ***buffer zones of at least 5 km between the development and wetlands suitable for the [Species 23] are recommended, with buffer zones of at least 1 km for delineated wetland inputs*** *(e.g., streams and aquifers), aquatic-habitat corridors (e.g., riverine habitat), and potential movement pathways between wetlands".*

12. The number of turbines that are located in areas recommended for avoidance (at least 17 out of 25), and the location of the O&M building, roads and OHLs in sensitive areas demonstrates that the site is not compatible with the proposed land use. The areas of concern as they relate to the abovementioned comments, are outlined below:
    12.1. WTG 26: Intact grassland; IBA; NPAES; Fauna High Sensitivity - escarpment (highest category); Within 5km Martial Eagle buffer; Less than 1km from Southern Bald Ibis colony; Species 23 Avifaunal Medium Zone.
    12.2. WTG 27: Intact grassland; IBA; NPAES; Fauna High Sensitivity - escarpment (highest category); Within 1km of Southern Bald Ibis colony; Species 23 Avifaunal Medium Zone.
    12.3. WTG 28: Intact grassland; IBA; NPAES; Fauna High Sensitivity - escarpment (highest category); Within 1km of Southern Bald Ibis colony; Species 23 Avifaunal Medium Zone.
    12.4. WTG 29: Intact grassland; IBA; NPAES; Fauna High Sensitivity - escarpment (highest category); Within 1km of Southern Bald Ibis colony; Species 23 Avifaunal Medium Zone.
    12.5. WTG 30: Intact grassland; Partial IBA; NPAES; Fauna High Sensitivity - escarpment (highest category).
    12.6. WTG 31: Intact grassland; NPAES; Species 23 Avifaunal Medium Zone.
    12.7. WTG 33: Intact grassland partial; NPAES.
    12.8. WTG 36: CBA Irreplaceable; NPAES.
    12.9. WTG 38: High/Very High Terrestrial Sensitivity.
    12.10. WTG 41: Within 650m of Southern Bald Ibis Colony.
    12.11. WTG 42: Within 1km of Southern Bald Ibis Colony.
    12.12. WTG 43: Climate change corridor; Intact grassland; ESA; NPAES.
    12.13. WTG 44: Climate change corridor; ESA; NPAES; Species 23 Avifaunal Medium Zone.
    12.14. WTG 46: High/Very High Terrestrial Sensitivity.
    12.15. WTG 45: CBA Irreplaceable; NPAES, Climate change corridor; Species 23 Avifaunal Medium Zone.
    12.16. WTG 52: Climate change corridor; Intact grassland; ESA; IBA; NPAES.

12.17. WTG 53: Climate change corridor; Intact grassland; ESA; IBA; NPAES; High/Very High Terrestrial Sensitivity.
12.18. The O&M Building is located in Bat No-Go area.
12.19. The road network, collector network, and transmission lines traverse the Avifaunal All Infrastructure Exclusion Zone, the High Fauna Sensitivity Zone, Intact Grasslands, CBAs and ESAs.

13. It is noted that the Noise Specialist recommended the relocation of WTGs 29 and 30, and the reduction of the number of turbines within 800m of receptors.
14. The Terrestrial Assessment (inclusive of Plant Species), did not apply the Site Ecological Importance (SEI) methodology, which is a requirement of the Species Environmental Assessment Guideline. The Species Protocols specifically stipulate that assessments "must be undertaken in accordance with the *Species Environmental Assessment Guideline"* (South African National Biodiversity Institute, 2020. Species Environmental Assessment Guideline. Guidelines for the implementation of the Terrestrial Fauna and Terrestrial Flora Species Protocols for environmental impact assessments in South Africa. South African National Biodiversity Institute, Pretoria). Non-compliance with the *Species Environmental Assessment Guideline* has resulted in the following deficiencies:
    14.1. Insufficient time was allocated to surveying in the appropriate season (only 4 days for both Sheepmoor and Emvelo WEF sites, as well as the Grid sites).
    14.2. The classification of the Montane Grassland on site as "moderate sensitivity" in the absence of applying all relevant criteria, including *inter alia*, conservation importance, functional integrity, receptor resilience, as well as species of conservation concern, spatial priorities, intact grassland patches, and CBAs.
    14.1. The montane ridge (where WTGs 26, 27, 28, 29, 30 and 33, along with grid infrastructure are proposed), which also coincides with intact grassland and the highest sensitivity for Fauna (according to the Faunal Assessment), being classified as "moderate sensitivity". (Noting further that according to the Fauna Assessment, "the high sensitive escarpment area is likely of general importance for a range of faunal groups, <u>representative of a large contiguous and ecologically intact area</u> <u>of mostly good-quality montane grassland</u>".
15. As a result of the deficiencies in the Terrestrial Assessment outlined above, we have low confidence in the associated impact analysis, and dispute the Specialist's "low" significance ratings.
16. While an Oribi Management Plan has been undertaken and included in this revised draft EIA (not in the initial draft EIA), it cannot be motivation to mitigate the potential impact on the species. The Oribi Management Plan clearly states that an "Oribi baseline assessment will be required to understand the current status of the subpopulation, including distribution and population estimates". The report further states that the "WEF layout needs to minimise number of turbines and infrastructure (including laydown)".
17. Cumulative Impact Assessment:
    17.1. In our comments dated 10 April 2025 on your original draft EIA, despite bringing another 5 approved and in-process WEFs (within a 35 km radius) to your attention (i.e. Zephyr, Ujekamanzi Ntabande and Daggafoort and Emvelo), your revised cumulative impact assessment once again fails to mention or assess these. Subsequently, there are now an additional 3 WEFs within 35 km that are now in-process, i.e. Leghoya WEF 1, 2 & 3, and another one (1) within a 55 km radius (i.e. Anemoi WEF).
    17.2. Furthermore, although section 4.3.3 states that "the scope of this assessment will include all operational, approved or current <u>and planned</u> renewable energy applications", in addition to the approved or in-process WEFs identified in 17.1. above (not included in this assessment), there are actually an additional two (2) WEFs within 35 km and a further two (2) proposed WEFs (i.e. Pre-Application) within a 55 km radius, that have not been identified. The total number of turbines within 35 km is more than double that indicated in both the Draft EIA and Revised Draft EIA reports, i.e. 435 (and not 192) and within a 55 km radius there are more than 663 turbines (approved, in-process and

proposed). As a minimum, the cumulative impact of approved and in-process applications must be assessed.

17.3. The potential cumulative impact on avifauna, as indicated in our comments dated 10 April 2025, is now therefore likely to be even more substantial, due to the increased number of proposed turbines in the surrounding landscape. Of particular concern is the potential cumulative impact on Martial Eagles and Cape Vultures. The BirdLife South Africa Occasional Report Series 3: Summary of Bird Monitoring Reports from Operational Wind Energy Facilities in South Africa (February 2025), indicates that at current fatality rates due to collisions with wind turbines, "fatalities of Martial Eagles may already be exceeding the Potential Biological Removal (PBR) rate". Furthermore, "if current fatality rates at operational wind farms continue, at least 37 Cape Vultures could be lost to turbine collisions annually, representing a significant portion of the PBR. This figure is most probably an underestimate" (see limitations in the report) "and does not account for the anticipated acceleration of wind energy development. Unless other human-induced threats, such as powerline electrocutions and collisions, and poisoning, are urgently addressed, the population may not be able to withstand the added impact of turbine collisions."

17.4. Further to our comments dated 10 April 2025 and considering the additional WEFs in the surrounding landscape, we are now even more concerned about the cumulative impacts of these facilities on Oribi habitat, as expressed in the faunal assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area".

17.5. DFFE also requires that "the cumulative impact assessment for all identified and assessed impacts must indicate the following: (a) Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e. hectares of cumulatively transformed land". The Revised EIA Report does again not accurately quantify the size of the identified impacts, i.e. hectares of cumulatively transformed land. The overall footprint size of this, and all other similar proposed and approved renewable energy facilities within a 35 km radius is now 178 017.24 ha (Approved: 31 440.17 ha, In Progress: 89 247.96 ha, Pre-Application: 57 329.11 ha). Again, as a minimum, the cumulative impact of approved and in-process applications must be assessed.

17.6. As there has been no amendment in the revised EIA Report to the number of facilities identified surrounding this proposed facility, or a comprehensive comparative cumulative assessment undertaken, our previous comments on this matter dated 10 April 2025 remain unchanged, i.e. the cumulative impact assessment undertaken as part of this EIA does not adequately assess the cumulative impacts of this proposed facility, in relation to current and future similar renewable development facilities in the surrounding area.

18. Environmental Management Programme:

18.1. Our concerns related to the EMPr raised previously, still remain. The EMPr is unclear and vague, ambiguous, and does not provide adequate mitigation measures, timeframes, roles, responsibilities and reporting to adequately mitigate the potential impacts of this facility.

18.2. Given that we do not agree with the impact analyses undertaken in the EIA, the measures included in the EMPr as mitigation are, similarly, disputed.

18.3. The EMPr does not include a specific, measurable and timebound framework for decision-making regarding the duration of monitoring, and the specific circumstances for extension or curtailment.

18.4. The EMPr must be clear on when additional research is required.

18.5. Landowners must understand all access requirements and impacts associated with monitoring *throughout the lifespan of a project.*

18.6. Lease agreements must ensure that the effectiveness of monitoring is not compromised, and that restrictions do not compromise monitoring requirements in any way.

19. Biodiversity Offset Strategy:

19.1. According to the Biodiversity Offset Guideline, "*The desired outcome of biodiversity offsets is to ensure that - the cumulative impact of an authorised activity, or activities, and land and resource use change does not: result in the loss of irreplaceable biodiversity or jeopardise the ability to meet biodiversity targets; lead to any ecosystem with a threat status of Vulnerable or Least Concern becoming Endangered; or any Endangered ecosystem becoming Critically Endangered; or cause an irreversible decline in the conservation status of species and the presence of special habitats; or cause a significant loss in ecosystem services*". A biodiversity offset cannot therefore cater for the loss of Irreplaceable CBAs or intact grasslands. As detailed in the comments above, intact grasslands are crucial for supporting threatened fauna and avifauna.

19.2. The Biodiversity Offset Guideline specifically states that "biodiversity offsets are not appropriate when an activity, or activities, will have residual impacts on biodiversity of very high significance, including when residual negative impacts will result in loss of irreplaceable biodiversity".

19.3. In addition to Irreplaceable CBAs, the Biodiversity Offset Guideline also categorises the following as "irreplaceable biodiversity": Biodiversity of major potential concern, where residual impacts in this category could lead to – loss of vulnerable or potentially irreplaceable biodiversity in areas of recognised importance, such as – areas evaluated as having High Ecological Site Importance. We maintain that the correct and required implementation of the Species Environmental Assessment Guideline would have resulted in the Montane Grassland being classified as having High Ecological Site Importance.

19.4. The Intact Grassland Patches on the site must therefore be avoided, and cannot be offset. The requirement to consider biodiversity offsets is applicable only once it has been demonstrated that all measures of avoidance have been exhausted. The loss of irreplaceable biodiversity cannot be offset, and, as outlined above, "irreplaceable biodiversity" includes, key ecological corridors recognized as important for evolutionary processes and climate change adaptation where no options to safeguard these processes exist.

19.5. Furthermore, the Biodiversity Offset Report does not meet the following minimum requirements:

i. A portfolio of candidate biodiversity offset sites, including the likelihood of each site's availability and feasibility.

ii. The required biodiversity outcomes on each of the candidate biodiversity offset sites.

20. Public Participation:

20.1. In paragraph 9.3.3, it is stated that a "A comprehensive record of all comments received to date along with detailed responses from the Environmental Assessment Practitioner (EAP), specialists, and the project applicant is presented in the Comments and Responses Report (Volume II). For transparency and ease of reference, the original comments and corresponding responses are also appended to this volume". In your Public Participation Report (Volume III), it states that "During the DEIAR PPP comments were received from I&AP's. Follow-up e-mails were sent to all registered I&APs, stakeholders and authorities, and comments were received. Responses to comments received during the PP period are provided in Section 7, Table 7.1 below, with EAP / specialist / applicant responses, and the original comment and responses has been appended to the PP report which will be submitted with the FSR for DFFE decision".

20.2. However, in the copies of Emails included in the Public Participation Report, comments were submitted to you on 4, 9 and 10 April 2025 by: Megan Kim Govender; Adelma Vorster (Retsrov Boerdery) and Celine Oats (Richard Summers Inc.). *These comments have not been incorporated in your Comments and Response Report, nor have copies of the comments been appended to the Public Participation Report.*

20.3. Furthermore, a copy of the comments submitted to you by MTPA on 10 April 2025 have not been appended to the Public Participation Report, and have not been captured correctly in the Comments and Response Report (refer specifically to the list of flagged turbines).

Based on what has been outlined above, at least 17 of the 25 turbines proposed are located in unsuitable areas. In light of this, and in conjunction with the location of associated roads, OHLs and cabling in CBAs and avifauna and fauna high sensitivity areas, DARDLEA cannot support the application in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

EXTERNAL MESSAGE

Dear Lucien

Thank you for the opportunity to review the additional information. While we have not have the capacity to review the revised application in-depth, it is apparent that that many of our previously raised concerns and recommendations have not been addressed. Our previous comments dated 10 April 2025, and our objection to the proposed developments, therefore remain applicable.

We would also like to draw your attention the recently published guidelines for Special Species 23, available at the following link. We are concerned that the application is not aligned with these guidelines, which have been endorsed by the DFFE. Please consider those guidelines as additional comment on the applications.

Yours sincerely

Sam

Dear Interested and Affected Party,

Please note that the public comment period for the Draft Environmental Impact Assessment (EIA) Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities has been extended by one day, due to the public holiday on 9 August 2025.

The revised comment period now ends on 15 August 2025.

All other details remain unchanged. We encourage you to submit your comments by the new deadline should you wish to have your input considered in the Final EIA Report.

Thank you for your continued participation.

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Dear Albert,

We've received formal comment from BirdLife SA on the Draft EIA Report. Their submission raises concern regarding alignment with the recently published BirdLife SA Guidelines for Surveying and Mitigating Impacts on White-winged Flufftail.

Given that these guidelines were released in 2025, after the EIA process for this project commenced, we would appreciate your confirmation on whether they were considered in the preparation of your Final Avifaunal Specialist Report.

If not, please let us know, along with any relevant context or justification, so that we can respond transparently to BirdLife's concerns in the Final EIA submission.

Happy to take a call to discuss

Regards!

EXTERNAL MESSAGE

Dear Lucien

Just want to get the records straight without getting into an informal debate

1 - 4 : Correspondence

- Request info from ERM, Mr Lucien Barbeau, on 17/12/2024 at 11h04.
  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.
  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35
  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?
  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.
  Meeting took place on 4/08/2025.
  Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.
  Repeat request during meeting of 4/08/2025
  Received info only on 12/08/2025
  Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59
  Repeat request for tagged data from ERM on 29/03/2025 at 11h44
  Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.
  Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.
  Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct
The issue is not who did wrong but is the tagging done with a valid permit.?
If not, then it is illegal and that also implies for the data obtained by the unlawful act.
What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?
Very dangerous and controversial approach..
We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

>
> We are in the process of finalising the meeting minutes, which will be shared with you before the end of this week. Thank you
>
> **1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?**
>
> MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs, and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.
>
> ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.
>
> **2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?**
>
> ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.

While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.

We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise

unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case. Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives, identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

Dear Mr. Meyer,

Good day, and thank you for your recent correspondence regarding the Draft EIA Reports.

We acknowledge your request for a meeting to discuss the concerns raised. In consultation with the applicant, Mulilo, we are proposing a provisional date of Wednesday, 7 August 2025, with the meeting to be held at a venue in Ermelo. Kindly confirm whether this date is suitable for you and whether you will be attending alone or accompanied by others.

As a registered I&AP, your comments form an important part of the formal public participation process and will be incorporated into the Final EIA Reports. We also acknowledge the concerns raised regarding the tagging of the Martial Eagles. Relevant documentation, including permits, will be made available where appropriate to support transparency and clarity during the engagement.

We look forward to your response.

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

>
> Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Dear Albert,

We've received formal comment from BirdLife SA on the Draft EIA Report. Their submission raises concern regarding alignment with the recently published BirdLife SA Guidelines for Surveying and Mitigating Impacts on White-winged Flufftail.

Given that these guidelines were released in 2025, after the EIA process for this project commenced, we would appreciate your confirmation on whether they were considered in the preparation of your Final Avifaunal Specialist Report.

If not, please let us know, along with any relevant context or justification, so that we can respond transparently to BirdLife's concerns in the Final EIA submission.

Happy to take a call to discuss

Regards!

EXTERNAL MESSAGE

Dear Lucien

Thank you for the opportunity to review the additional information. While we have not have the capacity to review the revised application in-depth, it is apparent that that many of our previously raised concerns and recommendations have not been addressed. Our previous comments dated 10 April 2025, and our objection to the proposed developments, therefore remain applicable.

We would also like to draw your attention the recently published guidelines for Special Species 23, available at the following link. We are concerned that the application is not aligned with these guidelines, which have been endorsed by the DFFE. Please consider those guidelines as additional comment on the applications.

Yours sincerely

Sam

Subject: FW: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province
Dear Interested and Affected Party,

Please note that the public comment period for the Draft Environmental Impact Assessment (EIA) Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities has been extended by one day, due to the public holiday on 9 August 2025.

The revised comment period now ends on 15 August 2025.

All other details remain unchanged. We encourage you to submit your comments by the new deadline should you wish to have your input considered in the Final EIA Report.

Thank you for your continued participation.

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Dear Ms Gopaul,

RE: Draft Environmental Impact Assessment Report: Proposed Emvelo Wind Energy Facility and Auxiliary Infrastructure, Mpumalanga (Reference: 14/12/16/3/3/2/2611)

AND

Draft Environmental Impact Assessment Report Proposed Sheepmoor Wind Energy Facility and Auxiliary Infrastructure, Mpumalanga (Reference: 0684401**)**

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (EIA) Report for the proposed Emvelo and Sheepmoor Wind Energy Facilities and associated infrastructure. While BirdLife South Africa supports the development of wind energy, we firmly believe it should not come at the expense of biodiversity. We have significant concerns regarding both the adequacy of the EIA sand the potential impacts of the proposed developments on the receiving environment, which we summarise below.

Receiving Environment

1. The proposed developments overlaps with critical habitats, including Intact Grassland Patches, Critical Biodiversity Areas (CBAs), Climate Change Corridors, National Protected Area Expansion Strategy (NPAES) areas, and Key Biodiversity Areas (KBAs), wetlands and the escarpment (the latter is used by birds for altitudinal and north-south migrations). The area supports numerous species of conservation concern, including bird that are at risk of direct fatalities (e.g., collisions and electrocutions), habitat loss, and disturbance. We are therefore concerned that this site is not suitable for wind turbine and associated infrastructure.

Avifaunal Impact Assessment – Data Collection

2. The duration and scope of data collection for the avifaunal assessments appear inadequate given the sensitivity of the habitats and the spices they support. BirdLife South Africa and the Endangered Wildlife Trust (EWT)'s Best Practice Guidelines and our Cape

Vulture guidelines recommend increased survey effort in areas of high avifaunal sensitivity. The sites have been confirmed as such by the avifaunal specialist.

3. While the location of vantage points is provided, there is no indication of view-sheds, and it is unclear what proportion of turbines were covered by vantage point surveys.

Cumulative Impacts

4. Limiting cumulative assessment to a 35 km radius is inappropriate for wide-ranging species - i.e. most birds. A more ecologically relevant approach is needed

Species 23 (Critically Endangered)

5. We are concerned about potential degradation of wetlands associated with the developments, including habitat for Critically Endangered Species 23. We are particularly concerned where MV cabling is proposed to traverse a wetland (marked as a no-go area). It is unclear whether the cable will be buried or above ground; neither option is supported due to collision risk (above ground) and habitat degradation (below ground).
6. We acknowledge the thought and analysis that went into developing the proposed mitigation strategy for Species 23 but are concerned that the proposed avoidance and mitigation measures are **not sufficiently precautionary**.
7. In light of the to the limited data on the species of its movement patterns and collision risk, **we do not support the location of turbines in any of the medium sensitivity areas identified for the species in the avifaunal assessment**.
8. Additional comments on the proposed curtailment strategy are detailed below.

Martial Eagle (Endangered)

9. The avifaunal assessment uses various data sources to predict how Martial Eagles use the area, but the basis for the final buffer recommendations is unclear. For example, a 2.5 km no-development buffer is recommended, despite the report's own vantage point surveys suggesting 3 km may be more appropriate.
10. Tracking data from a single adult and one juvenile was used to model habitat use and define high and medium sensitivity zones (turbine collision). However, as far as we can ascertain, the model was based on less than a year's worth of data and does not account for interannual variation, seasonal use, alternative nest sites, or sex-based behavioural differences. Furthermore, the criteria used to define high, medium, and low/no sensitivity areas are not transparent. It is also unclear whether other relevant data (e.g., territory size and tracking data from other studies) were considered and how this influenced the recommendation.
11. While we support refining circular buffers with **more robust**, site-specific data, we are concerned that the proposed buffer is significantly smaller than the 5–6 km buffer recommended by BirdLife South Africa and EWT. Although available studies in this regard are limited, this buffer is based on the best available data on territory size.

Southern Bald Ibis (Vulnerable)

12. A shaped turbine exclusion zone was delineated in the avifaunal reports, based on modelled flight activity for Southern Bald Ibis. Again, we request clarity on how the

thresholds for the sensitivity zones (i.e. between high, medium, and low/no sensitivity) were defined.

Cape Vulture (Endangered)

13. We are concerned that the impact assessments underestimates the risk of Cape Vulture fatalities. Our recent review of operational monitoring reports (BirdLife South Africa 2025) shows that vulture collisions occurred even at sites where the species was rarely or never recorded during monitoring surveys. We are therefore of the opinion that the recorded observation of one vulture a week is sufficient to warrant the implementation of shutdown-on-demand (SDoD) for **all** proposed turbines.

Yellow-breasted Pipit (Vulnerable)

14. Turbines and roads have been proposed within Yellow-breasted Pipit habitat, contrary to the avifaunal specialist's recommendations. We do not support this.
15. We also suggest that there should be greater commitment to avoid and conserve the remaining habitat of this species.

Other Species at Risk

16. The ecological importance of intact grassland patches for birds (e.g. Endangered Secretarybird) is not sufficiently acknowledged in the assessment.
17. At least 32 priority bird species were recorded in the project area of influence, and more within the powerline corridor. However, sensitivity maps were only produced for a few of these species. It appears that the assumption is that the overlap in mitigation/avoidance zones for the handful of key species will cover the others. However, this is not made explicit and may give the false impression that only the mapped species are at risk.
18. Similarly, collision risk modelling was only conducted for a few species, likely due to limited data (see above regarding concerns about data limitations).

Avoidance and Layout Alternatives

19. Although avifaunal and faunal specialists made explicit recommendations for avoiding sensitive areas, these do not appear to have influenced the "preferred" development layouts. These recommendations are reflected in the EIA reports and EMPrs and they seem to influence the "post mitigation" significance ratings presented in the reports. This creates ambiguous and potentially misleading assessments – it is unclear what exactly is being proposed and what has been assessed.
20. It is also unclear on what basis the "preferred" layouts were been selected. Is it the applicant's opinion, or ERM's?
21. Table 5-1 of the EIR contains misleading claims with regards to the site and overlap with sensitive areas. For example, it states: "*There are no specific features of very high biodiversity value within the affected polygons and highly sensitive areas have been avoided for development. In addition, the site does not appear to fall on any significant gradients or corridors that are likely to be of high importance for biodiversity processes such as migration and faunal movement*". This contradicts the avifaunal assessment.

22. We strongly recommend that layout alternatives (e.g. the applicant's preferred alternative and one that implements the biodiversity specialists' recommendations for avoidance) are more transparently assessed.
23. If turbine relocations are not implemented in a layout, this should not influence the assessment of impact significance.

Mitigation Against Bird Strikes – Shutdown on Demand (SDoD)

24. SDoD is recommended for medium sensitivity areas, yet the (applicants')"preferred" alternative includes turbines within high sensitivity zones. If such turbines are approved (**which we do not support**), SDoD should be extended to those areas as well.
25. Several species recorded on site were not mapped for sensitivity but are likely to be at risk of collisions (e.g. Secretarybird and Cape Vulture). SDoD should therefore be applied to all turbines.
26. The EIA and EMPrs suggest either observer-led **or** automated (radar **or** camera) SDoD should be implemented - implying that just one of these approaches will be adequate. However, a combination of approaches, tailored to the behaviour of all priority species at risk may be required. For example, radar would benefit large night-flying species (e.g., flamingos, owls) and those that fly in misty conditions, while camera-assisted SDOD is more suited for large soaring birds (e.g., eagles) that move during the day. Observer-led SDOD on would benefit species that spend time on the ground (e.g., Secretarybird and Southern Bald Ibis), that, when they do fly, may not be detected by technology in time to shut turbines down.
27. In light of the above, we suggest that more detail is needed with regards to required approach to SDOD, including the spatial and temporal coverage, trigger species, and operational protocols for implementation.

Mitigation – Curtailment

28. With regards to reducing collision risk for Species 23 (which is too small to benefit from SDoD), the proposal to curtail operations at night based on habitat suitability monitoring **does not offer adequate protection**.
29. Movements likely occur between wetlands as conditions change—often faster than the proposed 7–14-day monitoring interval, and while it is commonly assumed that the species only moves at night, there is no data to verify this assumption yet.
30. We are further concerned that much simpler operational phase mitigation measures have failed at wind farms elsewhere in South Africa. The complexities and expertise required for this "smart" curtailment presents a risk of poor implementation and an inability of officials to ensure and, if necessary, enforce compliance.
31. Given our limited understanding of this species' movement patterns and risk of collisions we do not support turbines in any medium sensitivity areas identified for this species. Alternatively, we suggest that a risk averse, precautionary approach would be full seasonal curtailment of turbines in medium risk areas during summer.

Mitigation – Other Measures

32. The EIAa and EMPr mention adaptive management strategies should be implemented if fatality thresholds are exceeded. However, no such thresholds are defined.

Isdell House, 17 Hume Road

Email: info@birdlife.org.za
www.birdlife.org.za

Honorary Patrons: Mrs Gaynor Rupert, Dr Precious Moloi-Motsepe, Mr Mark Shuttleworth, Mrs Pamela Isdell

33. In the absence of robust figures, we recommend a zero-fatality target for threatened and demographically sensitive species. Exceeding this should trigger further mitigation if available data suggests that further fatalities of the affected species are likely over the lifespan of the facility.
34. We are exceptionally concerned that there are currently **no proven, additional mitigation** options beyond curtailment, or stopping turbines entirely. This would have significant cost implications for the operator. This open ended recommendation introduces a significant degree of risk and uncertainly for the applicant, as well as biodiversity. There should be clear parameters defined and budget set aside accordingly.

Stewardship, Offsets, and Landowner Agreements

35. While we support recommendations for proactive conservation contained in the EIA (e.g., stewardship, alien clearing and offsets), we are concerned about feasibility of this if the applicant is not the landowner. We suggest that these recommendations and landowner agreements should carefully considered to ensure recommendations and commitments in this regard are implementable.
36. As a **condition of approval** (should this be granted), the applicant must secure landowner agreements for all required mitigation and monitoring (e.g., carcass searches, SDoD) before construction begins.

Operational Phase Monitoring

37. Given the site's sensitivity and risk to birds species of conservation concern, monitoring requitements should be more detailed and species-specific. For example:
    a. Carcass surveys should be tailored to detect fatalities for Species 23 and other small species (e.g., Yellow-breasted Pipit) in addition to large birds,
    b. Surveys should be designed to detect displacement, disturbance, and habitat alteration for priority species.
    c. Carcass surveys must continue for the facility's lifespan to evaluate SDoD and curtailment effectiveness.

Construction Phase EMPr

38. As discussed above, the construction phase EMPr is not aligned with the preferred layout (i.e. it recommends avoidance of areas where roads, turbines and cables have been proposed). Clarification is needed on how this will be resolved.

Operational Phase EMPr

39. The operational EMPr should be revised to include specific, time-bound, and measurable impact management **outcomes**, clearly defined triggers for additional action and response timeframes.
40. Fatality thresholds must be clearly defined to avoid ambiguity.
41. We suggest that the operational EMPr, specifically the mitigation **actions** included in the avifaunal management plan should be **reviewed** at least every five years. Stakeholders should be provided an opportunity to provide input into any changes.

Isdell House, 17 Hume Road
Dunkeld West, Gauteng 2196
Private Bag X16, Pinegowrie
2123, South Africa
[redacted]
Email: info@birdlife.org.za
www.birdlife.org.za

Honorary Patrons: Mrs Gaynor Rupert, Dr Precious Moloi-Motsepe, Mr Mark Shuttleworth, Mrs Pamela Isdell

42. Operational phase EMPr compliance, including avifaunal management plan, should be **audited annually**.
43. All avifaunal monitoring and audit reports should be made publicly available and shared with BirdLife South Africa.

Conditions of authorisation

44. We are concerned that the proposed conditions of authorization relating to impacts on bird are weak, particularly with regard to monitoring and mitigating operational phase impacts. While the EMPrs play an important role, many requirements can be lost in the detail of these vast documents. Critical recommendations should be highlighted in the EA, and detailed in the EMPr.

Conclusion and Next Steps

BirdLife South Africa does not support the proposed developments in their current formant. We have significant concerns about that suitability of the area of wind farm development, and suggest that the impact assessment, layout and mitigation strategies need to be substantially strengthened and updated before the development could be considered for approval (if at all). Due to time constraints, BirdLife South Africa has not reviewed the EIA report in as much detail as we would prefer. We may have missed some issues and reserve the right to raise further concerns and questions. We also recommend that the EIAs be subjected to an independent peer review as part of the revision process.

Please do not hesitate to contact us should you require any further clarification.

Yours sincerely,

Sammantha Ralston-Paton

Good day Mr Meyer,

Thank you for your email and your responses. We acknowledge receipt of your comments and confirm that they will be incorporated into the Comments and Responses Report for the proposed development.

A formal response to your comments will be provided within that report, which will form part of the Final EIA submission to the DFFE.

Kind Regards,

ERM

EXTERNAL MESSAGE

Dear Lucien

Just want to get the records straight without getting into an informal debate

1 - 4 : Correspondence

- Request info from ERM, Mr Lucien Barbeau, on 17/12/2024 at 11h04.
  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.
  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35
  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?
  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.
  Meeting took place on 4/08/2025.
  Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.
  Repeat request during meeting of 4/08/2025
  Received info only on 12/08/2025
  Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59
  Repeat request for tagged data from ERM on 29/03/2025 at 11h44
  Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.
  Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.
  Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct
The issue is not who did wrong but is the tagging done with a valid permit.?
If not, then it is illegal and that also implies for the data obtained by the unlawful act.
What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?
Very dangerous and controversial approach..
We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

>
> **1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?**
>
> MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs, and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.

ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.

While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.

We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes)

was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might

have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case. Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives, identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Kind regards,

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

EXTERNAL MESSAGE

Dear Lucien

Just want to get the records straight without getting into an informal debate

1 - 4 : Correspondence

- Request info from ERM, Mr Lucien Barbeau, on 17/12/2024 at 11h04.
  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.
  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35
  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?
  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.
  Meeting took place on 4/08/2025.
  Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.
  Repeat request during meeting of 4/08/2025
  Received info only on 12/08/2025
  Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59
  Repeat request for tagged data from ERM on 29/03/2025 at 11h44
  Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.
  Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.
  Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct
The issue is not who did wrong but is the tagging done with a valid permit.?
If not, then it is illegal and that also implies for the data obtained by the unlawful act.
What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?
Very dangerous and controversial approach..
We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

On Tue, Aug 12, 2025 at 12:08 PM ERM Arcus Amsterdam <ERM.ArcusAmsterdam@erm.com> wrote:

> Good day Mr Meyer,

Please find below our responses to your comments.

We are in the process of finalising the meeting minutes, which will be shared with you before the end of this week. Thank you

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs, and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.

ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.

While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.

We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes)

was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case. Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives,

identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

Dear Mr Meyer,

Thank you for your email and for taking the time to share your reflections following our meeting on Monday.

We acknowledge receipt of your comments and the additional questions you have raised. We appreciate your continued engagement in the process and will respond to your queries as soon as possible.

Should you have any further inputs in the meantime, please feel free to share them with us.

Kind Regards,

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.
  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35
  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?
  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.
  Meeting took place on 4/08/2025.
  Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.
  Repeat request during meeting of 4/08/2025
  Received info only on 12/08/2025
  Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59
  Repeat request for tagged data from ERM on 29/03/2025 at 11h44
  Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.
  Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.
  Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct
The issue is not who did wrong but is the tagging done with a valid permit.?
If not, then it is illegal and that also implies for the data obtained by the unlawful act.
What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?
Very dangerous and controversial approach..

We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

>
> We are in the process of finalising the meeting minutes, which will be shared with you before the end of this week. Thank you
>
> **1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?**
>
> MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs, and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.
>
> ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.
>
> **2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?**
>
> ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.
>
> While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this

as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.

We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of

1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case. Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives, identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the

report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

> > Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

From: Josua Meyer (081 019 2213)

R/E : COMMENTS ON DRAFT EIA REPORT FOR PROPOSED SHEEPMOOR AND EMVELO WEF.

Attached are the comments on above mentioned WEF.

The comments were sent from POSTNET, Ermelo due to the lack of scanning facilities for the 17 appendixes.

Please confirm reception of it to my email meyerjosua55@gmail.com

Regards

COMMENTS ON THE MAY 2025 DRAFT EIA REPORT FOR SHEEPMOOR AND EMVELO WIND ENERGY FACILITIES, MPUMALANGA PROVINCE

Josua Meyer (081 019 2213) ***14/08/2025***

A – AVIFAUNAL

1. THE AVIFAUNAL SPECIALIST REPORT of MAY 2025 IS FATALLY FLAWED.

1.1 AfriAvian signed an **NDA (non-disclosure agreement)** with the applicant, Mulilo, concerning the tagged data of two martial eagles.

That is an undisputed CONFLICT OF INTERST?

Mr Lloyd Barnes of Mulilo also made the shocking confession in the meeting held on the farm Onverwacht on Monday, 4/08/2025 that he and AfriAvian **collective define** the shaped exclusion zones for the Southern Bald Ibis.

This puts AfriAvian integrity and credibility under supreme suspicion and is contradictory to the DECLARATION they signed as independent specialist.

1.2 An investigation of the validity on the fitting of the satellite tracking devices (tagging) to the two Martial Eagles were done by Mr Theo Mol, the ornithologist of MTPA.

Mr Moll conclusion was without a doubt that the project of the applicant, MULILO, in partnership with EWT, was done without valid permits and is therefore *illegal*, if not *criminal*.

Mulilo is in partnership with EWT to fit the satellite device on the Martial Eagle. They are therefore collectively accountable for their partner's misconduct irrespective who did it. Attempts to shift the blame cannot legalize the misconduct nor the tagged data obtained from the misconduct irrespective weather the data is useful information or not.

What aggravate the situation is that the tagged data was withheld from the I&AP and used selectively by AfriAvian.

AfriAvian used data in their May 2025 report of a Martial Eagle tagged near **Verkykerskop**. Due to the local misconduct, use of those data in AfriAvian report should be subject in providing a valid permit by the applicant under which that Martial Eagle was tagged there.

Therefore, the used of the illegal tagged data in the specialist reports is not permissible. Everything which made used or any reverence to the tagged data of the Martial Eagle must be remove from all the avifaunal assessment reports for Sheepmoor and Emvelo WEF

1.3 AfriAvian claimed that their **site surveys** were conducted over all four (4) seasons of the year.

The detail in their specialist report confirm that the site surveys were only conducted during eight (8) months of the year which exclude the four essential summer months from 21 October to 21 February. **(Appendix 1)**

The visit in January 2023 was only a drive through.

The five (5) additional surveys were only conducted close to the Martial Eagle breeding nest as confirmed in figure 19.

Their bird monitoring specialist, Mr Jason Boyce, conducts a further site survey on 16 / 17 December 2024. According to Mr Johans van Wyk from Mulilo the White-winged Flufftail was targeted.

Therefore, data compiled from the site surveys is fatally flawed and unsuitable to compile any shaped exclusion zones for the priority bird species, especially the Southern Bald Ibis.

1.4 AfriAvian added the following **highly disputable statement** to their May 2025 avifaunal report (Par 5.8 page 38)

> *'These additional surveys were done to cover the expanded WEF ..... during which time all other bird species were* also recorded ***across the entire project site during this time.***'

Why was this only revealed now and not in their reports of May 2024 and March 2025?

Where is the detail which was obtained of all the other bird species across the entire site during that time, recorded?

Why was this detail, if it exists at all, not separate documented as the detail in figure 19 where all other priority species flight paths obtained during the five (5) additional surveys near the Martial Eagle nest, documented?

If AfriAvian claiming that it was incorporated with previous site visits data then the question automatic arises way was the same not done with figure 19?

Again, AfriAvian always notified the landowners when they intend to do site surveys. No such notification was given during the additional five (5) surveys near the martial eagle's nest. The conclusion is obvious no notification was necessary because there were no such site surveys executed during that time. Those five additional surveys clearly targeted the martial eagle and concentrated around their breeding site from an observation point on the R65.

Recorded flight lines of all other priority species (excluding Martial Eagle) in figure 19 of both AfriAvian reports confirms that the additional five (5) surveys were only centralized around the martial eagle's nest. **(Appendix 2)**

Above contradict the claim from AfriAvian that surveys during the additional five (5) surveys were also done across the entire project site.

***The conclusion is that AfriAvian fraudulently forged this in reaction to the email dated 15/4/2025 where this misconduct was first brought under their attention. It is obvious the reason why this statement did not feature in their previous two reports, May 2024 and March 2025* (Appendix 3)**

1.5 AfriAvian also added the following **statement** to his May 2025 avifaunal report (Par 5.8 page 38)

'In addition, from December 2024 to February 2025 additional targeted wetland surveys were conducted ..... and again all other bird species were also recorded across the entire project site during this time.'

And again, why was this survey not mentioned in their previous avifaunal specialist report of March 2025?

And again, where are the detail flight paths of all the other bird species which were allege recorded across the entire project site during the site surveys from December 2024 to February 2025?

And again, why was this detail, if it exists at all, not separate shown as is the case with detail in figure 19?

And again, as landowners we received only one notification of a site survey during above mentioned period from AfriAvian bird monitoring specialist, Mr Jason Boyce. He mentioned that his site survey during 16/17 December 2024 targeted mainly the wetlands for the white-winged flufftail.

Nevertheless, if multiple wetland surveys were done during that period, then AfriAvian scandalous failed to allocate the active **Grey Crowned Crane** breeding nest. **(Appendix 4)** Even after they were informed of the active nest on 15/01/2025? **(Appendix 5)**

It appears to be another unethical attempt by AfriAvian to rectify the absence of their summer site surveys. In the meantime, they shamefully exposed their flawed site surveys.

1.6 The **aquatic turbine exclusion buffer zones** around the drainage lines and wetlands from the avifaunal perspective are deleted by AfriAvian in their May 2025 specialist report.

Motivation given by AfriAvian for such a drastic adjustment is highly disputable.

The scenario did not change since their March 2025 report because there was no substantial change in the May 2025 aquatic specialist report that justified it.

The March 2025 was supposed to be the final avifaunal report. It was the last opportunity for any adjustments and this should have been done in that report if necessary.

The additional three (3) months extension could not be foreseen.

The reason becomes obvious when the February 2025 (Figure 33) and May 2025 (Figure 31) reports are compared. **Mulilo had a problem and needs to obtain a restriction free corridor for their transmission line. (Appendix 6)**

The adjustment further justifies the four (4) proposed turbines on the farm Windhoek which were in narrow spaces between constrains. Specialist recommended that turbines should be excluded in narrow spaces < 500 m between constrains, no-go and high-risk areas, because birds and bats are free foragers with unpredictable flight behaviour.

This adjustment is therefore unethical, unprofessional, and highly controversial.

1.6 AfriAvian denied knowledge about the **tagging of a female martial eagle** when they were approached on 11 December 2024 **(Appendix 7)**

In the meantime, AfriAvian used that data selectively in their specialist's report but inexplicable neglected to inform us that it exists.

Not very transparent but highly suspicious behaviour of AfriAvian.

1.8 AfriAvian claimed in his March 2025 and May 2025 specialist report (Par 5.8.7.1) that

a **flight risk modelling** of the martial eagles tagged data was not conducted due to the limited number of birds and temporal span of the tagged data.

The same data seems to be sufficient to conduct sophisticated models for mitigation recommendation on the movement of the Martial Eagle?

Highly contradictory approach.

1.9 The recommended exclusion buffer for the **Martial Eagle** by AfriAvian is primary based on the **illegal obtained satellite data and cannot be used in both their May 2025 final reports.**

The only alternative is to return to the more proven circular buffers around breeding sites which are general accepted by most avifaunal specialists.

The Martial Eagle specialist of EWT, **dr Gareth Tate,** recommended a circular no-go buffer zone around a Martial Eagles nest of **six (6) km.**

Dr Andrew Jenkins of Avisence recommended the following buffer in his peer review report of 9 April 2025:

"Application of a larger protective buffer around the Martial Eagle nest (**of at least 6 km**) is the only, appropriately conservative way to mitigate impact risk in this instance, especially given that the report acknowledge that the tracked eagle spent 21% of the recorded flight time > 6 km away from the nest site."

The avifaunal specialist **Dr Low de Vries** from Volant applied a buffer zone of **five (5) km** around the Martial Eagle nest on the Daggafoort WEF. **(Appendix 8)**

Ironically, **AfriAvian** themselves applied a **five (5) km** buffer zone around the Martial Eagle nest in their avifaunal specialist report for the Phefumula Emoyeni One WEF. **(Appendix 9)**

The **satellite flight data** of the two eagles was unjustified withheld from the I&AP's by Mulilo. **(Appendix 15)** This data was selective used by AfriAvian in his reports to conduct no-go zones. These buffers and collusion risk modelling depends highly on several unproven assumptions.

The same data of the tagged eagles were eventually obtained through MTPA. The hourly daytime positions of the female martial eagle (1372) were plotted and gave a clear indication where the female eagle moved during the 14-month period. ***(Appendix 10)*** It reveals clearly that recommended buffers of AfriAvian is inadequate and that was the predominant reason while Mulilo refused to reveal the data to the I&APs.

The flight data obtained from the tagged female martial eagle clearly indicates that the shaped no-go zone calculate by AfriAvian is totally inadequate and absurd. According to the tagged data a no-go zone of ten (10) km radius will be more appropriate to secure the survival of the two Martial Eagles

1.10 On the 15 January 2025 an active breeding nest of a **Grey Crowned Crane** was reported to AfriAvian. **(Appendix 5)**

Although it is an endangered bird species the reported breeding nest, in the middle of a natural pan, was not investigated nor recorded by AfriAvian in their report of March 2025 and May 2025.

AfriAvian also failed to allocate this breeding site during their claimed wetland site surveys in December 2024 to February 2025. A clear example of their defective site surveys.

AfriAvian applied a two (2) km buffer around similar natural pans in their avifaunal report for the Phefumula Emoyeni One WEF project. **(Appendix 9)**

Dr Low de Vries of Volant recommended a circular no-go zone of three (3) km around a Wattle Crane nest and a 1 km turbine exclusion zone around the Grey Crown Crane **(Appendix 8)**

Therefore, a circular no-go buffer of 2 km is more appropriate around the breeding site of the Grey Crowned Crane because wetland buffer alone not big enough. (Appendix 13)

1.11 AfriAvian failed to allocate a breeding site of the **Southern Bald Ibis** colony on the Windhoek farm (Previous Sheepmoor WEF 3) during their first site surveys.

This breeding site was pointed out to AfriAvian bird monitoring specialist during their first site surveys but they failed to confirm it. Another proof of their defective site surveys.

Ironically, AfriAvian recorded this breeding colony in their Leghowa 3 WEF avifaunal specialist report of May 2025 for RedCap **(Appendix 11).**

AfriAvian make used of the opportunity to adjust several controversial details in their May 2025 report, this important location of another Southern Bald Ibis colony site was inexplicable not added?

AfriAvian applied a 2,5 km circular buffer around the Southern Bald Ibis breeding colonies in their avifaunal report for the Phefumula Emoyeni One WEF project. **(Appendix 9)**

AfriAvian also originally recommend a 2,5 km circular exclusion zone around the two Southern Bald Ibis colonies, FP2 and FP3, in the Sheepmoor and Emvelo WEF's. **(Appendix 12)**

Mr Lloyd Barnes of Mulilo and AfriAvian apparently collectively define afterwards the current shaped buffers. They also rely strongly on the flawed site survey data which excluded the four (4) summer months of the year. **These two actions are not acceptable.**

***Therefore, the shaped exclusion zones are unacceptable and a circular buffer of 2,5 km as originally applied by AfriAvian must be reinstated around all three (3) Southern Bold Ibis colonies sites.* (Appendix 13)**

1.12 AfriAvian failed to allocate a **Secretarybird** breeding nest on the farm Klipfontein as pointed out to them by Mr Pikkie Vorster. Although the nest might not have been active during their site visits, it was clearly identified in photo presented by Mr Vorster and should have been recorded.

The thorn three where the nest is located was unfortunately damaged by a runaway veldfire in October 2024. The tree has fortunate recovered and hopefully will be used again as a breeding site because still moved around in the area.

AfriAvian recommend a one (1) km turbine exclusion zone around the Secretary bird nest in their Leghoya WEF scoping report which is totally inadequate.

The avifaunal specialist **Dr Low de Vries** from Volant applied a buffer zone of two (2) km around the Secretary bird nest in his Daggafoort WEF specialist report. **(Appendix 8)**

Therefore, a 2 km turbine exclusion zone is more appropriate buffer around the Secretary bird nesting site (Appendix 13)

1.13 Above put the integrity, credibility, and independence of the AfriAvian report under severe suspicion and recommendations for turbine exclusion zones around priority bird species in their reports should be rejected and replaced by circular buffers as applied by other specialists. (Appendix 13)

- ***Martial Eagle = 5 km circular buffer*** *(APPENDIX 8 / 9)*
- ***Grey Crowned Crane = 2 km circular buffer*** *(APPENDIX 9)*
- ***Southern Bald Ibis = 2,5 km circular buffer*** *(APPENDIX 8 / 9)*
- ***Secretary bird = 2 km circular buffer*** *(APPENDIX 8 / 9)*

2. Ridgeline buffers

Steep rocky ridgelines spread across the entire escarpment where the Sheepmoor WEF and

Emvelo WEF are located. According Dr Low de Vries of Volant Environmental those ridgelines serve as sensitive habitat for avifaunal for the following reasons

2.1 Great perching sites for raptors to use as vantage point when searching for prey

2.2 Flyways for raptors and large priority species which use the thermals created by the change in topography to move around.

2.3 Nesting and roosting sites.

This is proven by the currently three (3) active nesting sites of the Southern Bald Ibis, the nesting and roosting site of the Martial Eagle located around the steep ridgelines. **(Appendix 14)**

The bat specialist also calls for a 200m no-go buffer around rocky outcrops in Table 8 of his report as is the case on majority ridgelines.

Dr Low de Vries of Volant Environmental applied in his avifaunal report for Ntabande WEF a 390m turbine free buffer around those ridgelines. Similar ridgelines occur in the Emvelo and Sheepmoor proposed WEF's and the same practice should be applied to protect the avifaunal.

3. Remotely triggered turbine curtailment and observer-based Shutdown on Demand (SDoD) short falls.

All the turbines must be provided with remote radar curtailment if application is succeeded. Manually SDoD will be inefficiently on its own because

3.1.1 most of the turbines is in remote and difficult accessible areas. It will be challenging to transport the people every day in time to all the turbines. The liability of the human factor playing on their cell phones or sleeping is also a reality

3.1.2 the movement of people to the turbines will increase human traffic as well as criminal activities and is not advisable with respect to the ground nesting species.

3.1.3 the fog on the escarpment becomes very dense with limited sight.

3.1.4 The visibility is during thunderstorms also limited

The turbine radar curtailment must be proven as effective and WTG must be equipped and tested before the rotor starts turning.

There is no clear indication which turbines will be fitted with radar SDoD.

All electronic devices are in danger to be damage by lightning because the WEF will be in a high intensity lightning zone. It runs the risk to be ineffective and must be tested in short intervals with enough stock as backup.

There are no official studies or report that confirms the effectiveness of above measures and devices with the enfaces on the effected priority species within this project.

Most species tend to cover more distance in flight then the time the turbine rotor takes to stop. (The southern bold ibis fly between forage and roosting sites at speed of 40-50 km/hr)

4. Mitigation short falls

4.1 **The principal that preventative considerations should always be consider before mitigation measures are implemented. (Gove et al. 2013)**

4.2 Turbines should be excluded in **narrow spaces < 500m between constrains**, no-go and high-risk areas, because birds are free foragers with unpredictable flight behaviour.

4.3 Mitigation measures recommended by AfriAvian is not proven and based on **computer models** with several assumptions without accredited field test conducted to guarantee effectiveness.

4.4 Martial Eagle mitigation models and recommendations must be removed from report because the data used it is illegal obtained.

4.5 As pointed out by AfriAvian in their avifaunal report that **bigger bird (cranes, bald head ibis etc.) with high wing loading** is less manoeuvrable in flight and will be in danger to collide even with non-rotating turbines and powerlines.

4.6 AfriAvian also confirmed in their avifaunal report that some birds (cranes, ex) have **better sight in the lateral field of view** than frontal which increase the risk of collusion even with the non-rotating turbine and powerlines.

4.7 The monitoring of birds been killed by the turbine as included in the BMP and mitigation recommendations are not reliable and **distorted figures are recorded**. According to me. Kate Webster of Vulpro, the reporting of bird deaths caused by turbines are covered up by rewarding farm workers for removing carcasses to decrease the numbers found. **Mulilo already made them guilty to similar practices by not reporting the shooting of the juvenile martial eagle and signing NDA with avifaunal specialist.**

B - GAMEFARM

We are in progress expanding our existing commercial hunting partnership with Lloyd Safaris.

Our target is the international market for commercial hunting which has big potential for expansion and created good revenue with permanent jobs.

We are busy establishing a game farm on our farm Waaihoek (P3, P4 and P12)

International hunters have become very sensitive for windfarms and any visible wind turbine will have a negative effect on our investment.

The following proposed turbines **40,41,42,43,44,45,46,50,51,52 and 53** are not acceptable due to the visual pollution.

Due to the game farm in progress no additional transmission line can be allowed over the applicable properties.

The existing farm workers house insite the proposed game farm is in the process to be moved to site XX on plan. **(Appendix 17).**

The following proposed wind **turbines, 41,42 and 43,** is therefore not acceptable due to shadow flickering and noise pollution. The **proposed substation behind turbine 42** is also not acceptable due to the potential noise.

C - DWELLING at WATERFALL

The future generation has earmarked the development of eco cabins next to the waterfall on farm Waaihoek P14. **(Appendix 16)**

Any visible wind turbine will pollute the unique scenery and damage the sense of place. There will be at least 9 proposed turbines visible which shall pollute both day and night scenery. All that proposed turbine's locations must be investigated and address accordingly for visual and noise pollution.

There is already an existing dwelling at the waterfall and proposed turbines will coarse unaccepted pollution. The following proposed turbines, 41, 42 and 43, are unacceptable due to flicker shadow and noise at the dwelling as indicated by the Visual and Noise specialist reports. **Effected proposed turbines which need to be relocated are 41,42 and 43.**

As indicated in figure 10-3 of the Visual Impact Report by Mulilo's specialist proposed **turbines 31 and 32** will courses unacceptable shadow flickering on the farm Waaihoek p14 and must be relocated.

Due to the **aggravate meteorological conditions** sound are most likely to travel much further near the waterfall as acknowledge in Mulilo's Noise Specialist Report. The save distance of 800m from the proposed turbines to the nearest NSR must increase to 1,5km or even 2km due to that. **Therefore, the following additional proposed turbine positions needs relocation, 31,32,33,34,36 and 40.**

Noise pollution can not only be quantified in decibels (dBA). The sound of running water and wind turbine might measure the same decibels but the first has a calming effect on most people where the later an irritating noise like dripping water.

D - VISUAL IMPACT

1.. **All visual impact as mention in B and C must be addressed.**

2.. My mechanic stays on the farm Windhoek in NSR 2. His daughter is on **chronical medication** for her heart and epileptic. The shadow flickering caused by nearby turbines will trigger her epileptic with fatal consequences. **Turbines 51,52 and 53 need to be relocated.**

3.. Majority of both WEG is located on the **verge of the escarpment which are unacceptable** because **(Appendix 17)**

3.1 The construction works for the infra structure and platforms will need major earthworks with an irreversible negative effect on the nature.
3.2 The access roads to turbines will have steep gradients which will cause major erosion if not concreted paved and side drains.
3.3 Proposed turbines will be highly visible which are going to change the sense of place negatively.
3.4 Biodiversity specialist prescribes in his report that **the rocky outcrop** must be avoided but is blindly ignore by the applicant.

3.5 All turbine positions on slopes more than the maximum 14% as specified in Table 0.5 of the draft EIA report must be condemned.

D – BATS

1. No detail of the specialist in the Appendix
   1.1 Appendix 1 – Figures
   1.2 Appendix 2 – CV of Specialist
   1.3 Appendix 3 – Specialist declaration
   1.4 Appendix 4 – SACNASP certificate.
2. Specialist did not consult with the local farmers to allocate possible roosting sites for bats.
3. There are abandoned natural roosting site on the escarpment for bats in the way of rocky outcrops, cliffs, caves, and redundant torbanite mines that have not been investigate by the bat specialist.
4. **The Bat specialist prescribe in Table 8 of his report that rocky outcrops are no-go areas with 200m buffer. This is blindly ignored by the applicant.**

E – ARGRICULTURAL

1. This income from turbines on the owner's farm got the danger to kept **unproductive farmers** longer on it. This will put **food security** of the whole country on the long run in danger.

2. A influx of construction workers and work seekers can be expected which will lead to an instability in workforce and communities.

3. The **upgrading of road** is positive but will lead to easier movement for criminals with criminal activities to escalate rapidly.

4. Gard's used during construction and afterwards is in many cases part of the criminal activities.

5. The slaughter of bats will have negative effect on the control of insects which then will lead to **increased virus animal diseases**. (bloutong)

6. It is proven that the ultra-low sound and vibration produces by the wind turbines, has a negative effect on the **bee colonies**. They eventually disappear. This negatively influence the pollination of agriculture crops. It will also have a negative influence on the biodiversity of the grasslands.

7. The presence of wind turbines make **crop spraying** impossible. The spraying drome are not powerful enough to follow the landscape profile, very sensitive for wind and much more time consuming than crop spraying by aeroplane. This are not a feasible alternative for crop spraying as claimed in specialist report. The crop sprayer requires at least a 1,5 km clearance next to the site where it is spraying. **Turbines 31, 41 1nd 43 are too close to my crop lands must be relocated**

8. Turbines and powerlines lead to the increase of **veld fires** due to movement of people as well as possible failure of turbines. Due to the inaccessible mountainous area of the escarpment **air support (bombers)** is frequently use to assist in with veldfires. It will not be possible due to the turbines. Veldfires can then easily escalate into the neighbouring plantation with huge financial consequences.

9. Turbines are likely to change the rainfall pattern especially from the east. The lifesaving **dew and mist** will disappear which will escalate the midsummer drought.

F – MICROCLIMATE

The basic scientific mechanism underlying microclimates is that wind turbines alter the surface meteorology through decreased wind speeds and turbulent mixing (Keith et al., 2004; Armstrong et al., 2014)

Wind farms alter the local microclimate by

- increase near- surface temperatures when the descending blades of the wind turbines bring drier air down and the ascending blades of the wind turbines move moister air up. The turbulence generated by wind turbine rotors enhance this vertical mixing
- increase in near-surface temperatures cause lower humidity rates and higher evaporation rates downwind of the turbine
- lower humidity reduces soil moisture levels significantly (3 to 4,5%), leading to drier conditions downwind, which impact on crop yields and plant health
- dew point is the temperature at which air becomes saturated with moisture. Since the occurrence of dew is contingent on near-surface moisture and atmospheric stability, the presence and duration of dew within wind farms, particularly downwind of turbines, is negative impacted by the lower humidity that turbine-induced mixing bring about
- wind farms aggravate the soil drying in grassland areas, which have impacts on grassland ecosystems
- these microclimate changes also influence other ecosystem processes, including greenhouse gas emissions and the carbon intensity of electricity generation.

Turbines are likely to change the rainfall pattern especially from the east. The lifesaving dew and mist will disappear which will increase the midsummer drought on all my properties.

Above will have a negative influence on all my properties and needs detail microclimate investigation by specialist as previous requested my Mpumalanga Department.

G – CONTRAVERSAL CONDUCT by APPLICANT / EAP.

1. No specialist contacted me as registered I&AP because Mulilo abstain my contact details from them. Josua Meyer Trust was shown as I&AP on the list but without any contact detail. This was confirmed by the Sosial specialist when accidental met at Mr Jan Robberts place. Only the avifaunal specialist notifies us before conducting site surveys.
2. No public meetings took place concerning the Sheepmoor / Emvelo proposed WEF.

10/28

3. Mulilo signed an NDA with EWT and AfriAvian concerning the tagged data of the martial eagle to kept detail secret and hidden from the I&AP's.
4. The tagged data of the martial eagles was used selectively in the avifaunal report but Mulilo refuse to share the tagged data with the I&AP's. That prevent the I&APs from their right to obtain independent evaluations.
5. There was also an attempt from Mulilo to silence MTPA by approaching them to sign an NDA.
6. **The applicant used illegal obtained data in their avifaunal specialist report and the EAP allows it.**
7. My request for 'n meeting with Mulilo in February 2025 was denied by them. After my third request Mulilo eventually meet with us on the 11th hour, 4 August 2025. Coincidental just after we revealed the illegal status of the tagged data. **Almost 6 months later!!**
8. Mulilo ignore the biodiversity specialist instruction to avoid the rocky outcrops by locating majority of turbines on the verge of the rocky outcrops. **(Appendix 17)**
9. Mulilo ignore the Bat specialist requirement of a 200m turbine free buffer around the rocky outcrops by locating majority turbines right on the verge of the rocky outcrops **(Appendix 17)**
10. Mulilo blindly ignore Social specialist mitigation recommendations in his report (Table 4.12/13/14) to engage with I&APs about concerns on powerline and turbine placements

11. Mulilo decide on the transmission line route without consent or agreements from the affected land owners.

12. Mulilo went further and just draw an alternative transmission line route through Mr Braam Moody farm. He was never part of the proposed windfarm nor contacted by Mulilo.

13. When landowners disagree with Mulilo they were threatened with the court. It happened with Mr Jan Robberts and Mr Pikkie Vorster

14. Request for the relevant documentation concerning the extension of 3 month to submit EIA report was blindly ignored. It was reluctant reveal only after insisting for it during meeting on 4/08/2025. **Almost 2 months later!!**

15. Response of EAP on DARDLEA requesting microclimate report in scoping report comments that such report was not previously done in RSA is to say the least unprofessional and unacceptable.

16. Mulilo tray to cover up the shooting of the juvenile martial eagle by not reporting it nor opening a case.

Mulilo's modus operandi has proven as very controversial and not transparent

Therefore, we appeal to DFFE to preserve this escarpment with its unique environment and very sensitive ecosystems for our children and reject this application in its totality.

11/28

5.7 Results of Pre-Construction Bird Monitoring

The objective of the pre-construction monitoring at the proposed Emvelo WEF was to gather baseline data over a period of four seasons (seven surveys) on the following aspects pertaining to avifauna:

- The abundance and diversity of birds at the proposed WEF site and at a suitable control site, to measure the potential displacement effect of the wind farm.
- Flight patterns of priority species to assess the potential collision risk with the turbines and associated power line infrastructure.

Monitoring at the WEF sites and a Control Site were conducted by a team of monitors during the following time envelopes:

- 21 February–03 March 2022
- 21–27 April 2022
- 01–16 June 2022
- 06–21 October 2022
- 14–17 January 2023 (Transect counts only)
- 05–09 May 2023
- 28–30 June 2023
- 22–26 August 2023

Additional Vantage Point and Transect Count monitoring was conducted near the identified Martial Eagle nest to gain a better understanding of their flight behaviour. Five surveys were conducted, in addition to the seven surveys completed as part of the pre-construction monitoring.

The five additional surveys were conducted during the following time envelopes:

- 17–22 October 2023
- 15–23 November 2023
- 30 November–05 December 2023
- 17–22 January 2024
- 14–20 February 2024

Table 7 and **Figure 11–12** below present the results of the pre-construction monitoring conducted at the WEF site and control area.

5.7.1 Transects

The results of the transect counts after seven surveys are presented in Table 7:

Table 7: The Results of The Walk and Drive Transects.

TURBINE SITE	
Species Composition	**Number**
All Species	180
Priority Species	19 (11%)
Non-Priority Species	161
Total Count	
Drive Transects	10 583
Walk Transects	8095
Total	18 678
CONTROL SITE	

12/28

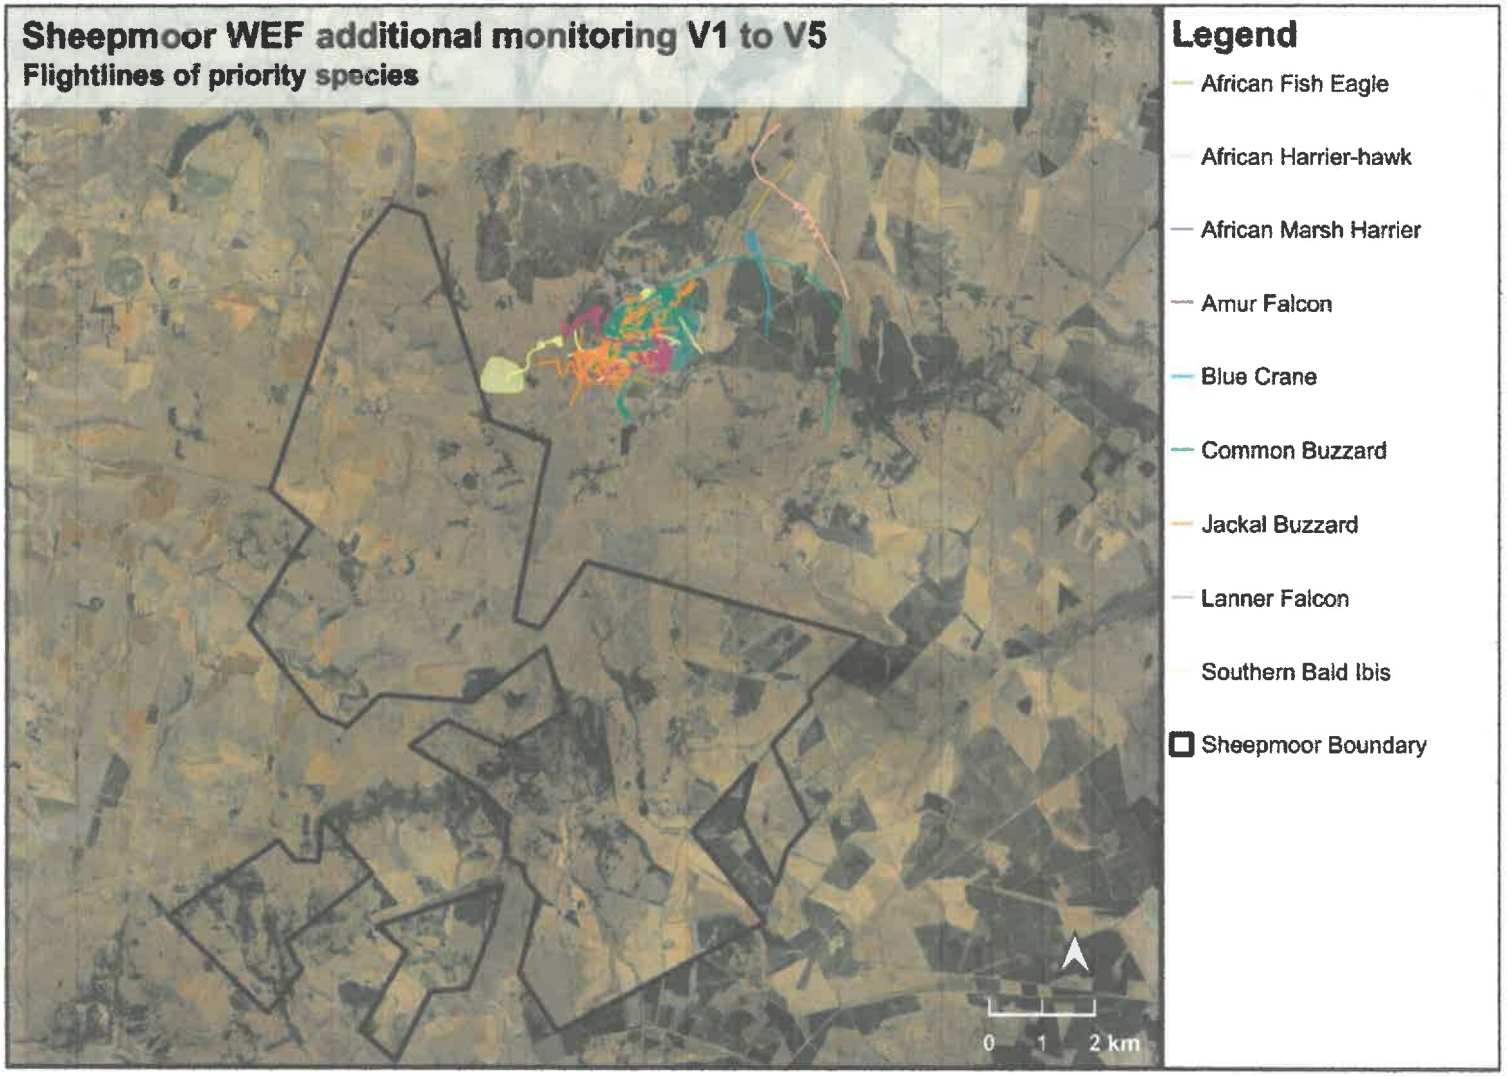

Figure 19: Recorded flight lines of all other priority species (excluding Martial Eagle) during the additional five surveys (V1 to V5) in and near the Sheepmoor WEF Project Site .

Re : Draft EIA report for EMVELO and SHEEPMOOR proposed WEF

Dear Mr Barbeau

The request for the data recovered from the two tagged martial eagles remains outstanding.That deprives my right as IAP to submit constructive comments on the draft EIA report.

An email was received on 14/04/2025 from Mr Johans van Wyk of the applicant in this regard. Due to your silence I like to take the opportunity to react to that. Although time for comments depart already but this is a friendly request to include this response in the comments due to ERM non-response.

The oldest trick in the book is to get your opposition on board. EWT is a NGO organization surviving on donations which might also play a part in the partnership. The moment EWT entered in a non-disclosure partnership with the applicant it destroyed their impartiality and credibility. Their name should read now ENDANGER for WILDLIFE TRUST.

It is extremely arrogant and offencive from the applicant to assume there is only one accredited avifaunal specialist. The applicant is correct that a second specialist might not come to a similar conclusion but is likely to arrive at a more meaningful conclusion due to his independence.

The combination of information/data/insights the applicant mentioned is already incorporated by the eagle in its tagged flight data. The value of that flight data is that it is undistorted and can not be adapted to fit the applicants application.

A few concerns regarding the applicant's experience project avifaunal specialist

7/10/25, 10:32 PM Gmail - Request for proprietary information and data

- the martial eagle nest was disclosed by a local farmer and not by the specialist field monitoring team during their seven site visits. This was revealed by Mr Lloyd Barnes of the applicant during a meeting at Mr Jan Robberts house in the presence of witnesses.

- site field monitoring was only executed during 8 months of the year with no monitoring during four crucial summer months (21/10/2022 to 21/02/2023) Therefore the specialist failed to identify important priority bird species breeding sites including both crane species.

- when an active Mahem breeding nest was reported to Mulilo's specialist in January 2025 no attempt was made to visit or even to record the location. The same response was experienced from Mr Lloyd Barnes from the applicant.

- a 60 year plus old breeding site of the Southern Bald Ibis was shamefully not identified

the specialist signed a non disclosure agreement with the applicant and with that sacrificed his independence.

The applicant had taken a long shot trying to classify the tracking data under NEMBA and is advised rather to pay attention to its permit conditions. The applicant is already in breach of item 1.9 and 1.10 of his permit and runs the danger that it might be cancelled.

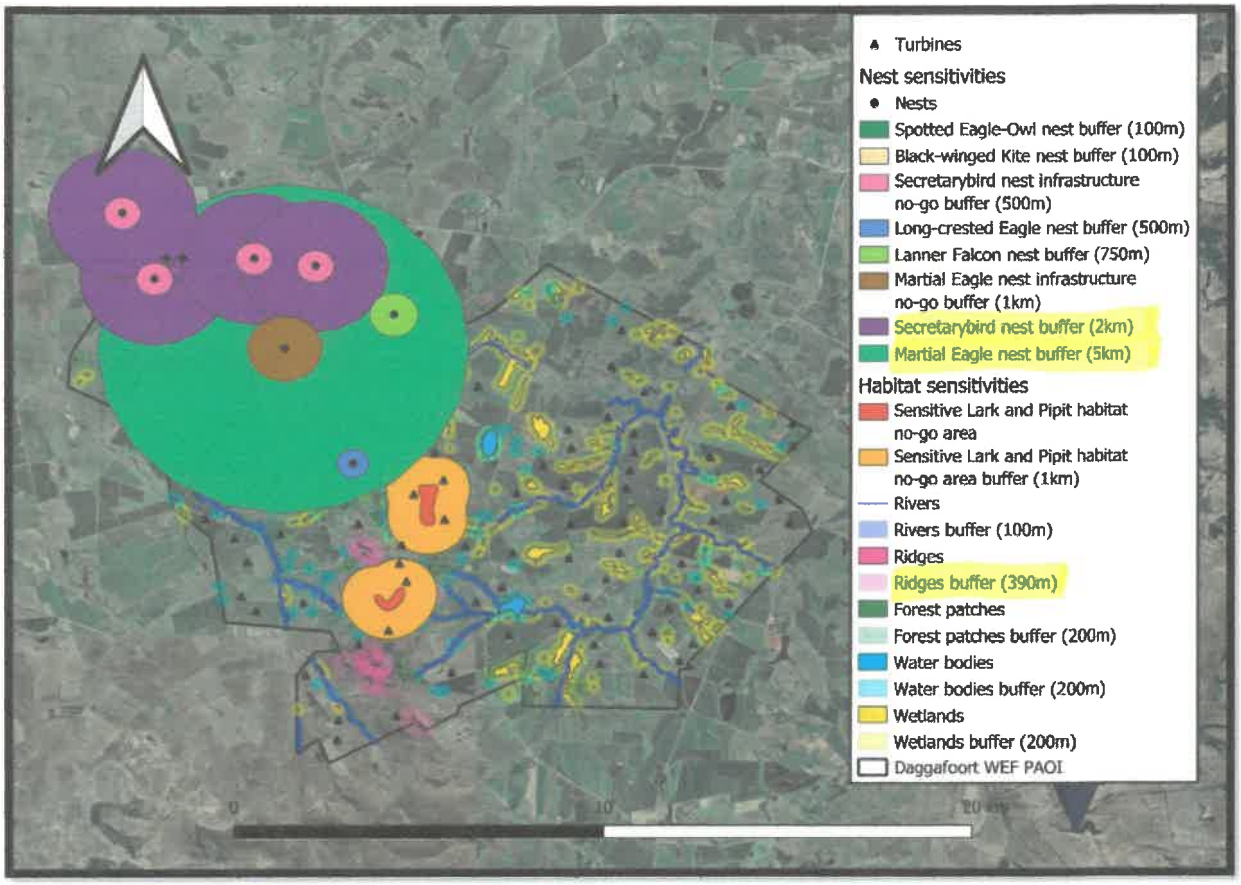

Figure 12. Preliminary turbine layout and avifaunal sensitivities for the Daggafoort WEF

At present, a number of road upgrades and new roads are proposed within sensitive habitat for avifauna. Where new roads are likely to encroach within 1kmof the nest sites for SCC, such as the two 2km Secretarybird nest buffers, construction should take place outside of the peak breeding period (Aug-Oct) until any chicks have fledged successfully. 500 m infrastructure free buffers have been assigned to these Secretarybird nests.

Figure 14: Avifaunal **Sensitivities** Map for the **Phefumula Emoyeni One WEF**. **Wind turbine exclusion zones indicated in red.**

5.6. Specialist Sensitivity Analyses and Verification

5.6.1 Very High Sensitivity: All Infrastructure Exclusion Zones

Martial Eagle nest: a 2.5km all infrastructure exclusion zone should be implemented and maintained around the identified Martial Eagle nest (coordinates can be provided) to avoid displacement and/or breeding failure due to disturbance.

Secretarybird nests: a 500m all infrastructure exclusion buffer zone should be implemented and maintained around the two identified Secretarybird nests (coordinates can be provided) to avoid displacement and/or breeding failure due to disturbance.

Southern Bald Ibis colonies: a 1km all infrastructure exclusion buffer zone should be implemented and maintained around the three identified Southern Bald Ibis colonies (coordinates can be provided) to avoid displacement and/or breeding failure due to disturbance.

5.6.2 Very High Sensitivity: Turbine Exclusion Zones

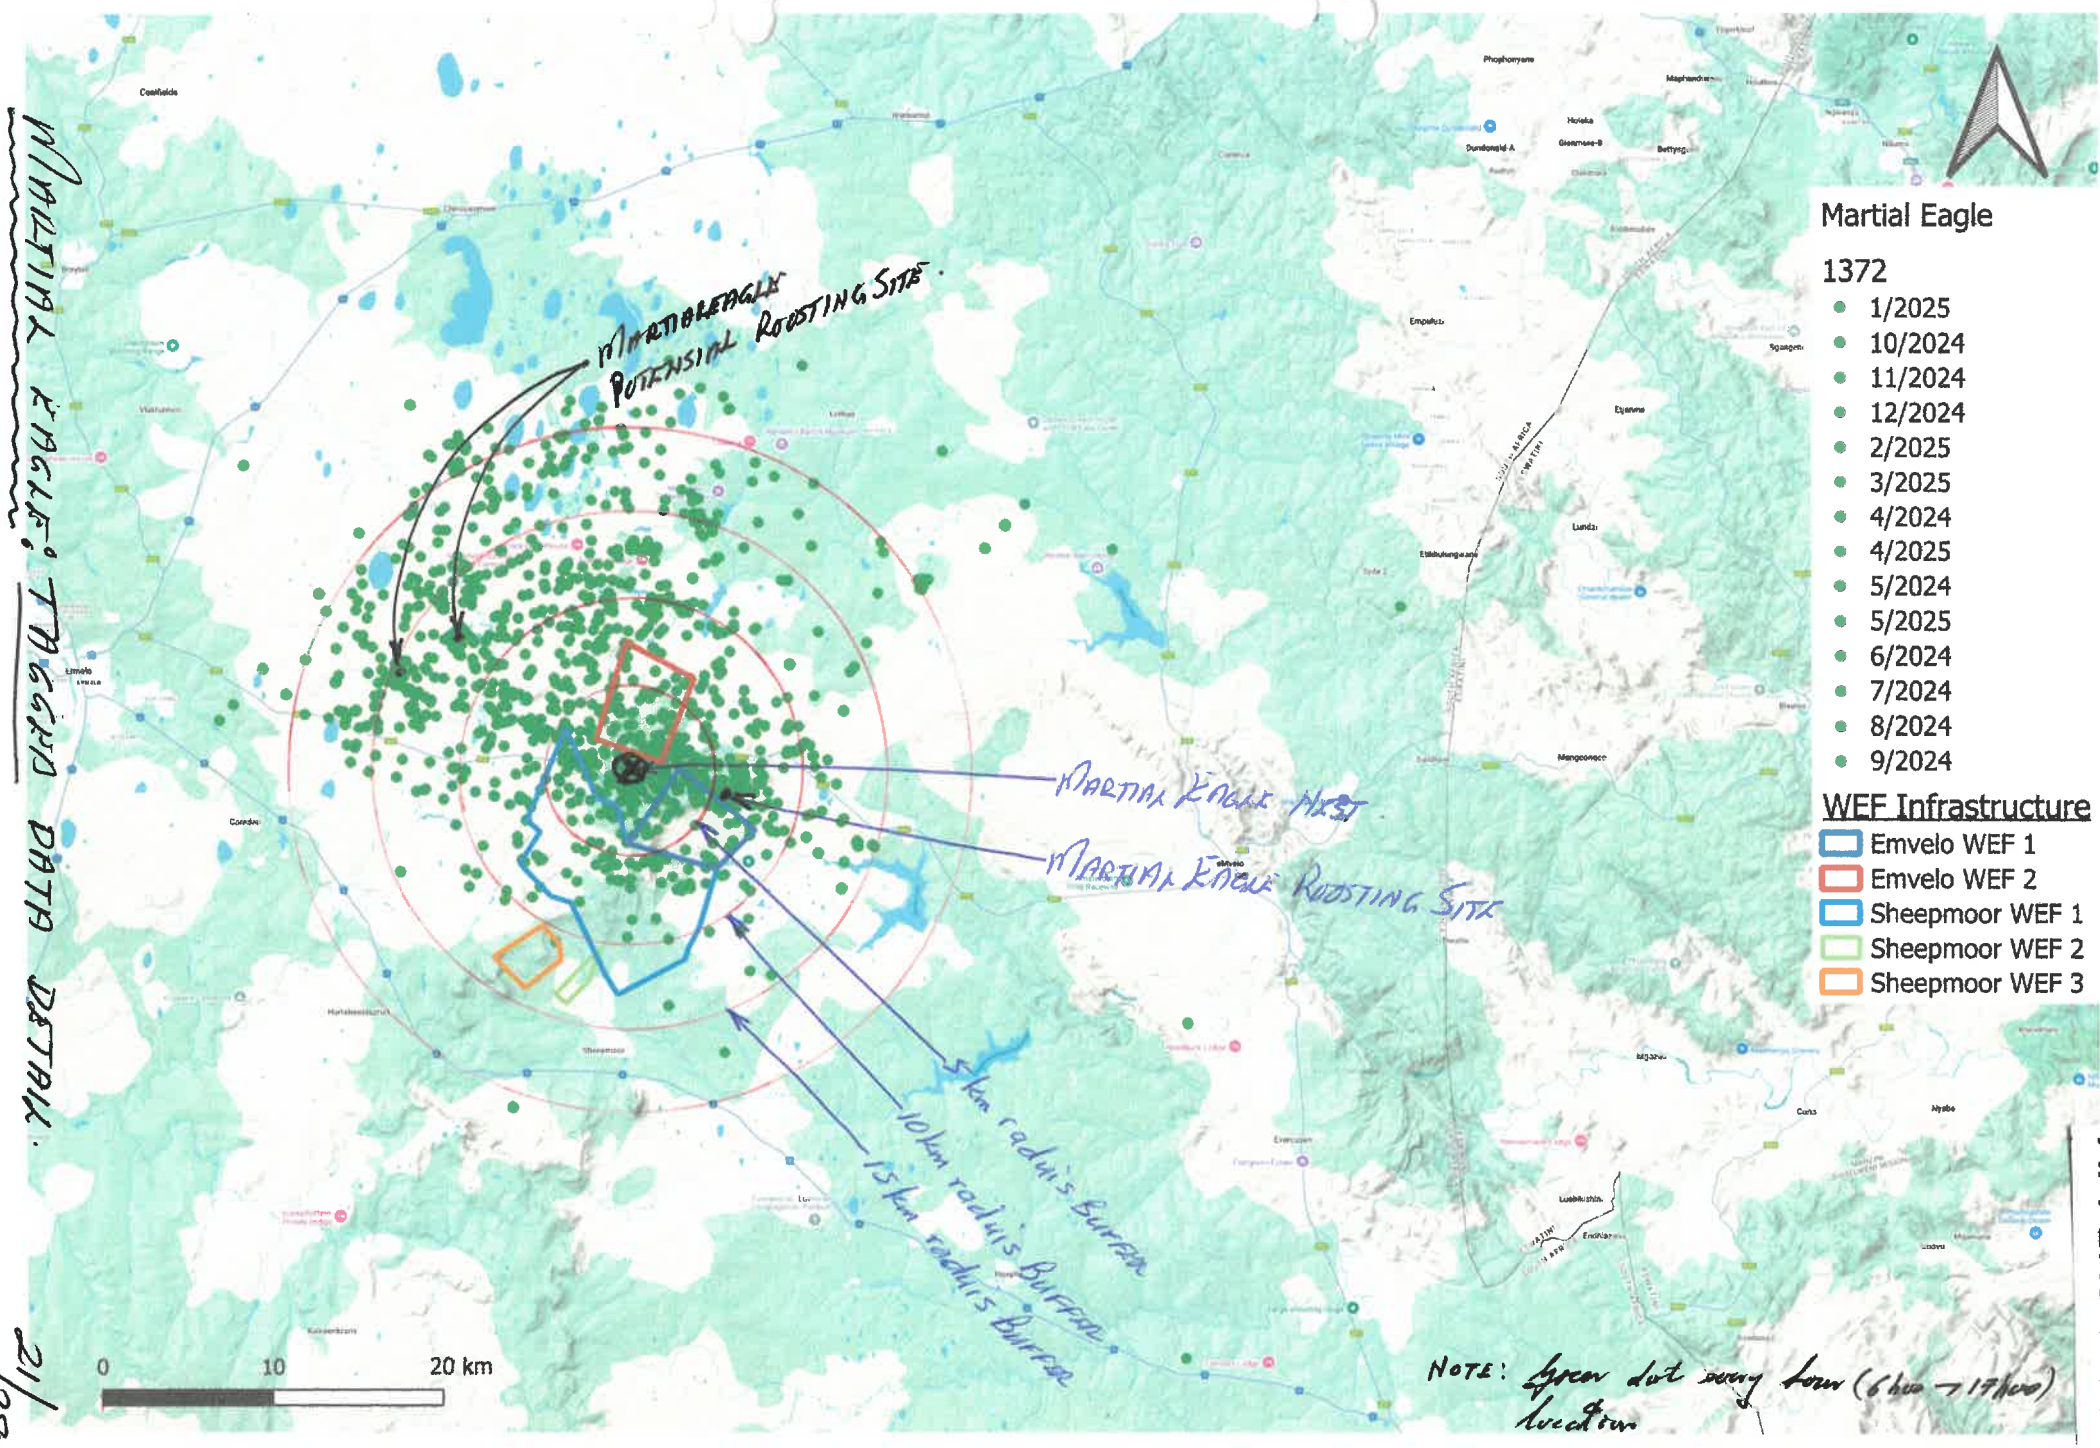
Secretarybird nests: a 1km wind turbine exclusion zone (including the rotor swept area) should be implemented and maintained around the identified Secretarybird nests to minimize the risk of collisions and to avoid displacement due to disturbance.

Southern Bald Ibis colonies: a 2.5km wind turbine exclusion zone (including the rotor swept area) should be implemented and maintained around the identified Southern Bald Ibis colonies to minimize the risk of collisions and to avoid displacement due to disturbance.

Black Sparrowhawk nests: a 750m wind turbine exclusion zone (including the rotor swept area) should be implemented and maintained around the two identified Black Sparrowhawk nests (coordinates can be provided) to minimize the risk of collisions and to avoid displacement due to disturbance.

Martial Eagle nest: a 5km wind turbine exclusion zone (including the rotor swept area) should be implemented and maintained around the identified Martial Eagle nest (coordinates can be provided) to minimize the risk of collisions and to avoid displacement due to disturbance.

Heronry: a 300m wind turbine exclusion zone (including the rotor swept area) should be implemented and maintained around the heronry to minimize the risk of collisions and to avoid displacement due to disturbance.



Natural pans: A 2km wind turbine exclusion zone (including the rotor swept area) should be implemented and maintained around natural pans.

Drainage lines, wetlands, dams: Major drainage lands and wetlands must be buffered according to the requirements of the aquatic specialist. The buffer zones must be classified as rotor swept free zones. Wetlands (including dam margins) are important breeding, roosting and foraging habitat for a variety of Species of Conservation Concern (SCC), most notably for African Grass Owl (Regionally Vulnerable), Greater Flamingo (Regionally Near Threatened), Yellow-billed Stork (Regionally Endangered), and Blue Crane (Regionally Near Threatened). These SCC have all been recorded in the Broader Area through the Southern African Bird Atlas Project (SABAP2). It should also be noted that any road and/or grid line crossings across these features should be restricted to what is unavoidable.

5.6.3 Medium Sensitivity: Limited Infrastructure Zones

Secretarybird nests: A 2.5km buffer zone must be implemented around the two identified Secretarybird nests (coordinates can be provided). If turbines are located in these zones, they must be subject to Shutdown on Demand (SDoD).

Cc: **Lloyd Barnes** <Lloyd@mulilo.com>, ERM ArcusAmsterdam@erm.com <ERM.ArcusAmsterdam@erm.com>

Dear Mr Meyer,

RE: Please see below formal communications from Mulilo pertaining the Amsterdam Wind Energy Project.

Thank you for your inquiry and for your evident dedication to the conservation and understanding of Martial Eagles. We appreciate your interest in this species and acknowledge the depth of care you have expressed in your request.

As this is a protected species, the tracking data related to Martial Eagle flights, nesting locations, and movements is sensitive information that must be managed responsibly. Mulilo Renewable Project Developments, in partnership with the Endangered Wildlife Trust (EWT) is the custodian of the Data, and access to it is subject to strict regulatory and ethical considerations. We also note that your request to use this data in assessing the proposed buffer distances would not provide your specialist with the necessary insights. The buffer proposed by the project's avifaunal specialist in the draft environmental Impact Assessment was not solely based on tracking data, but included a combination of the following information/data/insights:

- Proprietary commercial Data from our met mast;
- Findings, data and in-depth site experiences gained by the specialist from the long-term bird monitoring program conducted before tracking began, following South African bird monitoring guidelines; and
- An additional focal point survey of the nest itself, over a number of months including substantial observed and documented flight paths; and
- Detailed site specific vegetation and habitat mapping and modelling.

Given this, the specific tracking data you have requested would not contribute meaningfully to further understanding or reassessment of the proposed buffer zones. A second specialist, without the above mentioned information and experience, is unlikely to arrive at a similar or meaningful conclusion of the recommended buffer size and shape. Furthermore, it must be noted that the project specialist, as required by the NEMA EIA regulations, is independent of the applicant, is SACNASP registered, and has complied with all guideline requirements to obtain an informed buffer and set of recommendations for the project.

Additionally, under the National Environmental Management: Biodiversity Act (NEMBA), this tracking

program is classified as bioprospecting. Accessing or conducting research on such data requires a permit, which neither you nor your specialist have provided. Without the necessary permit, we are unable to share this information.

Sincerely,

Johans van Wyk

Hi Lloyd,

Please note that we have received comments and concerns from an I&AP who operates a landing strip near the proposed development.

These comments were originally submitted on 22 April after the previous Draft EIA Phase PPP period. The I&AP has now resubmitted the same comments during the current PPP period.

Given the nature of the concerns raised, and that the submission has come via the I&AP's legal representative, we kindly request that the Mulilo legal team review the comments and provide any necessary input.

Regards,

Dear Sir/Madam

We have briefly perused the draft EIA report and have been unable to find any reference to the comment submitted by us on the instructions of our client, a copy of which is attached to this email.

Kindly refer us to the relevant pages of the draft report which deal with our client's comments?

We further note from the draft report that a formal application has been lodged with Air Traffic and Navigation Services (ATNS) for a formal obstacles assessment to be conducted. Kindly furnish us with a copy of this application and all communications to and from ATNS relating thereto.

We look forward to hearing from you as a matter of urgency.

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Subject: Comments on the draft EIA report for Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province - NWJ Vorster Trust

You don't often get email from vorsterboerdery@lantic.net. Learn why this is important

EXTERNAL MESSAGE

The NWJ Vorster Trust is thankfully not part of the proposed WEF anymore.
We will still be affected by the wind farm if it becomes a reality.
Therefore we want to raise our strongest concern against it.

1. All the turbines, on the edge of the escarpment, will permanently scar the scenery and is unacceptable.
2. We are very concerned about proposed turbines 40, 44, 45 and 46 because of the noise and most probably shadow flickering.
3. The same applies for turbines 51, 52 and 53.
4. Turbines 40, 41,42,43,44,45,46, 51 and 52 will cause visual pollution which is unacceptable.
5. Proposed turbines 40,043 and 44 are too close to the breeding site of the secretary bird. A safe no-go zone of at least 2,5km should be implemented around the nest. The two secretary birds stay in the area south east of this location and provision should be made to secure its foddering habit.
6. A Marial Eagle pair were spotted several times in the past at Farm Klipfontein. It is of great concern because the always fly off in a north east direction where most of the turbines will be located.
7. The southern bald ibis are also present in great numbers on the farm Klipfontein especially when cultivating land or harvesting. Provision should be made for a safe flying zone to their roosting site on neighbouring farm Windhoek where four turbines will be located.

EXTERNAL MESSAGE

Hi All

Will we, and should we, send a copy of the final CRR to Mr Meyer when we submit to DFFE?

Kind regards,

Andrew Pearson *Pr.Sci.Nat* (400423/11)
Senior Manager: Head of Environmental
[redacted]
www.mulilo.com

Subject: FW: FW: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Hi Lloyd,

As discussed, I will reply to Mr Meyer below acknowledging his email and inform him that his comments will be added to the CRR's and our responses will be provided within the report itself.

Kind Regards

Lucien Barbeau

EXTERNAL MESSAGE

Dear Lucien

Just want to get the records straight without getting into an informal debate

1 - 4 : Correspondence

- Request info from ERM, Mr Lucien Barbeau, on 17/12/2024 at 11h04.
  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.
  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35
  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?
  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.
  Meeting took place on 4/08/2025.

Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.
Repeat request during meeting of 4/08/2025
Received info only on 12/08/2025
Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59
Repeat request for tagged data from ERM on 29/03/2025 at 11h44
Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.
Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.
Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct
The issue is not who did wrong but is the tagging done with a valid permit.?
If not, then it is illegal and that also implies for the data obtained by the unlawful act.
What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?
Very dangerous and controversial approach..
We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

>
> MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs,

and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.

ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.

While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.

We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of

scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case. Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives, identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Subject: Comments on the draft EIA report for Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province - NWJ Vorster Trust

You don't often get email from vorsterboerdery@lantic.net. Learn why this is important
EXTERNAL MESSAGE

The NWJ Vorster Trust is thankfully not part of the proposed WEF anymore.
We will still be affected by the wind farm if it becomes a reality.
Therefore we want to raise our strongest concern against it.

1. All the turbines, on the edge of the escarpment, will permanently scar the scenery and is unacceptable.

2. We are very concerned about proposed turbines 40, 44, 45 and 46 because of the noise and most probably shadow flickering.
3. The same applies for turbines 51, 52 and 53.
4. Turbines 40, 41,42,43,44,45,46, 51 and 52 will cause visual pollution which is unacceptable.
5. Proposed turbines 40,043 and 44 are too close to the breeding site of the secretary bird. A safe no-go zone of at least 2,5km should be implemented around the nest. The two secretary birds stay in the area south east of this location and provision should be made to secure its foddering habit.
6. A Marial Eagle pair were spotted several times in the past at Farm Klipfontein. It is of great concern because the always fly off in a north east direction where most of the turbines will be located.
7. The southern bald ibis are also present in great numbers on the farm Klipfontein especially when cultivating land or harvesting. Provision should be made for a safe flying zone to their roosting site on neighbouring farm Windhoek where four turbines will be located.

Regards,

Hi Lloyd,

Please note that we have received comments and concerns from an I&AP who operates a landing strip near the proposed development.

These comments were originally submitted on 22 April after the previous Draft EIA Phase PPP period. The I&AP has now resubmitted the same comments during the current PPP period.

Given the nature of the concerns raised, and that the submission has come via the I&AP's legal representative, we kindly request that the Mulilo legal team review the comments and provide any necessary input.

Regards,

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

HI Andrew

We will make the final CRR available to all registered I&APs- the notification will contain a link for him to access the CRR.

Are you wanting to send him a hard copy or usb or something like that?

EXTERNAL MESSAGE

Dear Lucien

Just want to get the records straight without getting into an informal debate

1 - 4 : Correspondence

- Request info from ERM, Mr Lucien Barbeau, on 17/12/2024 at 11h04.
  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.
  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35
  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?
  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.
  Meeting took place on 4/08/2025.
  Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.
  Repeat request during meeting of 4/08/2025
  Received info only on 12/08/2025
  Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59
  Repeat request for tagged data from ERM on 29/03/2025 at 11h44
  Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.
  Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.
  Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct
The issue is not who did wrong but is the tagging done with a valid permit.?
If not, then it is illegal and that also implies for the data obtained by the unlawful act.
What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?
Very dangerous and controversial approach..
We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

>
> **1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?**
>
> MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs, and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.
>
> ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.
>
> **2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?**
>
> ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.
>
> While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.
>
> We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.
>
> **3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?**

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case. Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives, identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Kind regards,

Lucien Barbeau

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

We acknowledge your request for a meeting to discuss the concerns raised. In consultation with the applicant, Mulilo, we are proposing a provisional date of Wednesday, 7 August 2025, with the meeting to be held at a venue in Ermelo. Kindly confirm whether this date is suitable for you and whether you will be attending alone or accompanied by others.

As a registered I&AP, your comments form an important part of the formal public participation process and will be incorporated into the Final EIA Reports. We also acknowledge the concerns raised regarding the tagging of the Martial Eagles. Relevant documentation, including permits, will be made available where appropriate to support transparency and clarity during the engagement.

We look forward to your response.

Kind Regards,

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Goodday Sir

The avifaunal specialist removed in both reports, Sheepmoor WEF and Emvelo WEF, the High Sensitivity - Turbine Exclusion Zone in Figures 33 for the aquatic buffer zones from an avifaunal perspective.

It must be an unintentional mistake and request reinstatement of it.

If it was deliberate we request the detailed reasoning and motivation for such a drastic decision.

Thanks

Josua Meyer

> Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Hi Lloyd,

Please note that we have received comments and concerns from an I&AP who operates a landing strip near the proposed development.

These comments were originally submitted on 22 April after the previous Draft EIA Phase PPP period. The I&AP has now resubmitted the same comments during the current PPP period.

Given the nature of the concerns raised, and that the submission has come via the I&AP's legal representative, we kindly request that the Mulilo legal team review the comments and provide any necessary input.

Regards,

EXTERNAL MESSAGE

Dear Lucien

Just want to get the records straight without getting into an informal debate

1 - 4 : Correspondence

- Request info from ERM, Mr Lucien Barbeau, on 17/12/2024 at 11h04.

  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.

  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35

  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?

  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.

  Meeting took place on 4/08/2025.

  Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.

  Repeat request during meeting of 4/08/2025

  Received info only on 12/08/2025

  Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59

  Repeat request for tagged data from ERM on 29/03/2025 at 11h44

  Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.

  Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.

  Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct

The issue is not who did wrong but is the tagging done with a valid permit.?

If not, then it is illegal and that also implies for the data obtained by the unlawful act.

What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?

Very dangerous and controversial approach..

We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

> Thank you

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs, and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.

ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.

While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.

We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available

during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit

in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case. Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives, identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo

without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs

from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

15 August 2025

Dear Stephanie,

RE: COMMENTS ON THE ENVIRONMENTAL IMPACT ASSESSMENT PROCESS FOR THE PROPOSED EMVELO WIND ENERGY FACILITY AND SHEEPMOOR WIND ENERGY FACILITY [DFFE REFERENCE NUMBERS: 14/12/16/3/3/2/2611 & 14/12/16/3/3/2/2613]

1. INTRODUCTION

1.1. This document contains comments on the Environmental Impact Reports ("DEIRs") and associated Annexures for the proposed Emvelo and Sheepmoor Wind Energy Facilities ("WEFs") which were made available to interested and affected parties ("I&APs") during July 2025.

1.2. These comments are submitted on behalf of Mr. Josua Meyer a registered I&AP and owner of Portions 3, 4, 12 and 14 of the Farm Waaihoek No. 286, as well as Portions 4, 5 and 6 of the Farm Onverwacht No. 287, and Portion 7 of the Farm Windhoek No. 291.

1.3. Comments on the first version of the Draft EIA Report (March 2025) were provided within the commenting period timeframe of 30 days (i.e. by 10 April 2025) and covered both the proposed Emvelo and the Sheepmoor WEFs in a single report. ERM have released a second draft of the EIA Report dated July 2025 and the commenting period closes on 15 August 2025. The comments herein are supplementary to those made on the initial Draft EIA Reports of March 2025 and are not to be taken as substituting those earlier comments.

Unit 126, Victoria Junction

Web: www.megateam.co.za

Reg No. 1999/069163/23
Vat No. 412 0186921

1.4. It must be noted that the comments, recorded herein, are based on a review of select items using examples primarily from the Sheepmoor Draft EIA Report and associated documents, but apply equally to the proposed Emvelo WEF. This is because the same approach has been adopted by ERM for both projects.

2. FLAWED PUBLIC PARTICIPATION PROCESS (PPP)

User unfriendly documentation places an undue burden placed on I&APs

2.1. As noted in our comments of April 2025, an undue burden is placed on I&APs in the context of being forced to comment simultaneously on the EIA documents related to these two proposed WEFs. This situation has not changed in relation to the current commenting period. Yet again, an undue an unreasonable burden is placed on I&APs to comment on two Draft EIA Reports for two separate applications for the projects located adjacent to each other and proposed by the same Applicant. The commenting periods run concurrently which effectively reduces the opportunity for meaningful public participation.

2.2. In fact, as is noted elsewhere in these comments, the sites of the proposed WEFs have changed, such that they overlap to some extent. This points to the fact that separating these applications is a ruse and that it is unjustified and unreasonable to treat these as two separate applications. It serves no logical impact management purpose and simply places an undue and undesirable burden on the EIA system – I&APs, the commenting authorities and the Competent Authority.

2.3. Also noted in our comments of April 2025, the PPP reports for the respective proposed WEFs are difficult to follow. This situation persists with the current reports– no discernible effort by the EAP has been made to make these documents more user-friendly in this 'second version' of the Draft EIA Report.

2.4. There is extensive duplication of the same correspondence, which makes it an arduous exercise to track the sequence of different activities undertaken and also the issues raised by I&APs (Appendix 6 of the PPP report). Some correspondence is repeated more than 10 times. It also makes it exceedingly difficult to find the original comments made by an I&AP. This adds to the unfair burden on I&APs and reduces the opportunity for meaningful public participation.

2.5. In certain instances, one cannot read the original comments in their entirety (i.e. read the full letter or email from submitted by an I&AP) as the original communication is not provided. Thus, in these cases comments are only available in a disjointed point-by-point fashion in a tabular format (i.e. Section 7 – Comments and Responses Report in Volume III - PPP Report), hereafter referred to as the CRR. This adds to the unfair burden on I&APs and reduces the opportunity for meaningful public participation.

2.6. The burden placed on I&APs is exacerbated by the fact that the EAP has not clearly indicated or described what has changed, such as which specialist reports have been revised or which sections of the Draft EIA Reports have been updated. In addition, the documents themselves

do not show where changes have been made through use of underlining or a different colour text. This means I&APs are faced with having to compare the two draft reports (version 1 with version 2) to ascertain what changes have been made. Clearly this is wholly unreasonable and constitutes unfair process.

DFFE requirements in respect of PPP not met

2.7. The requirement by the DFFE which were communicated to the EAP regarding inclusion of original comments have not been met (see Sheepmoor PPP Report, Section 7 - CRR, page 47).

2.8. DFFE stated that: "Copies of the original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity, must be submitted with the Final EIAr." If these comments are required for the Final EIR Report, then it follows that must also be available in the Draft EIA Reports. Examples of missing original comments are:

2.8.1. Most notably, the **original comments on the first version of the Draft EIA Report** (dated March 2025) from DARDLEA and MTPA **are not provided** in the CRR, which forms part of the suite of documents that make up the July 2025 Draft EIA Report. These comments were submitted on 10 April 2025 (as per the CRR), but the original submissions are not included in the PPP Reports. This is the case for both Emvelo and Sheepmoor. This has been fact-checked through searching for DARDLEA, 10 April 2025, April 2025 as well as scrolling through Appendix 6 of the CRR. The EAP is requested to explain this material omission.

2.8.2. The comments submitted by Richard Summers Inc. and MEGA on the March 2025 Draft EIA Reports are ignored and not included. Email communication dated 10 April 2025 from Richard Summers Inc to ERM confirming that comments had been submitted is included in Appendix 6 of the CRR (see pages 371 and 372 Emvelo CRR and pages 377-379 Sheepmoor CRR). Several searches of both CRRs have been conducted, using various search terms as well as scrolling slowly through the respective documents. **The comments are nowhere to be found**. The EAP is requested to explain this material omission.

2.9. The DFFE also required the following: "All issues raised and comments received during the circulation of the SR and draft EIAr from registered Interested and Affected Parties (I&APs) and organs of state, as listed in your I&APs Database, and others which have jurisdiction in respect of the proposed activity must be adequately addressed and included in the final EIAr" (see Sheepmoor PPP Report, Section 7 - CRR, page 46). This also has not been achieved:

2.9.1. The aforementioned comments from Richard Summers Inc are not recorded in the CRR tables in either of the CRR reports (See Section 7). This means they have been completely ignored.

2.9.2. The comments of 15 April 2025 from Mr Joshua Meyer are not included in the CRR tables in either of the CRR reports (See Section 7). Since this communication involved follow-up

on previous comments to which Mr Meyer had not received an adequate response, these comments ought to have been included. The relevant correspondence can be found on page 369 of Appendix 6 Emvelo CRR and page 375 of Appendix 6 Sheepmoor CRR.

2.9.3. Two landowners, of which at least one is a neighbour, requested inclusion as an I&AP. These requests were submitted on 9 April 2025 (Mr Braam Moodie) and 4 April 2025 (Restov Boerdery). Neither of these I&APs were afforded a fair opportunity to comment on the Draft EIA Report – they were simply provided with a link to the EIA documentation. There is no evidence of any effort by the EAP to afford them a meaningful opportunity to comment or to assist them in familiarising themselves with the proposed projects and associated EIA process.

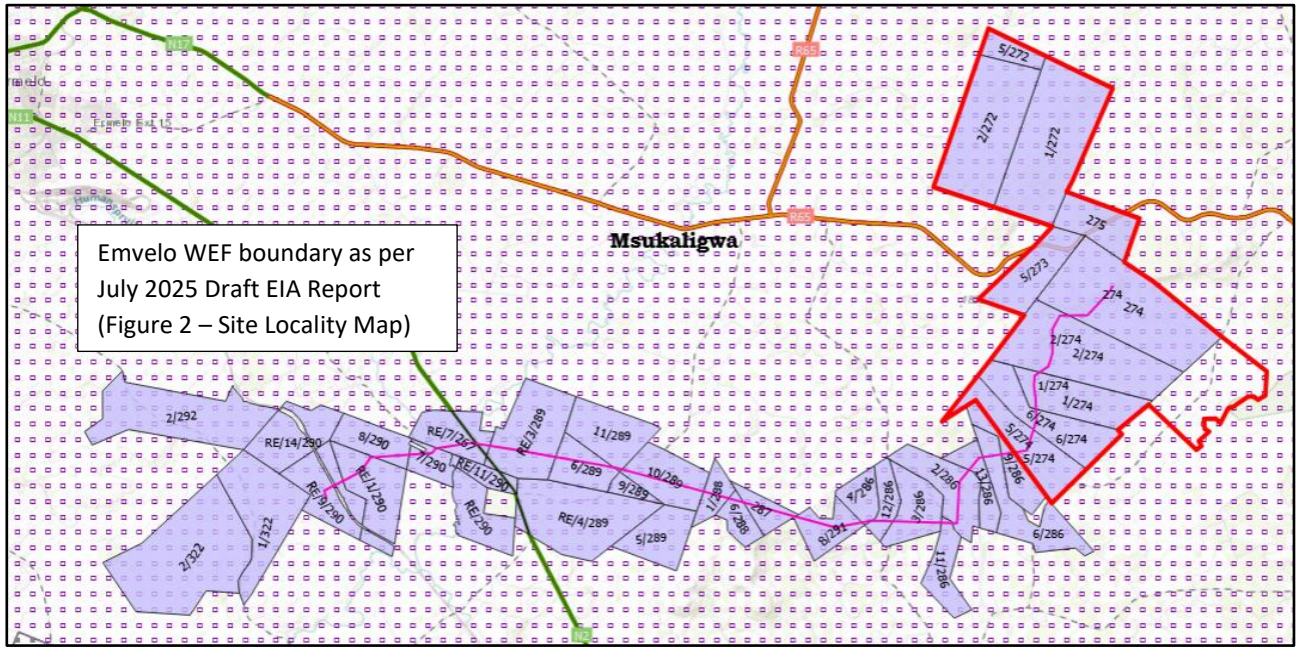
2.10. Whilst one of the uses of the CRR by I&APs is the ability to cross-reference a response from the EAP to the relevant section in the Draft EIA Report to see whether the I&AP's input was actually addressed (i.e. a change is discernible in the report) – this is of no use if an I&AP's comments are not recorded in the CRR first place. This is relevant because not all comments are recorded in the CRR. It therefore follows that these comments have not been considered at all.

3. INFORMATION PROVISION AND PRESENTATION

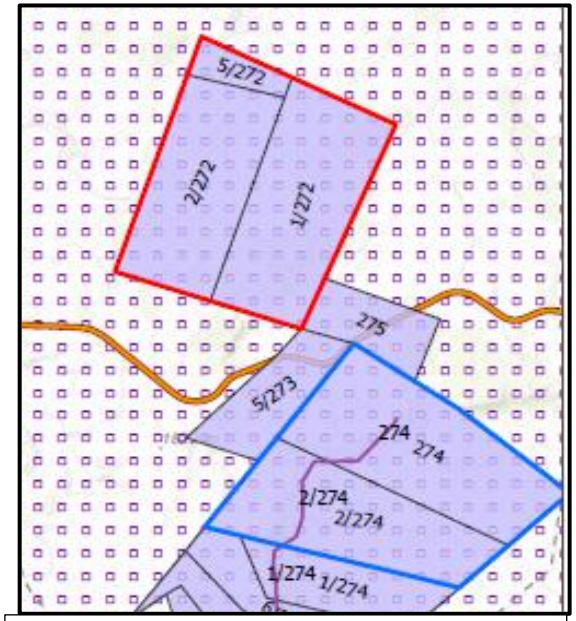
Confusing, unclear and poor-quality information

3.1. The site boundaries shown in the second version of the Draft EIR Report (dated July 2025) differs for both sites relative to the Draft EIA Report issued in March 2025. This is confusing and casts doubt on the accuracy of the information in the reports:

3.1.1. Portions 1, 6 and 5 of Farm 274, Farm Schiedamre are shown in the list of affected farm properties for both Sheepmoor (See Table 0.2) and Emvelo (See Table 0-2).

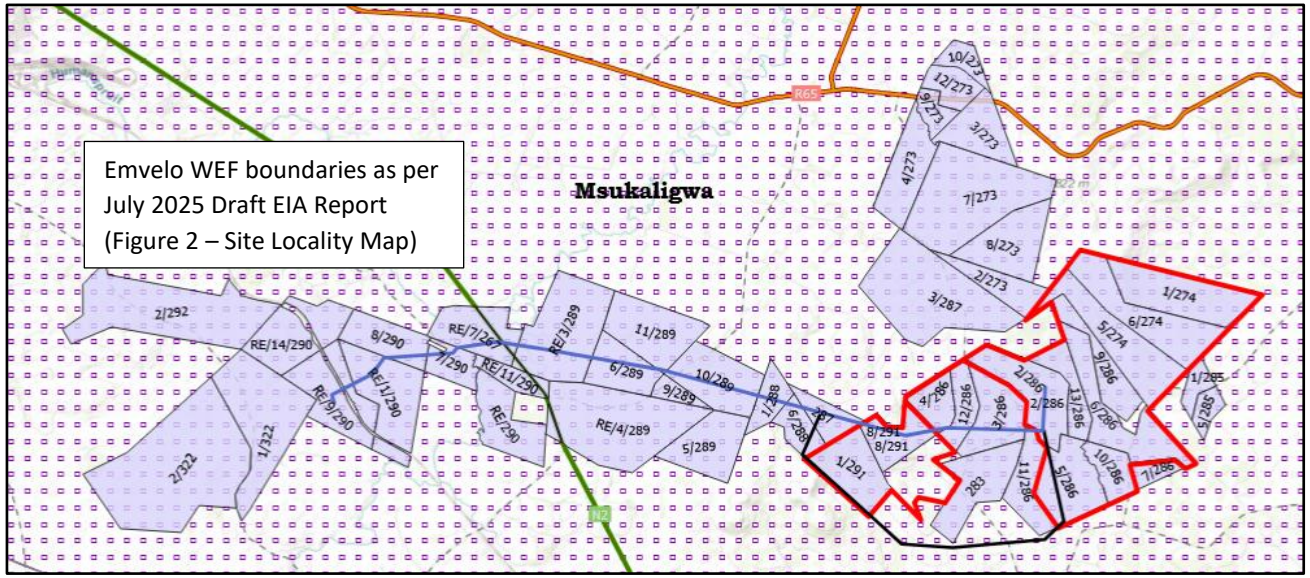


3.1.2. Further to the above, this is the case in both versions of the Draft EIA Reports, that is the March 2025 (Version 1) and July 2025 (Version 2), but the maps and diagrams in the March 2025 Draft EIA Report show a site boundary that does not include the aforementioned properties. This means that tabulated information (Table 0-2) in which affected farm properties are recorded for the proposed Emvelo WEF and the site boundary shown in diagrams and maps are different.

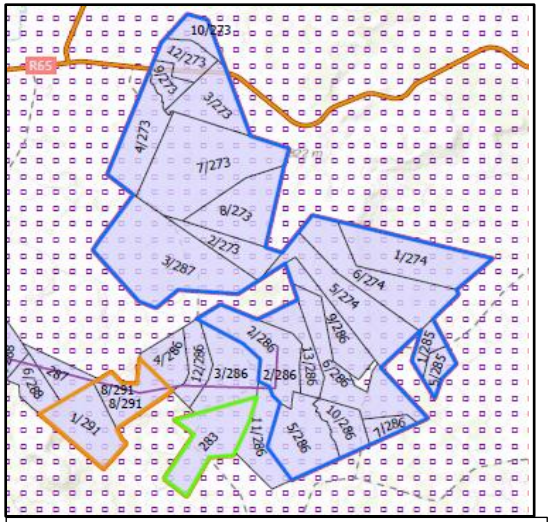


3.1.3. In addition, the site boundary for the proposed Sheepmoor WEF differs in the July 2025 Draft EIA Report, relative to that shown in the earlier version of March 2025. No explanation for the change is given. To add to the confusion, this change is not reflected in all of the maps / diagrams in the July 2025 Draft EIA Report. All of the figures in Section 6: Description of the Baseline Environment in the July 2025 Draft EIA Report show the old site boundary (i.e. as per the March 2025 Draft EIA Report).

3.1.4. The positions of WTGs on the overlapping farm portions (Portions 1, 6 and 5 of Farm 274,



Farm Schiedamre) is unclear. Neither a written description nor a combined diagram showing WTG positions associated with the respective projects on these parcels of land is provided and the project information is materially deficient.



3.2. The evidence for the situation described above is shown in the following diagrams and tables. Boundary coordinates are listed in the tables, which show that no changes have been made to this list of boundary coordinates (the example is taken from the Sheepmoor Draft EIA Reports) provided in the March 2025 versus the July 2025 reports.

Emvelo WEF boundary as per March 2025 Draft EIA Report (Figure 2 – Site Locality Map)

WEF boundary positions as given in Draft EIA Report dated July 2025 (Version 2)

3.3. The result of the situation as described in the foregoing points is that it is wholly unclear to I&APs as to what properties are affected by the proposed WEFs, what the extent of the respective proposed WEF sites actually is, how the two sites overlap in terms of infrastructure, WTGs and environmental constraints or sensitivities. Information which is materially deficient and reporting that is in such a state of disarray is not acceptable at the stage of a Draft EIA Report, which needs to be submitted as a Final EIA Report to the Competent Authority on 25 August 2025. It will not be possible to rectify these material omissions in that timeframe and any Final EIA Report submitted to the Competent Authority on this basis will be materially deficient.

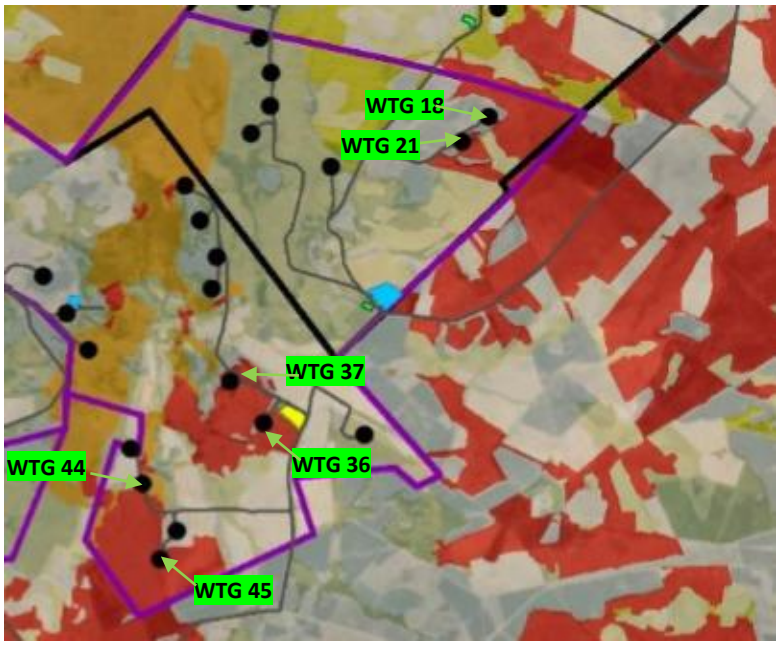
3.4. Based on responses from the EAP in the CRR, it appears the some of the WTGs may have been relocated / moved. These site layout changes are not detailed and the rationale for any such changes is not given in the project description. In fact, the Draft EIA Report is silent on the manner in which the layout has changed and the rationale behind these changes and which were made in response to environmental constraints or sensitivities. Such details and related information are central to determining if a concerted and authentic effort has been made to avoid adverse impacts, in accordance with the precautionary principle and the mitigation hierarchy.

3.5. Coordinates of the WTGs are not provided, and therefore reliance has to be placed on the figures (diagrams), to ascertain where the turbines and other infrastructure is located relative to environmental sensitivities. This makes it confusing for I&APs to appreciate if the impact assessment is informed by credible data. This is exacerbated by the fact that the figures provided by ERM in the March 2025 Draft EIA Report did not have labels on the WTGs because the WTGs are not numbered. This makes it exceedingly difficult for I&APs and the Competent Authority to correlate these figures with those in the July 2025 Draft EIA Report. The lack of WTG coordinate information undermines the ability of I&APs and the Competent Authority to establish whether the position of WTGs has changed in response to concerns about environmental sensitivities.

3.6. Given the foregoing concerns regarding the adequacy and accuracy of information relied on by the EAP and provided in the reports, no reliance can be placed on any statements about WTGs having been relocated / moved in response to noise, biodiversity sensitivities, cultural / heritage resource sensitivities and the like because spatial data shown on maps is confusing, boundaries have changed, the two sites overlap and diagrams and maps in reports have not been updated accordingly.

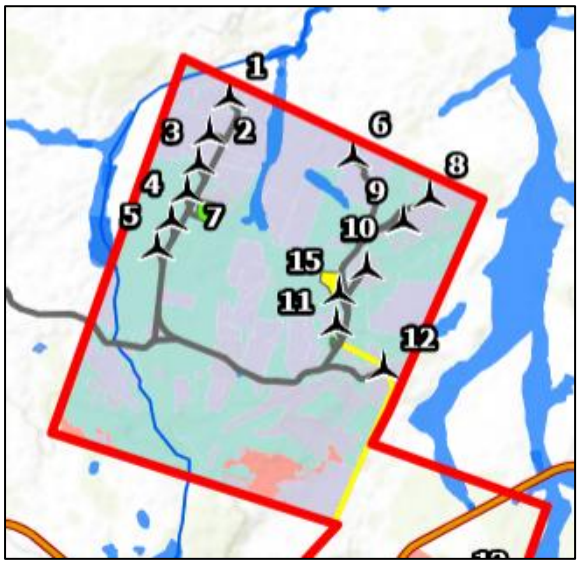
Assurances given in the CRR have no substance

3.7. In the CRR the EAP has offered assurances to concerned parties that WTGs have been moved / relocated away from sensitive areas. Unfortunately, there are instances where this contention is not borne out by the facts and data contained in the reports. Therefore it must be concluded that these assertions by the EAP must be treated with extreme caution by the Competent Authority.

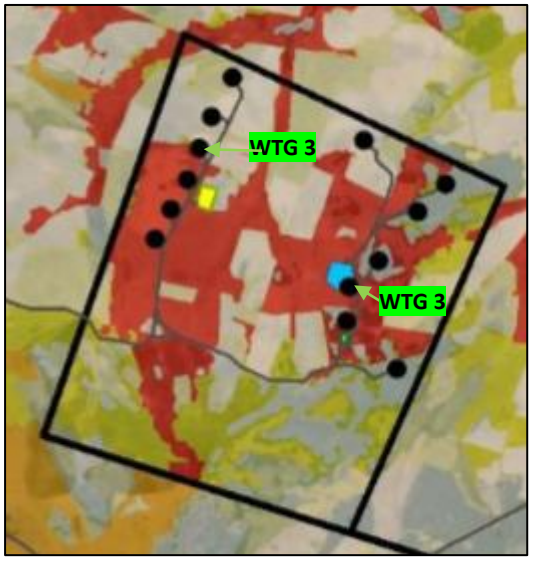


3.8. A specific example is the concern raised by DARDLEA about the location of WTGs in CBA: Irreplaceable areas, with specific mention of Turbine 45. In response the EAP has stated that

this turbine has been "relocated approximately 330 metres southward to ensure complete avoidance of the CBA: Irreplaceable area". Since the Figure 6 – Important Ecological Areas in the Draft EIA Report shows CBAs as a single entity (i.e. does not differentiate according to the CBA: Irreplaceable and CBA: Optimal categories as per the Mpumalanga Biodiversity Sector Plan (MBSP), it is difficult to verify this claim. The information is materially deficient and the Competent Authority, and I&APs are unable to determine – from the reports made available - if the claims made by the EAP are valid. There is too much uncertainty.



3.9. Accordingly, we considered the diagram on Biodiversity Offset Report prepared by WSP. This shows the CBA: Irreplaceable in accordance with the MBSP. It can be seen that in the case of the proposed Sheepmoor WEF, a number of WTGs fall within or right on the edge of CBA: Irreplaceable. WTG 45 remains located in CBA: Irreplaceable, despite the EAP's contention that it has been moved to completely avoid CBA: Irreplaceable.



3.10. The contradiction in the documentation is deeply concerning because it misrepresents the correct factual position on the ground. Furthermore, even if it was moved southwards as stated by the EAP, this would not resolve the situation, since CBA: Irreplaceable is present to the south of this turbine.

3.11. What is notable in the case of Sheepmoor is that there are other WTGs sited within CBA: Irreplaceable or on the edge thereof, besides WTG 45: Irreplaceable, namely WTGs 44, 36, 37, 21 and 18. A similar situation exists for Emvelo as can be seen from the WSP Biodiversity Offset Report – Figure 3-1.

WTGs located in CBA: Irreplaceable – Sheepmoor (extract from Figure 3-1 of the WSP Biodiversity Offset Report). According to the key associated with this diagram, red shading shows CBA: Irreplaceable.

3.12. The EAP states "the turbine and infrastructure layout has been revised in accordance with specialist recommendations, with a strong emphasis on avoidance of ecologically sensitive areas. All no-go areas identified by biodiversity specialists have been fully excluded from the final layout." (e.g. Sheepmoor CRR, page 24).

3.13. Concern was raised about WTG 15 being located in a Key Biodiversity Area (KBA) that is untransformed (page 15 Emvelo CRR). In reply the EAP states that WTG 15 was removed from the final layout. This is not the case! Examination of the extract from Figure 6 – Important Ecological Areas (from the figures volume attached to the July 2025 Draft EIA Report) shows that both WTG 3 and WTG 15 remain located in a CBA (green shading), albeit in a different position relative to the March 2025 Draft EIA Report. A construction camp is located next to the WTG and is also shown situated in a CBA. What is the explanation for this? Therefore, the relocation of WTG 15 does not seem to have offered any advantage from an avoidance of an adverse impact on biodiversity perspective. The lower image is extracted from the Biodiversity Offsets Report and it can be seen that both WTG 3 and WTG 15 are situated within CBA: Irreplaceable. Again, it appears that this is mere tick-box exercise by the EAP with no real intent to report accurately.

3.14. The status of the layouts that have been assessed by the EAP is unclear. Terminology is used loosely as shown in the examples below, taken from the July 2025 Draft EIA Report for the proposed Emvelo WEF. The same text is evident in the Draft EIA Report for the proposed Sheepmoor WEF, albeit that the page numbers are different. Examples include:

3.14.1. Page 9 of the Emvelo July 2025 Draft EIA Report under the topic Terrestrial Biodiversity, it is stated that "It is recommended that a final site walkdown be undertaken in order to inform the final layout design and inform micro-siting of footprints."

3.14.2. Yet the project description also references final layout design as not being finalised (page 2): "The proposed turbine footprints and associated facility infrastructure will cover an area of up to 185 ha after rehabilitation, depending on final layout design."

3.14.3. Then on page 13 on the topic of fauna, the following statement is made: "Final layouts of turbine placement, access roads, OHPLs, and other associated developments were provided by ERM on 30 January 2025. The final layout plans indicate that several wind turbines and access roads fall within areas of high faunal sensitivity" .

3.14.4. Page 28: "Prior to the submission of the final layout plan to the DFFE for approval….."

3.15. It is unclear as to what the final layout constitutes because as already noted, in the CRR the EAP makes reference to WTGs being moved in the "final layout". The reports are plagued with inaccuracies and contradictory statements. The credibility of the assessment process is doubtful as so many uncertainties prevail. IN this regard, the following questions arise:

3.15.1. If as noted by the terrestrial biodiversity specialist (for example), final layout plans were provided by ERM in January 2025, then is this the layout that was assessed for the purposes of the March 2025 Draft EIA Report? This is not clear at all from the reports made available to I&APs.

3.15.2. If concerns were raised by I&APs, specifically commenting authorities, about the layout plan presented in the March 2025 Draft EIA Report, and the EAP's response is that this has been resolved in the final layout, then which final layout is this? This is not clear at all from the reports made available to I&APs.

3.15.3. More importantly, why is there a disparity between the EAP's claim that WTGs and infrastructure has been moved / relocated (and thus, according to the EAP, the concerns about environmental sensitivities have been addressed). This is NOT the case. The figures presented in the July 2025 Draft EIA Report, which show definitively that this is not the case, with one or two exceptions (WTG 7 was moved due to the sensitivity of bird species 23).

3.15.4. Why is there reference to the need to do a walkover to develop a final layout and inform micro-siting of turbines and infrastructure, whereas the CRR creates the impression that micrositing has already been done?

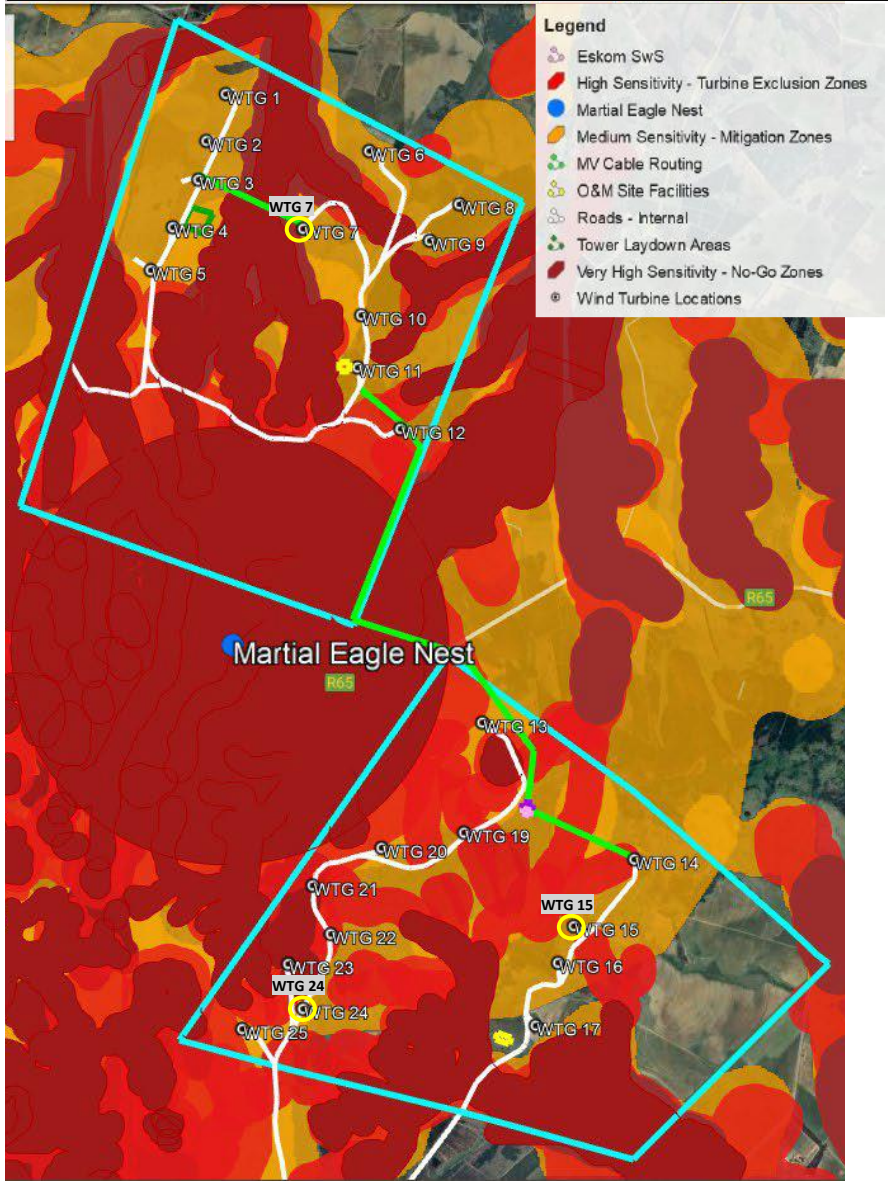
3.16. As evident from the foregoing discussion, as well as that in relation to avifaunal sensitivity, any assertion by the EAP that layouts have been changed, WTGs and infrastructure moved to avoid or reduce adverse impacts, are questionable. Such assertions must be interrogated by the Competent Authority and treated with caution. In fact, these claims cannot be relied upon and the manner in which information in this regard has been presented serves to compromise the entire EIA process. Moreover, it undermines the validity of significance ratings (over and above the weaknesses in the rating methodology highlighted in Section 4 of this document) pre-and post-mitigation.

4. INADEQUATE IDENTIFICATION AND ASSESSMENT OF IMPACTS

4.1. As noted in our previous comments (dated April 2025), the significance ratings of impacts reported by the EAP cannot be relied upon. It is inconceivable that in an environment that has so many highly sensitive environmental attributes, that not one single negative impact post-mitigation is rated more than being of 'moderate' significance. In general significance has been understated and this situation persists.

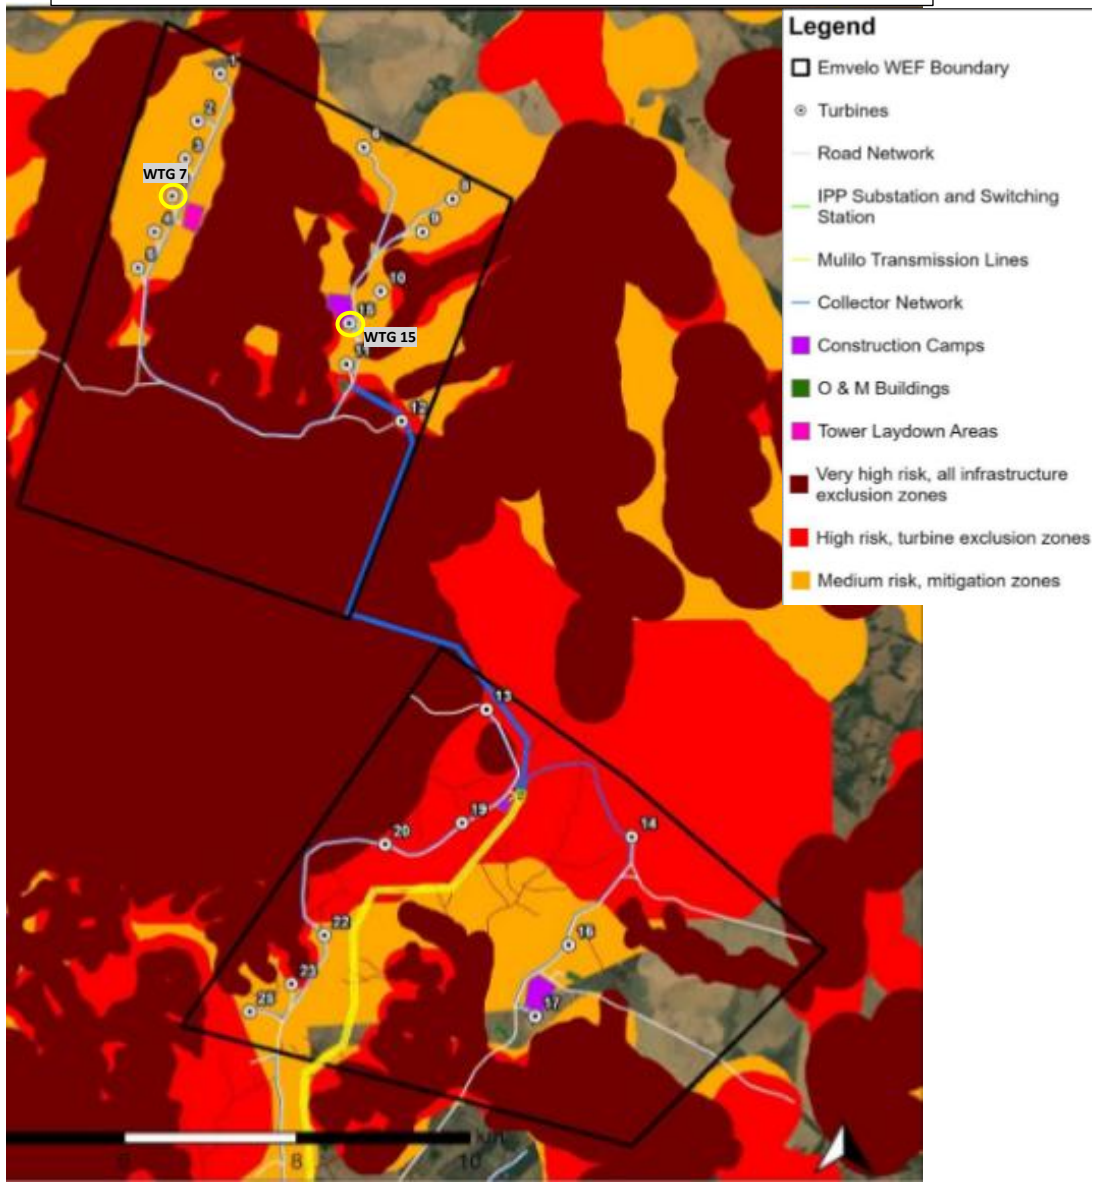
4.2. An example is the way the criterion "extent" is applied. To illustrate this point, avifauna is given as an example using the operational impact "Mortality due to Collisions with Turbines". The first problem is that all birds are considered as a single entity – there is no differentiation between Species of Conservation Concern versus other species. Where a species is listed globally as CE or E, then the extent of any impact that could cause mortality is a major concern at an international level and cannot be rated as medium in terms of extent. It is immediately apparent just from this single example of the criterion of "extent", that the result will be understatement of impact significance.

4.3. Impacts on policies and plans have not been assessed. For example, NPAES (National Protected Area Expansion Strategy) areas occur on the sites of both proposed WEFs. This is not shown on the sensitivity maps / diagrams. In addition, the impact on this strategy has not been assessed. Similarly, the potential impact of the proposed projects on conservation targets and objectives such as those expressed in the or on MBSP have not been assessed. There is also no indication that these types of policies, plans and programmes influenced impact significance rating.



4.4. The figures overleaf (extracted from Figure 39 of the Avifaunal Specialist Study) do show that WTG 7 was moved (in response to the sensitivity of Species 23). Relocation of WTG 15 as described in point 19 would seem to be disadvantageous in the context of Martial Eagle sensitivity. It is located closer to the Martial Eagle buffer (May 2025 Avifaunal Specialist Study) and also closer to the "Very high risk – all infrastructure exclusion zone". It is not known to what extent the relocation of WTG 15 was considered in the May 2025 Avian Specialist Study as no reference could be found to a specific discussion in this regard. Note that changed turbine positions are shown in yellow circles in the diagrams overleaf.

4.5. There are several WTGs that are still located within the Martial Eagle Turbine Exclusion Zone. These are WTGs 12, 13, 14, 19 and 20 are located. This was raised in the comments on the Draft EIA Report dated March 2025 (page 20 Emvelo CRR). In response the EAP states the following: "Noted. WTGs 12, 20 and 21 have been moved outside of the Avifaunal Turbine Exclusion Zone (Martial Eagle nest buffer), and WTG 13 has been micro sited to be located further away with the rotor swept area also not intersecting with this zone. This is simply not the case, which means this response by the EAP is **factually incorrect**. In fact, the specialist notes in his revised report (May 2025 – page 106) that these turbines need to be moved. Accordingly, the EAP has misrepresented the situation with regard to an extremely sensitive species.



4.6. Further to the above, fatality rate decreases described in the Avifaunal Specialist Study (Section 5.8.8) are open to question. It is unclear how the fatality rate for the Martial Eagle,

for example, can be predicted to reduce as much as described in of the specialist study, especially as the reduction of >50% is attributed to project layout changes. In the absence of specific details of what was changed so as to result in this predicted fall in fatality rates, together with clear diagrams showing 'before' and 'after' layouts, this conclusion cannot carry a high degree of certainty. This is particularly as the recommended buffer zone for Martial Eagles has not been adhered to (5-6 km not 2.5 km radius). Moreover, the layout itself does not appear to have altered so significantly relative to Martial Eagle sensitive areas so as to point to a substantial reduction in the threat of fatality. The following diagrams from the Avifaunal Specialist Studies provided with the Draft EIA Reports of March and July 2025 show that it is exceedingly difficult to discern layout changes that may have been in response to avifaunal sensitivities.

Combined Avian Sensitivity – Proposed Emvelo WEF (extract from Fig. 3.9 of February 2025 specialist study included in March 2025 Draft EIA

Combined Avian Sensitivity – Proposed Emvelo WEF (extract from Fig. 3.9 of May 2025 specialist study included in July 2025 Draft EIA Report

5. INADEQUATE APPLICATION OF THE MITIGATION HIERARCHY

Avoiding avoidance – the pinnacle of the mitigation hierarchy

5.1. One just has to consider the impact tables where one of the questions is: "Can impact be avoided, managed, or mitigated?" realise that the impact assessment methodology is based on a misconception of the mitigation hierarchy. The specialist response to the question "Can impact be avoided, managed, or mitigated?" is either "yes" or "no". There is no requirement to specify which mitigation strategy is being applied. Avoidance is different to management / mitigation, but the EAP makes no account for this. It is important to know whether the impact can be avoided as opposed to whether it can be mitigated. This ought to be explicitly explained by the EAP, but the EAP has failed to provide a rational explanation.

5.2. Avoidance is preferred and should always be considered before any other options in terms of the sequence of tiered steps mandated by the impact mitigation hierarchy. Definitively proving that avoidance has been implemented in accordance with the mitigation hierarch is something the EAP has categorically failed to establish.

5.3. The EAP's trend and preferred methodology – as shown in the Draft EIA Report - is to avoid 'avoidance' as the primary means for preventing adverse impacts in terms of the hierarchy. The EAP's approach flies in the face of IEM and the mitigation hierarchy because avoidance is assumed but not reflected in the project documentation. When working in such a sensitive environment, such as the sites of the proposed projects, it goes without question that AVOIDANCE should be top priority and a critical threshold to adhere to BEFORE proceeding to the following stages of the mitigation hierarchy. The role of the EAP is to ensure development is undertaken in a manner that ensures the interests of the biophysical environment and affected communities. This is an enormous responsibility and cannot be fulfilled if concerns raised by I&APs and conservation authorities are downplayed and effectively ignored. The impact assessment and public participation processes are materially inadequate.

5.4. Instead of avoiding areas of high sensitivity the EAP recommends pre-commencement flora relocation and faunal relocation (see for example page 384 Draft EIA Report). This is unacceptable and illustrative of a fundamentally defective approach to impact assessment and management. Areas of high sensitivity ought to be avoided outright in terms of the mitigation hierarchy. This has NOT been done.

5.5. There is no clarity of which species will be affected or whether they are good candidates for relocation (i.e. is the success of this proposed mitigation measure proven). The proposal to relocate species has associated impacts and these have NOT been assessed. In a scenario where relocation is unavoidable (i.e. all other options in terms of the mitigation hierarchy have been applied and exhausted) – **this constitutes a project impact and is not solely a proposed mitigation measure.**

5.6. It is stated "Several burrowing faunal species are present and will allow for relocation of less mobile species, although most faunal species in proximity are likely to vacate the area once

earth moving equipment commences clearing and construction, however some species may require manual relocation." Firstly, the way this proposal is framed is muddled / does not make sense. It reads like some sort of circular argument. Secondly, the impacts of relocation have not been assessed. Thirdly, once earth-moving equipment moves in, the project has commenced – which does not tie up with the proposed pre-commencement relocation of the sensitive species.

5.7. Inadequate thought has been given to relocation of plant and animal species, which results in the following unsubstantiated, bland and rather meaningless statement by the EAP: "They are relocated into a suitable habitat and protected from further damage and all disturbances to aid their re-establishment."

5.8. There are too many unanswered questions to place any reliance on this relocation proposal:

5.8.1. Have suitable alternative habitat locations been identified for relocation purposes? How far away are these and is the location accessible for this purpose? These questions are unanswered.

5.8.2. What is the impact of the faunal species that might be relocated? What about their wellbeing? These questions are unanswered.

5.8.3. How will they be caught so as to avoid trauma? Are they territorial species and if so, how will they be introduced into a new territory? How will faunal species in the new territory react? These questions are unanswered.

5.8.4. Has a faunal relocation expert been consulted? Where is the specialist input on relocation? These questions are unanswered.

5.9. The key priority and statutory obligation for an EAP is to determine whether a proposed project can respond to the environmental constraints present at the proposed location. This is the most important assessment and guidance that an EAP can provide. Instead, in this case, focus is placed on mitigation such as relocation of sensitive flora and fauna. It appears that little or no thought is given to the recipients or receiving environment of this relocation, as if one is dealing with environmental impact management is akin to dealing with inanimate objects.

5.10. There is also a disproportionate reliance placed by the EAP on reconsideration of WTG positions following a post-authorisation walkthrough. The question that has not been answered by the EAP is this: Why can such a walkthrough not be conducted during the EIA process when the specialists have been on site? Emphasis is placed on how much field work has been done, so why did this not include detailed examination of proposed WTG locations? For example (page 87 of the Emvelo CRR) concern is raised about the location of turbines and roads within Yellow-breasted Pipit habitat, contrary to the avifaunal specialist's recommendations. The EAP's response is "All WTGs were removed from Yellow-breasted Pipit habitat with the exception of WTG 23 that still appears to be fringing on a high-risk area as identified for the Yellow-breasted Pipit. It is recommended that this turbine position be

reconsidered following the avifaunal walkthrough, post-EA (should such EA be granted) prior to construction." It seems that WTG 31 (Sheepmoor) is also located on the edge of this bird's habitat.

5.11. There is reference to turbines having been micro-sited out of certain areas. See for example the Emvelo CRR (page 20) in relation to Martial Eagle. This raises the obvious question as to why micro-siting was not completed for all bird species and other environmental sensitivities. The maps are such that it is extremely difficult to discern whether the positions of turbines have changed, and this is due to lack of information on coordinates as mentioned elsewhere in this report. An explanation as to how the siting of WTGs was done is required. Was this done in field? When and how was micro-siting done? Were the edges between sensitive habitats and WTG positions verified in the field?

5.12. It is strange that if there is such precision about blade sweep and how far it extends and that it does not impinge into sensitive areas (see page 19 and 20 of Emvelo CRR) that more detailed diagrams / maps are not provided at a scale that clearly shows the difference between the before and after changes that have been made to the layout. Another example (page 36 of the Sheepmoor CRR) of this type of feedback is: "The Sheepmoor WEF has undergone significant layout refinement to avoid high-sensitivity areas, particularly Critical Biodiversity Areas (CBAs) and known flight paths of key species." Again, is one looks at the figures, it is extremely difficult to see any material difference in the layout.

5.13. Given the foregoing points, no reliance can be placed of assurances that the layout has been substantially changed and that micro-siting has been conducted. If this were the case, then the information presentation would be clearer, especially spatial information. Precise coordinates would be given of WTG positions before and after relocation, for example.

Misunderstanding of legal obligations – alien invasive legislation

5.14. Clearing of alien invaded areas is offered as a trade-off, at a ratio of 1:3 for direct loss of natural grassland habitat (as a trade-off or offset), in conjunction with other mitigation proposed by the terrestrial biodiversity specialist. This proposal is repeated many times in the Draft EIA Report for both proposed WEFs (e.g. page 32 Emvelo Draft EIA Report of July 2025). This proposal cannot be accepted as a trade-off or an offset. The reason is that this proposal is attached to the site of the proposed development, and the influence / impacts are not confined solely to the development footprint.

5.15. Furthermore, alien vegetation control is a legal requirement under the Alien and Invasive Species Regulations (GNR 1020 of 25 September 2020). As such, the meeting of a legal obligation cannot be used as a trade-off. Even if the WEF owner is not the same party as the landowner, this applies, because the WEF is being operated on that land. Thus, under the duty of care obligations under NEMA, the WEF operator is required to fulfil alien vegetation control obligations.

5.16. It may be argued that the WEF operator has no obligation to control alien invasive vegetation, especially that present prior to development. This is a weak argument because one of the

impacts associated with disturbance caused by the proposed development is the possible spread of alien invasive vegetation.

Misuse of biodiversity offsets

5.17. The proposed offset does not meet the required outcomes of the National Biodiversity Offset Guideline of 2023, which are that the offset outcomes must be ***practically measurable on the ground***. Importantly an offset must ensure that:

5.17.1. biodiversity is secured in the long term through the protection and appropriate management of ecosystems and species;

5.17.2. efforts to protect biodiversity in the long term contribute to the expansion of South Africa's protected area network, and are focused in areas identified as biodiversity priorities, with particular emphasis on the consolidation of protected areas and biodiversity priority areas and securing effective ecological links between priority areas; and

5.17.3. it contributes to the long-term security of biodiversity priority areas and maintains or improves their ecological condition, thereby resulting in tangible and measurable positive outcomes for biodiversity conservation 'on the ground'.

5.18. Internationally, research, capacity building, training and other activities are not recognised as 'offsets' but can be used to support, expedite, improve or bolster the outcomes required of an offset.

5.19. The offset report proposes various measures to deal with residual impacts on birds. Area-based offsets are not feasible; several offsite actions have been proposed in an effort to achieve no net loss of these species. How no nett loss of bird species through these measures is to be achieved is wholly unclear. Furthermore, since WEFs pose a threat of bird deaths the loss of a single bird within the category of a species categorised as Critically Endangered or Endangered is one too many and pushes the species ever closer to a tipping point.

5.20. 13.7 ha of the 31 ha total residual impacts are in CBA 1 which is, by definition, **IRREPLACEABLE** and constitute a **FATAL FLAW** as noted in the national offset guideline. i.e. 44% of the proposed footprint. Also, it is in a NPAES focus area (Fig 3.1 of the WSP Biodiversity Offset Report).

5.21. **No assurance that land can be secured for conservation**, and **no assurance of long-term protection of a possible offset area is provided**. There is passing mention of 'may' look at conservation servitudes, but that is all." To suggest that Mulilo can motivate to the lessor that the offset plan is part of "maintenance and repairs" is wholly unacceptable and nonsensical.

5.22. **Furthermore, suggesting that target areas be identified in the context the existing site due to having lease agreements in place is counter to the intention of offsets. This land is within**

the proposed project's sphere of influence – so it is in fact not an offset as applied internationally and as understood in the aforementioned national guideline.

5.23. There is no clarity on responsibility for managing the offset area(s) (i.e. who would implement the offset and do the work) and covering costs of the offset, and duration of liability. Talking about clearing of alien species 'in a (questionable) ratio of 1:3' as a 'trade-off or offset' is nonsense. Any offset site would need to be cleared of alien species as an integral part of its management.

5.24. Of the **proposed offset measures for birds** (Section 10.2 in Biodiversity Offset report) – only the bird flight diverters may be acceptable BUT evidence that this would translate into on-the-ground outcomes is required (i.e. improvement in bird populations commensurate with expected residual impacts/ reduction in numbers due to electrocution/ collision with turbines/ powerlines). These outcomes must be directly linked to the affected species. Furthermore, no basis is given for specifying 5000 bird diverters every 10 years.

5.25. Support of research programmes are not recognised as an offset.

5.26. All of the items listed are in fact what a responsible corporate citizen ought to be doing and therefore do not constitute a praiseworthy offset (see point 53 below), particularly in circumstances where the mitigation hierarchy has not been applied. The first or top priority in the mitigation hierarchy is to avoid the adverse impact in the first place. This is precisely the mitigation approach that has been avoided in the EIA process for these proposed WEFs. Avoidance would mean removing any WEFs that is within away from bird sensitive areas on the basis of the precautionary principle – meaning do more than the minimum. For example, if there is a general guideline buffer applicable to nest areas, then application of the precautionary principle would mean adding to this buffer, because of the uncertainties about bird movements, for example.

5.27. The use of an offset demonstrates that there are residual adverse impacts, which means that the project has significant adverse impacts associated with it. It is not proactive compliance as espoused by the EAP. "This BOR is not a reactive add-on; it reflects a proactive compliance, demonstrating that the project has embraced its environmental responsibilities. Significant resources, technical input, and time were invested to ensure the offset plan would stand up to scrutiny and deliver real conservation value. It is a key part of what gives this project its integrity, and the applicant is proud to include it as a cornerstone of the DEIR submission. It should provide the competent authorities with a clear assurance that residual impacts have not only been recognised, but systematically addressed, avoided where possible, and responsibly offset where unavoidable." Besides the fact that the foregoing paragraph is verbiage, it is also factually incorrect. This type of language is wholly inappropriate – the language is not objective and compromises the independence of the EIA process.

5.28. Additional comments and concerns regarding the Offset Report prepared by WSP include:

Re: Section 3.1.2 PRIORITY AREAS FOR PROTECTED AREA EXPANSION

5.28.1. How has this section influenced the need for and design of any offset? This information would have and should have been evident during project planning and should have triggered upfront offset development at the earliest stages of the design process. What was this not investigated by the EAP before the 11th hour of the EIA process?

Re: 3.2.1 ECOLOGICAL IMPORTANCE OF VEGETATION COMMUNITIES IN THE LSA

5.28.2. The applicable Guideline suggest that impacts on CBAs should be AVOIDED AT ALL COSTS, unless the CBA can be shown to be inaccurately mapped or otherwise wrongly determined. The actual drivers of why the area is designated a CBA are important in terms of understanding the impact, requisite offset (if possible) and offset design to accommodate the feature driving CBA.

Re: Figure 3-7 - Sheepmoor Vegetation Sensitivity

5.28.3. It is curious (and inexplicable) to note that the areas in green are mapped as only moderate sensitive - although from an avifaunal perspective many areas are rated High or VERY HIGH. Offsets must synthesize the full array of features to derive a trigger but this has not been undertaken by the EAP.

Re: Section 5 AQUATIC BIODIVERSITY OVERVIEW

5.28.4. It is not clear whether there are any significant impacts on wetland systems (for instance from stream crossings by access roads or buried power lines) and whether these may trigger wetland offsets? This is unresolved and unanswered. The gaps in information and inadequacy of the assessment and it is not possible for the Competent Authority to render an informed decision on such impacts.

Re: Section 6.1.2 FLORA

5.28.5. EAP to confirm whether this is the first time a footprint figure has been made available during the EIA process. If so, why is this information made available at the 11th hour only?

5.28.6. There is no table of impact areas by feature, with a clear indication of what ratio should be applied. In order to determine a final offset quantum that can be audited for compliance monitoring the relevant information is not tabled. How much invaded area needs to be cleared? This is not clear from the reports. How is it to be rehabilitated to secondary grassland? This is not clear from the reports. Does this qualify as an acceptable offset for loss of intact grassland? If so, why? Again, this is not clear from the reports.

5.28.7. There is no map to determine whether it is feasible compensate for loss of secondary grassland in corridors between intact patches that are ESA designated – but the EAP states:

"this impact to negligible levels with only a very small proportion of the footprint occurring in or near higher sensitivity areas. Very High Sensitivity or No- Go habitat has largely been avoided and reduced to an acceptable level."

5.28.8. The above contradicts what the Avifauna report says or the fact that there are impacted CBAs and ecological corridors and processes. only valid for narrow vegetation lens. What is the total footprint of these areas impacted? Who is able to determine whether the impacts significance is acceptable without the material underlying data which has not been made available?

Re: Section 6.1.3 FAUNA

5.28.9. Agreed. This requires a clear and compensatory offset. i hope it still is to be clarified how much and where? could the OHPL be constructed without a service road? It seems unlikely

5.28.10. In this finely dissected landscape, with no-go areas immediately adjacent to low sensitivity, micro-siting would seem vital to have been completed before arriving at an impact statement and an estimation of footprint and offset liability. This is a key and material flaw in the entire EIA process. This weakness in impact assessment methodology flies in the face of IEM and the mitigation hierarchy.

5.28.11. The report relies on an indefinable and this un-auditable requirement and is fatally flawed.

Re: Plant Species page 410

5.28.12. Any loss of intact or degraded grassland habitat in corridors or wetland catchments cannot be rated as a positive impact!

Re: Table 9-2 – Terrestrial habitat offset targets

5.28.13. How does this relate to the 180 ha indicated in the report above? This is an unacceptable impact. fully 40% of the impact is in CBA1 ?

Re: Section 10 CANDIDATE OFFSET SITES

5.28.14. There is no candidate list, or any credible analysis of the contribution of each? do sufficient sites exist? are the landowners amenable to having their activities curtalied?

5.28.15. There is no evidence these lease conditions include restriction of farming activities and proactive biodiversity management. When were they signed, and has proof been submitted to the authorities?

5.28.16. Much of the assessment is entirely theoretical. Actual offset sites need to be identified and the specifics of their rehabilitation are determined to assess functional gains before

a decision can be made. More specifics would have helped the decision maker here regarding the biodiversity impacts

5.28.17. Rehab of grasslands is difficult and expensive, and often incomplete/inconclusive. restoration is likely impossible - especially to achieve prior diversity levels and structure, and keep invasive and alien species out.

Re: Section 10.1 SIGNED LEASE AGREEMENTS

5.28.18. The mooted lease agreements are likely to be contested by the landowners. A dedicated offset lease agreement and servitude - with accompanying management plan setting out the requisite outcomes - should have been concluded with the sites but this has not been done. . All of these proposed offset areas will be adjacent to the WEF/ WTG and this is questionable in terms of offset efficacy.

5.28.19. There is little indication of competing interests which might undermine potential offset efficacy e.g. Mining & Prospecting Rights, and the limits that these rights might impose on the applicants' ability to attain offset outcomes

Re: Section 11 10.2 OFFSITE ACTIONS FOR PRIORITY BIRD SPECIES

5.28.20. None of the actions listed qualify as offsets, or are so insufficiently described as to be so vague and meaningless that it is impossible to link the action directly to an impact (which methodology is expressly prohibited by the Offset Guideline). The reason being that the impact is not quantifiable and is unauditable based on the available information.

Re: Section 11 RECOMMENDED CONDITIONS FOR ENVIRONMENTAL AUTHORISATION

5.28.21. The quantum needs to be specified here, but it isn't quantified. The final status and/or protection and management regime need to be confirmed but this information has not been made available

5.28.22. There is insufficient information to demonstrate that the landowner has consented to the proposed arrangement. It is also not clear how certain this outcome is and whether this is covered in the lease conditions.

Re: Section: AFFECTED TERRESTRIAL HABITATS

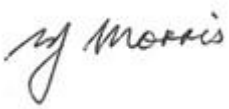
5.28.23. This assessment is meaningless unless attached to a specific infrastructure element, which it is not. In the circumstances, the DFFE is unable to determine accurately what the offset liability is should they choose to only approve a portion of the project

The reliance on micro-siting

5.29. Whilst post-approval micrositing is applied internationally in the wind energy sector, this is

within very specific limitations. According to Scottish Natural Heritage[1], for example, the siting of wind turbines in small incremental distances and is used at two main stages of wind farm development:

5.29.1. Firstly, during the design stage to ensure that turbine layout is satisfactory from key viewpoints and achieves the design objectives.



5.29.2. Secondly, during the construction phase of a project, where previously unexpected conditions are encountered on site.

5.30. Provision for micrositing is normally covered by a specification in the EIA Report which can then be included in the conditions in the approval. This serves to set a limit within which micrositing is permitted and normally limits this to 50-100m from the specified (approved) turbine location. This information ought to be known to ERM South Africa, since exactly this approach is applied by the company in the UK (for example Crosbie Wind Farm.[2]

5.31. From the foregoing information it can be seen that micrositing is not to be applied in a non-specific manner. It is recognised that some flexibility is required in final design stages and also to allow for unforeseen circumstances during construction. It is standard and accepted practice internationally to specify a distance limitation within which micrositing is permitted. This must of course be included in the project description and included in the impact assessment. This way, I&APs and the Competent Authority are provided with a full picture of the potential development footprint (including the micrositing zone) and the associated footprint. More importantly, it means the Competent Authority has full information and can include a specific zone for each WTG within which micrositing is permissible. Hence, this is clear and known to the Competent Authority upfront from the provision of this information in the EIA Report, instead of being faced with an unknown quantity in terms of

Dear Ms Gopaul

COMMENTS ON THE AMENDED DRAFT ENVIRONMENTAL IMPACT ASSESSMENT REPORT FOR THE PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The amended draft Environmental Impact Assessment Report (EIAr) dated July 2025 and received by this Department on 15 July 2025 refers.

This letter serves to inform you that the following amendments and information must be included in the final EIAr

(a) General Comments

1. The final EIAr must comply with all comments on the draft scoping report signed on 20 September 2024; conditions of the acceptance of the scoping report signed on 19 November 2024; the comments on the draft EIAr signed on 10 April 2025; as well as these comments on the amended draft EIAr, and must address all comments received for the DSR, FSR, draft EIAr and amended draft EIAr.

The processing of personal information by the Department of Forestry, Fisheries and the Environment is done lawfully and not excessive to the purpose of processing in compliance with the POPI Act, any codes of conduct issued by the Information Regulator in terms of the POPI Act and/or relevant legislation providing appropriate security safeguards for the processing of personal information of others.

2. It is noted that the proposed ideal location of the activity is within the amended development footprint, which is still outside of the approved site as contemplated in the accepted scoping report. This results in the process being procedural flawed in terms of legislative requirements under EIA Regulations 2014, as amended. The concerns raised and recommendations in the email sent to you from this Department, dated 17 February 2025 still apply.
3. The Avifaunal Specialist Assessment Report for the proposed Emvelo Wind Energy Facility has not been included as part of the amended DEIAr.
4. Please ensure that all information is included, where the draft EIAr refers to missing information that will be included in the final EIAr or any information that will be confirmed in the final EIAr.
5. Should a specialist recommend specific mitigation measures, these must be clearly indicated.

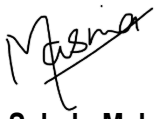
(b) Public Participation Process

1. Please ensure that comments from all relevant stakeholders are submitted to the Department with the final EIAr, including comments from the relevant sections of this Department.
2. All issues raised and comments received during the circulation of the SR, draft EIAr and the amended draft EIAr from registered Interested and Affected Parties (I&APs) and organs of state, as listed in your I&APs Database, and others which have jurisdiction in respect of the proposed activity must be adequately addressed and included in the final EIAr.
3. Proof of correspondence with the various stakeholders must be included in the final EIAr. This must indicate that this amended draft EIAr has been subjected to 30 days public participation process, stating the start and end date of the PPP.
4. Evidence that all identified and relevant competent authorities have been given an opportunity to comment on the amended draft EIAr for the proposed development must be provided with the final EIAr. Should you be unable to obtain comments, proof must be submitted to the Department of the attempts that were made to obtain comments.
5. Copies of the original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity must be submitted with the final EIAr.
6. In the final EIAr, the Comments and Response Report (CRR) must include all historical comments and issues raised to date.

General

Please also ensure that the final EIAr includes the period for which the Environmental Authorisation is required and the date on which the activity will be concluded as per Appendix 3 of the NEMA EIA Regulations, 2014, as amended.

You are further reminded to comply with Regulation 23(1)(a) of the NEMA EIA Regulations, 2014, as amended, which states that: *"The applicant must within 106 days of the acceptance of the scoping report submit to the competent authority -*
(a) an environmental impact assessment report inclusive of any specialist reports, an EMPr, a closure plan in the case of a closure activity and where the application is a mining application, the plans, report and calculations contemplated in the Financial Provisioning Regulations, which must have been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received, including any comments of the competent authority."



Should there be significant changes or new information that has been added to the EIAr or EMPr which changes or information was not contained in the reports or plans consulted on during the initial public participation process, you are required to comply with Regulation 23(1)(b) of the NEMA EIA Regulations,

2014, as amended, which states: *"The applicant must within 106 days of the acceptance of the scoping report submit to the competent authority – (b) a notification in writing that the documents contemplated in sub-regulation 1(a) will be submitted within 156 days of acceptance of the scoping report by the competent authority or where regulation 21(2) applies, within 156 days of receipt of the application by the competent authority, as significant changes have been made or significant new information has been added to the documents, which changes or information was not contained in the original documents consulted on during the initial public participation process contemplated in sub-regulation (1)(a), and that the revised documents contemplated in sub-regulation 1(a) will be subjected to another public participation process of at least 30 days".*

Should you fail to meet any of the timeframes stipulated in Regulation 23 of the NEMA EIA Regulations, 2014, as amended, your application will lapse.

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Yours sincerely

Dr Sabelo Malaza
Chief Director: Integrated Environmental Authorisations

PER E-MAIL

Dear Ms Gopaul

COMMENTS ON THE AMENDED DRAFT ENVIRONMENTAL IMPACT ASSESSMENT REPORT FOR THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The amended draft Environmental Impact Assessment Report (EIAr) dated July 2025 and received by this Department on 15 July 2025 refers.

This letter serves to inform you that the following amendments and information must be included in the final EIAr

(a) General Comments

1. The final EIAr must comply with all comments on the draft scoping report signed on 20 September 2024; conditions of the acceptance of the scoping report signed on 19 November 2024; the comments on the draft EIAr signed on 10 April 2025; as well as these comments on the amended draft EIAr, and must address all comments received for the DSR, FSR, draft EIAr and amended draft EIAr.

The processing of personal information by the Department of Forestry, Fisheries and the Environment is done lawfully and not excessive to the purpose of processing in compliance with the POPI Act, any codes of conduct issued by the Information Regulator in terms of the POPI Act and/or relevant legislation providing appropriate security safeguards for the processing of personal information of others.

2. It is noted that the proposed ideal location of the activity is within the amended development footprint, which is still outside of the approved site as contemplated in the accepted scoping report. This results in the process being procedural flawed in terms of legislative requirements under EIA Regulations 2014, as amended. It is recommended that the Sheepmoor WEF application be withdrawn, and a new application, with the amended proposed development site, be resubmitted to the Department.
3. Please ensure that all information is included, where the draft EIAr refers to missing information that will be included in the final EIAr or any information that will be confirmed in the final EIAr.
4. Should a specialist recommend specific mitigation measures, these must be clearly indicated.

(b) Public Participation Process

1. Please ensure that comments from all relevant stakeholders are submitted to the Department with the final EIAr, including comments from the relevant sections of this Department.
2. All issues raised and comments received during the circulation of the SR, draft EIAr and the amended draft EIAr from registered Interested and Affected Parties (I&APs) and organs of state, as listed in your I&APs Database, and others which have jurisdiction in respect of the proposed activity must be adequately addressed and included in the final EIAr.
3. Proof of correspondence with the various stakeholders must be included in the final EIAr. This must indicate that this amended draft EIAr has been subjected to 30 days public participation process, stating the start and end date of the PPP.
4. Evidence that all identified and relevant competent authorities have been given an opportunity to comment on the amended draft EIAr for the proposed development must be provided with the final EIAr. Should you be unable to obtain comments, proof must be submitted to the Department of the attempts that were made to obtain comments.
5. Copies of the original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity must be submitted with the final EIAr.
6. In the final EIAr, the Comments and Response Report (CRR) must include all historical comments and issues raised to date.

General

Please also ensure that the final EIAr includes the period for which the Environmental Authorisation is required and the date on which the activity will be concluded as per Appendix 3 of the NEMA EIA Regulations, 2014, as amended.

You are further reminded to comply with Regulation 23(1)(a) of the NEMA EIA Regulations, 2014, as amended, which states that: *"The applicant must within 106 days of the acceptance of the scoping report submit to the competent authority -*
(a) an environmental impact assessment report inclusive of any specialist reports, an EMPr, a closure plan in the case of a closure activity and where the application is a mining application, the plans, report and calculations contemplated in the Financial Provisioning Regulations, which must have been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received, including any comments of the competent authority."

Should there be significant changes or new information that has been added to the EIAr or EMPr which changes or information was not contained in the reports or plans consulted on during the initial public participation process, you are required to comply with Regulation 23(1)(b) of the NEMA EIA Regulations, 2014, as amended, which states: *"The applicant must within 106 days of the acceptance of the scoping report submit to the competent authority – (b) a notification in writing that the documents contemplated*

in sub-regulation 1(a) will be submitted within 156 days of acceptance of the scoping report by the competent authority or where regulation 21(2) applies, within 156 days of receipt of the application by the competent authority, as significant changes have been made or significant new information has been added to the documents, which changes or information was not contained in the original documents consulted on during the initial public participation process contemplated in sub-regulation (1)(a), and that the revised documents contemplated in sub-regulation 1(a) will be subjected to another public participation process of at least 30 days".

Should you fail to meet any of the timeframes stipulated in Regulation 23 of the NEMA EIA Regulations, 2014, as amended, your application will lapse.

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Yours sincerely

Dr Sabelo Malaza
Chief Director: Integrated Environmental Authorisations
Department of Forestry, Fisheries and the Environment

EXTERNAL MESSAGE

Goodday Lucien

To avoid any confusion, I just want to inform ERM that I have submitted 3 reports with comments on the relevant draft EIA reports for the Mulilo Sheepmoor and Emveli WEFs. Each report with comments cover both the Sheepmoor and Emvelo proposed WEFs and are listed below for clarity

- Comments date 10/04/2025 compiled by Richard Summers attorney on the March 2025 draft EIA report (Submitted on 10/04/2025)
- Comments date 15/08/2025 compiled by Richard Summers attorney on the July 2025 draft EIA report (Submitted on 15/08/2025)
- Comments date 14/08/2025 compiled by Josua Meyer on the July 2025 draft EIA report (Submitted on 15/08/2025)

All three reports with comments were provided within the applicable commenting period timeframe of 30 days.

Richard Summers Attorney was appointed by myself and he submitted the comments on behalf of Josua Meyer as a registered I&AP.

All comments submitted are supplementary to each other and are NOT to be taken as substituting the other one.

Please contact me if anything remains unclear.

Regards

Josua Meyer

EXTERNAL MESSAGE

Dear Lucien

Just want to get the records straight without getting into an informal debate

1 - 4 : Correspondence

- Request info from ERM, Mr Lucien Barbeau, on 17/12/2024 at 11h04.

  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.

  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35

  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?

  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.

  Meeting took place on 4/08/2025.

  Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.

Repeat request during meeting of 4/08/2025

Received info only on 12/08/2025

Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59

Repeat request for tagged data from ERM on 29/03/2025 at 11h44

Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.

Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.

Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct

The issue is not who did wrong but is the tagging done with a valid permit.?

If not, then it is illegal and that also implies for the data obtained by the unlawful act.

What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?

Very dangerous and controversial approach..

We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

>
> MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs, and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.
>
> ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.
>
> **2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?**

ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.

While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.

We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the

tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case. Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives, identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Kind regards,

ERM

EXTERNAL MESSAGE

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

Nevertheless the 6 or 7 th August 2025 is fine with us.

Will appreciate it if we can meet on my farm.

We intend to be three (3) I&AP

Regards

Josua Meyer

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Hi Lloyd,

Please note that we have received comments and concerns from an I&AP who operates a landing strip near the proposed development.

These comments were originally submitted on 22 April after the previous Draft EIA Phase PPP period. The I&AP has now resubmitted the same comments during the current PPP period.

Given the nature of the concerns raised, and that the submission has come via the I&AP's legal representative, we kindly request that the Mulilo legal team review the comments and provide any necessary input.

EXTERNAL MESSAGE

Dear Sir/Madam

We have briefly perused the draft EIA report and have been unable to find any reference to the comment submitted by us on the instructions of our client, a copy of which is attached to this email.

Kindly refer us to the relevant pages of the draft report which deal with our client's comments?

We further note from the draft report that a formal application has been lodged with Air Traffic and Navigation Services (ATNS) for a formal obstacles assessment to be conducted. Kindly furnish us with a copy of this application and all communications to and from ATNS relating thereto.

We look forward to hearing from you as a matter of urgency.

EXTERNAL MESSAGE

Dear Lucien

Just want to get the records straight without getting into an informal debate

1 - 4 : Correspondence

- Request info from ERM, Mr Lucien Barbeau, on 17/12/2024 at 11h04.
  Still no response ?

- First request for meeting to applicant, mr Johans van Wyk, on 19/2/2025 at 12h35.
  Applicant, mr Johans van Wyk, reject request on 19/02/2025 at 15h35
  First formal request for meeting through ERM on 16/4/2025 at 03h24. No response ?
  Request again for meeting through ERM, Mr Lucien Barbeau, on 18/07/2025 at 16h51.
  Meeting took place on 4/08/2025.
  Almost 8 months later!?

- Requested on 16/06/2025 for official documentation concerning the 3 month extension.
  Repeat request during meeting of 4/08/2025
  Received info only on 12/08/2025
  Almost 2 month later?!

- Request tagged data of two martial eagles from ERM on 11/03/2025 at 10h59
  Repeat request for tagged data from ERM on 29/03/2025 at 11h44
  Received refusal of data in email from applicant, mr Johans van Wyk, on 14/4/2025 at 20h40. ERM was also CC.
  Remind ERM, Mr Barbeau, on 15/04/2025 at 22h11 that formal answer on request for tagged data is still outstanding.
  Still no response from ERM !!

Is that what you and ERM means by **CREDIBLE, TRANSPARENT and ACCOUNTABLE?**

5 - 8 : Tagged data

Mulilo and EWT is in a partnership, confirmed in email from mr Johans van Wyk, in tagging the birds and therefore co-accountable for each other's conduct
The issue is not who did wrong but is the tagging done with a valid permit.?
If not, then it is illegal and that also implies for the data obtained by the unlawful act.
What ERM says by implication is that they are comfortable in driving a stolen vehicle as long as it is to their advantage?

Very dangerous and controversial approach..
We still insist that everything connected to the tagged data must be removed from the avifaunal report because it is illegally obtained regardless who did it.

The avifaunal specialist used the Verkykerkop tagged data in his report and on that ground we requested the permit to tagg that eagle (Bred)

9 - 11 : Specialist report and NDA

Mr Moodie strongly opposed the powerline crossing his farms and that also without consulting him.That was the main reason why Mr Moodie attended the meeting. Maybe you did not pick it up because Mr Moodie spoke Afrikaans.

Will address the rest in my comments.

Regards

Josua Meyer

> **1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?**
>
> MULILO: The applicant regrets that the *ad hoc* meeting request sent by you to the applicant in February this year was not attended to immediately. Unfortunately, the request for a private meeting with the applicant was not seen at the time by the applicant's representatives, and the applicant sincerely apologises for any frustration this may have caused you. The applicant and EAP remain committed to engaging with I&APs, and the in-person meeting requested by yourself, and attended by me as the appointed EAP for this project, and by the applicant's representatives, on the 4th of August 2025 was welcomed and seen to constitute substantive progress in responding to your queries. Your queries, and these responses, will obviously form part of the Comments and Responses Report included together with the next draft of the EIA Report.
>
> ERM: As the EAP, we are committed to engaging meaningfully with Interested and Affected Parties (I&APs) in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations under NEMA. We have undertaken all necessary steps and where possible, gone beyond these requirements to engage with the community. This has included an additional focus group meeting with you at a mutually suitable time within the regulated timelines to address your concerns. All I&AP comments have been acknowledged, and this engagement process remains ongoing.
>
> **2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?**
>
> ERM take the principles of credibility, transparency, and accountability in the EIA process very seriously. In this case, we regret that your initial request for a private meeting with the applicant, sent to the applicant in February, was not seen at the time by the applicant. Had it been, ERM would have engaged with you much earlier. Please include the EAP in such requests in order to ensure this is not missed in the future. The recent outreach was made in good faith. Once ERM became aware of your request for a meeting, ERM responded promptly in an effort to engage meaningfully and ensure your views are heard.

While ERM acknowledges that earlier engagement would have been preferable, we remain fully open to meeting and engaging in a meaningful and constructive way as the EIA process continues. ERM sees this as part of our commitment to upholding the intent and spirit of public participation, as set out in the Constitution and in NEMA and the 2014 NEMA EIA Regulations.

We believe that the EIA process we are facilitating has been credible, transparent, and accountable, in line with the requirements of NEMA. While the timing of certain engagements is sometimes influenced by the availability of multiple parties, we made every effort to accommodate your request for a meeting within the regulated timeframe. The process remains open, transparent, and documented for review by the competent authority.

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

During the scoping phase, it was noted that a biodiversity offset may be required based on final layouts proposed. However, this indication was based on preliminary findings and initial specialist inputs, which were still being refined at the time. As is typical in EIA processes, more detailed and site-specific assessments only become available during the impact assessment phase, once the full suite of specialist studies is completed and verified. It is on the basis of these completed studies that a more accurate determination of residual impacts, and thus the need for and scale of a biodiversity offset, can be made.

We understand the importance of early clarity, but it's also essential that such recommendations are based on robust, defensible data. That said, ERM has aimed to finalise and address these issues as efficiently and transparently as possible once the necessary information became available.

Biodiversity-related issues have been considered from the outset of the EIA process, beginning in the scoping phase. The assessment has been iterative, with the project layout being amended several times to address environmental sensitivities and viability concerns, including biodiversity matters. These changes are documented in the Comments and Responses Report (CRR) and specialist assessments.

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

Please see the attached correspondence as requested.

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

The appointed avifaunal specialist is an expert in the field of wind energy facility impacts on birds. Based on their expertise and experience, we have no reason to doubt the accuracy, credibility, and applicability of the data and modelling undertaken for this assessment.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

As illuded to in our response to Point 5 above. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report.

This permitting process is separate from the EIA, and as the EAP we do not have direct oversight over it.

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

The legality of the data collection process is the responsibility of the avifaunal specialist and the applicant. It is our understanding that a permit for such activities is legally required, and that the data included in the specialist report was provided on the basis that the necessary permit was obtained.

The data collected from the tagged Martial Eagle is invaluable. It provides critical insight into the bird's movements and habitat use, which directly strengthens the EIA findings; informs a more effective mitigation strategy; and ultimately, enhances the likely further and better protection of the species. As explained in Point 5 above – the EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The applicant was informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

The proposed Verkykerskop Wind Farm cluster is not a part of the proposed Emvelo and Sheepmoor wind farms and are consequently not relevant or applicable to the current process. The EAP supports the use of scientifically robust data and modelling, as this forms the foundation for effective and objectively defensible mitigation strategies. The EAP and applicant were informed by the EWT at the time that the Martial Eagles were trapped with the necessary permit in terms of the relevant provisions of the Mpumalanga Nature Conservation Act, 10 of 1998 (to catch birds for scientific purposes) was in place for the capture of the Martial Eagles. If the Martial Eagles were trapped without the necessary permit in place, then that might have implications for the person who undertook the capture in respect of possible sanction under the provincial conservation legislation referred to directly above. It does not however have the automatic consequence that the tracking data is unusable or otherwise unsuitable for purposes of the avifaunal expert's research, and ultimately, for inclusion in the draft EIA Report. As EAP, I am confident that the data and modelling undertaken to date to address avifaunal impacts (with particular reference to the Martial Eagle in response to your question) is both accurate and credible.

As a general practice, fieldwork permits obtained by specialists are not typically presented during stakeholder engagement or I&AP meetings.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

In the specialist reports, including the Social Impact Assessment, have been carefully considered and addressed to the extent possible within the on-going EIA process, and that will continue to be the case.

Where certain recommendations require further action, these have been clearly outlined for implementation during the construction and operational phases, and will be monitored through the Environmental Management Programme (EMPr).

We have reviewed the social specialist's findings and recommendations and accept them as valid and credible, given the specialist's expertise in the field. Recommendations and mitigation measures that could reasonably be incorporated into the Environmental Management Programme (EMPr) have been included. If there are specific recommendations you believe have not been adequately addressed, please let us know so that we can review them.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

Thank you for raising this important point.

While the EIA process does not require landowner consent for linear infrastructure at this stage, the applicant is committed to engaging in good faith negotiations with affected landowners to secure the necessary servitudes following the achievement of the EA. The landowner in question (Mr Moodie) did not formally raise any objections. He advised that the routing could be relooked at in due course. In recognition of the risks involved, and in the context of the NEMA EIA Regulations' requirement to consider reasonable and feasible alternatives, alternative powerline routes have also been assessed as part of the EIA to reduce potential impacts and improve the likelihood of an acceptable alignment being secured. The other landowners did not formally raise any objections yet and formal discussions still need to take place with these landowners to the extent that the OHL needs to traverse their respective properties.

The routing referred to in your comment is an alternative powerline route considered, and is not the preferred route. Our role as the EAP is to independently assess the potential impacts of alternatives, identify mitigation measures to reduce impacts to acceptable levels, and provide an informed opinion on the acceptability of the project. The final decision on whether the project may proceed rests with the DFFE.

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

The avifaunal exclusion zones are proposed by the appointed avifaunal specialist alone, informed by additional avifaunal studies commissioned by the applicant. The applicant has no role to play in determining the shape or size of proposed buffers. Please also see my response to your fifth question, above. It is common practice for parties to sign NDAs in order to protect confidential information, such as for instance intellectual property, specific project sites and does do not detract from or limits a specialist to act independently and impartially.

We operate on the assumption that all appointed specialists, including the avifaunal specialist, conduct their work in an ethical, independent manner, in compliance with the EIA Regulations. Both we as the EAP and all specialists have signed declarations of independence, as required under NEMA, confirming that our assessments are conducted impartially.

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Kind regards,

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

>
> Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.
>
> **Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were**

tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Hi Lucien, here are the reports with the revised layouts replaced where applicable (the last few maps in the reports).

There is an overlap with the Emvelo/Sheepmoor boundary that was provided where a central area fall within both sites. I have not had time to figure out what's going on there or to scrutinise the layout to check if there are any changes that affect the outcome of the assessment.

Dear Specialist,

I trust you are well.

Please find attached the final layout for the proposed Amsterdam WEF as received from the applicant. Kindly update your respective specialist reports to reflect this final layout, and to submit your revised reports by Monday, 12 August 2025.

If, for any reason, you anticipate that you will not be able to meet this deadline, please inform me as soon as possible so that we can explore alternative arrangements.

Thank you for your continued support and contributions to the project. Should you have any questions or require any additional information, please don't hesitate to reach out.

Kind regards,

ERM
Sustainability is our business

Dear Madam,

REVISED DRAFT ENVIRONMENTAL IMPACT ASSESSMENT REPORT: ACTIVITIES ASSOCIATED WITH THE EMVELO WIND ENERGY FACILITY ON PORTIONS 1, 2, 5 & RE OF THE FARM SCHIMMELHOEK 272 IT, AND PORTIONS 1, 2, 5, 6 & RE OF THE FARM SCHIEDAM 274 IT; THE ASSOCIATED GRID CONNECTION ON PORTIONS 1, 2, 5, 6 & RE OF THE FARM SCHIEDAM 274 IT, PORTIONS 2, 3, 4, 6, 9, 11, 12 & 13 OF THE FARM WAAIHOEK 286 IT, PORTION 7 OF THE FARM WITPUNT 267 IT, REMAINDER OF THE FARM ONVERWACHT 273 IT, PORTIONS 1 & 6 OF THE FARM ZWARTWATER 288 IT, PORTIONS 3, 4, 5, RE 6, 9, 10 & 11 OF THE FARM WELTEVREDEN 289 IT, THE REMAINDER, RE 1, RE 9, RE 11, RE 14 AND PORTIONS 7 & 8 OF THE FARM MOOIPLAATS 290 IT, PORTION 8 OF THE FARM BOSJESSPRUIT 291 IT, AND PORTIONS 1 & 2 OF THE FARM WELGELEGEN 322 IT; AND ASSOCIATED ACCESS ROADS ON PORTIONS 6, 7, 12, 23 & 26 OF THE FARM ROODEWAL 272 IT AND PORTIONS 1, 2, 3, 4 & 26 OF THE FARM ONVERWACHT 273 IT, MSUKALIGWA LOCAL MUNICIPALITY

The revised draft environmental impact assessment report which was submitted by you in respect of the abovementioned application and received by the Department on 16 July 2025 has reference. The Department has considered the content of the report, and has the following comments:

1. The layout provided in the initial draft EIAR included 24 turbines. It was not explicit in the revised draft EIR, which now includes 22 turbines, but after scrutinizing the layout plan and the responses provided in the comments and response report (CRR), we have been able to ascertain the following changes: The removal of WTG 24; the movement of WTG 21 out of Emvelo and into the Sheepmoor site; and slight changes to the localities of WTGs 3, 7, 12, 13, 14, 19, 20, 22, 23 and 25. None of the turbines that were moved or micro-sited have been moved into less sensitive areas. Sixteen (16) of the 22 turbines proposed in the current layout, all of which were flagged in our previous comments, are still located in sensitive areas. Given that the requirement to avoid impacts in accordance with the mitigation hierarchy has not been adequately addressed, **these comments must be read in conjunction with our comments dated 10 April 2025, which still stand.**
2. The proposed Emvelo Wind Energy Facility and associated grid infrastructure is located on a site comprising: CBA Irreplaceable and Optimal; Intact Grassland Patches; Key Biodiversity Areas; the Grasslands Important Bird Area (IBA); Ecological Support Areas; National Protected Area Expansion Strategy Areas (NPAES); Threatened Ecosystems – including Wakkerstroom Montane Grassland and Eastern Highveld Grassland; CBA: Aquatic Rivers; ESA: Strategic Water Source Area; ESA: Wetlands and ESA: Important Subcatchments.

3. Furthermore, the proposed Emvelo WEF and associated grid connection is located in an area comprising a high fauna sensitivity, a high diversity of threatened bird species, and a high number of priority species for wind energy developments and power lines, including the following confirmed on site: African Grass Owl, African Marsh Harrier, Blue Crane, Cape Vulture, Denham's Bustard, Greater Flamingo, Grey Crowned Crane, Lanner Falcon, Martial Eagle, Secretarybird, Southern Bald Ibis, Sensitive Species 23, White-bellied Bustard, and Yellow-breasted Pipit.
4. According to the Avifaunal Assessment, a total of 253 bird species could potentially occur in the Broader Area where the Emvelo WEF and associated Grid Connection Infrastructure are proposed to be located. Of the 253 species, 38 species are classified as priority species for wind energy developments, of which 32 were recorded during pre-construction monitoring. Of the 253 species, 76 are considered power line sensitive species, 57 of which were recorded during the pre-construction monitoring.
5. DARDLEA is not supportive of development of WEFs (or any non-compatible land use) within Critical Biodiversity Areas and Key Biodiversity Areas, or within intact grassland patches. In respect of Intact Grassland Patches, it is important to note that the Mpumalanga Biodiversity Sector Plan (MBSP) specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened fauna and avifauna. This is verified in the faunal assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area". Intact Grassland Patches are important source areas in terms of metapopulation dynamics. The MBSP - adopted in 2023 (Provincial Notice 279 of 2023) - is a planning tool that has been developed to manage biodiversity resources of the province by setting strategic objectives to ensure that spatial biodiversity and climate change priorities are effectively incorporated into land-use and development planning, environmental assessments and authorisations, and natural resource management within Mpumalanga Province. The links to the various reports and shape files, including the MBSP Technical Report which details the scientific methods used to identify Intact Grassland Patches, can be accessed at https://mtpa.maps.arcgis.com/sharing/rest/content/items/fc6d8f9e7ef84d2f87f86b91e8e9f87a/data).
6. While we acknowledge efforts to acquire GPS tracking data for Martial Eagle, the modelling of the data and the datasets must be subjected to additional independent peer-reviewed analyses in order to verify accuracy and confidence levels. In the absence of this, the precautionary approach, which is the application of sector-accepted buffers, must be applied.
7. While we acknowledge the methodology applied to inform the Avifaunal Specialist's Sensitivity Zones (Very High, High and Medium) for Martial Eagle and Southern Bald Ibis, confidence in the methodology also requires testing through a broad, formal peer-reviewed analysis within the avifaunal sector, which is beyond the scope of an EIA. Until this is achieved, a precautionary approach is warranted, as follows:
    7.1. In accordance with BirdLife SA's Bird Monitoring Reports from Operational Wind Energy Facilities in South Africa (2025), a nest buffer of 6km is recommended for Martial Eagles (which report also states that that the available data suggests that this buffer will not eliminate the risk of collisions, and that it would be necessary to implement additional mitigation measures outside of this area).
    7.2. A minimum buffer of 1km from Southern Bald Ibis colonies.
8. Similarly, turbines and all associated infrastructure, including access roads as well as the upgrading of existing roads (which are currently seldom-used jeep tracks), must avoid Yellow-breasted Pipit habitat entirely, i.e. both "Very High" and "High" sensitivity zones. It is also concerning to note that in the initial draft EIA, the Avifaunal Specialist had designated the modelled Yellow-breasted Pipit habitat entirely as "Very High Sensitivity – No-go Zone", but has in the revised report, incorporated a new "High Risk – Turbine exclusion zone" into the initial no-go zone, for, what it appears, the purpose of accommodating Collector networks and road networks. The Avifaunal Specialist does recommend moving Turbine 23 as it is located in the

turbine exclusion zone, but as indicated above, infrastructure – including roads and collector networks within Yellow-breasted Pipit habitat is not supported.

9. Given the limited data available on Species 23 movements and collision risks, the curtailment strategy for turbines proposed in the "Medium Sensitivity" Zone for the species is not supported. Mitigation strategies that have no data to validate their success cannot be used to replace the requirement for avoidance. All Turbines and all associated infrastructure must avoid Species 23 habitat entirely, i.e. in "Very High", "Medium" and "High" sensitivity zones.
10. The Avifaunal Report confirms the presence of Species 23, but the location is not disclosed. The Avifaunal Assessment must confirm how the recommended sensitivity zones for Species 23 align with BirdLife SA's "Guidelines for surveying and mitigating impacts on [Species 23] in avifaunal assessments for development applications", particularly in respect of the following excerpt of the guideline that specifies a 5km buffer to be applied to suitable wetlands:

    "*Birds function at a wider ecological scale than most upper-catchment wetlands, thus requiring a larger and interconnected species buffer zone to ensure adequate impact mitigation from developments. Literature from studies on waterbirds, particularly rallids, provides several recommendations for designing and implementing buffer zones. As a general guideline for developments with collision risks, like wind turbines,* ***buffer zones of at least 5 km between the development and wetlands suitable for the [Species 23] are recommended, with buffer zones of at least 1 km for delineated wetland inputs*** *(e.g., streams and aquifers), aquatic-habitat corridors (e.g., riverine habitat), and potential movement pathways between wetlands".*

11. The number of turbines that are located in areas recommended for avoidance (at least 16 out of 22), and the location of the roads, construction camps and OHLs in sensitive areas demonstrates that the site is not compatible with the proposed land use. The areas of concern as they relate to the abovementioned comments, are outlined below:
    11.1. WTG 3 – KBA; NPAES; Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.2. WTG 4 – Within 5km Martial Eagle Buffer.
    11.3. WTG 5 – Edge of High Risk Turbine Exclusion Zone for Sp23 (Highlighted in Revised Avifaunal Assessment to be moved); Within 5km Martial Eagle Buffer; Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.4. WTG 7 - Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.5. WTG 10 – Within 5km Martial Eagle Buffer.
    11.6. WTG 11 – Within 5km Martial Eagle Buffer; Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.7. WTG 12 – Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved); KBA.
    11.8. WTG 13 – Intact Grassland, Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved); Edge of High Risk Turbine Exclusion Zone for Sp23 (Highlighted in Revised Avifaunal Assessment to be moved); Faunal High Sensitivity - escarpment (highest category); IBA; NPAES.
    11.9. WTG 14 – CBA Optimal (no evidence of "invasion"); Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved); Edge of Intact Grassland; Fauna High Sensitivity; NPAES; IBA.
    11.10. WTG 15 - Partially within an untransformed CBA Irreplaceable, Edge of High Risk Turbine Exclusion Zone for Sp23 (Highlighted in Revised Avifaunal Assessment to be moved); Within 5km Martial Eagle Buffer; NPAES; KBA; Terrestrial Biodiversity High (Edge of Highveld Grassland).
    11.11. WTG 17 – KBA; IBA; NPAES.
    11.12. WTG 19 – Intact Grassland; IBA; NPAES; Faunal High Sensitivity - escarpment (highest category); Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved); Medium Risk Zone for Sp23.
    11.13. WTG 20 - Intact Grassland; Within 5km Martial Eagle Buffer; Avifaunal High Risk Turbine Exclusion Zone (Highlighted in Revised Avifaunal Assessment to be moved);

Medium Risk Zone for Sp23; Faunal High Sensitivity - escarpment (highest category); NPAES.

11.14. WTG 22 – Intact Grassland; Faunal High Sensitivity - escarpment (highest category); NPAES; IBA; within 5km Martial Eagle Buffer.

11.15. WTG 23 – Intact Grassland; Within 5km Martial Eagle Buffer; Yellow-breasted Pipit habitat (Highlighted in Revised Avifaunal Assessment to be moved); Medium Risk Zone for Sp23; Faunal High Sensitivity - escarpment (highest category); IBA; NPAES.

11.16. WTG 25 – Intact Grassland; Faunal High Sensitivity - escarpment (highest category); Within 5km Martial Eagle Buffer; Rotor-swept area penetrates High Risk Turbine Exclusion Zone for Southern Bald Ibis (Highlighted in Revised Avifaunal Assessment to be moved); Medium Risk Zone for Sp23; NPAES; IBA.

12. The following infrastructure is located in sensitive areas:
    12.1. The entire Grid in the southern Emvelo site: Intact Grassland; Faunal High Sensitivity - escarpment (highest category); High Avifauna Sensitivity (Due to, inter alia, the large amount of wetlands/drainage lines and natural grasslands).
    12.2. Portions of the OHL and access roads in southern Emvelo site: Intact Grasslands, which is confirmed High Sensitivity for Fauna, but note that intact grassland also crucial for avifauna).
    12.3. Collector network and Roads in Southern portion of Emvelo are in Yellow-breasted Pipit habitat (noting that upgrading seldom used jeep tracks will still have substantive impacts for the species).
    12.4. The construction camp is located adjacent to WTG15, which is in the Avifaunal Medium Risk Zone for Sp23 (which was recommended for removal by the Avifaunal Specialist).
13. Turbines locations in terms of Bat Sensitivity could not be confirmed. The Figures in the Bat Specialist Report dated February 2025 were once again not provided. We have not been able to determine whether any turbines in the current layout – following the re-positioning of turbines since the bat assessment was undertaken - are located in No-Go areas for Bats.
14. The Terrestrial Assessment (inclusive of Plant Species), did not apply the Site Ecological Importance (SEI) methodology, which is a requirement of the Species Environmental Assessment Guideline. The Species Protocols specifically stipulate that assessments "must be undertaken in accordance with the *Species Environmental Assessment Guideline"* (South African National Biodiversity Institute, 2020. Species Environmental Assessment Guideline. Guidelines for the implementation of the Terrestrial Fauna and Terrestrial Flora Species Protocols for environmental impact assessments in South Africa. South African National Biodiversity Institute, Pretoria). Non-compliance with the *Species Environmental Assessment Guideline* has resulted in the following deficiencies:
    14.1. Insufficient time was allocated to surveying in the appropriate season (only 4 days for both Sheepmoor and Emvelo WEF sites, as well as the Grid sites).
    14.2. The classification of the Montane Grassland on site as "moderate sensitivity" in the absence of applying all relevant criteria, including *inter alia*, conservation importance, functional integrity, receptor resilience, as well as species of conservation concern, spatial priorities, intact grassland patches, and CBAs.
    14.1. The montane ridge (where WTGs 13, 19, 20, 22, 23 and 25, along with grid infrastructure are proposed), which also coincides with intact grassland and the highest sensitivity for Fauna (according to the Faunal Assessment), being classified as "moderate sensitivity". (Noting further that according to the Fauna Assessment, "the high sensitive escarpment area is likely of general importance for a range of faunal groups, <u>representative of a large contiguous and ecologically intact area</u> <u>of mostly good-quality montane grassland</u>". If the correct and required criteria are applied, the classification of this area is more likely to be classified as "High" or "Very High Sensitivity".
15. As a result of the deficiencies in the Terrestrial Assessment outlined above, we have low confidence in the associated impact analysis, and dispute the Specialist's "low" significance ratings.
16. The Impact Analyses in respect of Avifauna and Fauna are also disputed.
    16.1. The Avifaunal Assessment recommended that 9 turbines in high risk zones be relocated, but this has not been implemented in the layout presented as the preferred alternative.

This is misleading; the impact analysis must be based on the layout presented, which would translate to High Significance ratings for all impacts assessed with respect to Avifauna.

16.2. The Fauna Assessment recommendations included moving turbines out of High Sensitivity Areas for Fauna. The Impact Analysis was therefore not undertaken on the layout that was presented, and is accordingly disputed. The significance ratings for impacts assessed with respect to fauna should remain High.

17. While an Oribi Management Plan has been undertaken and included in this revised draft EIA (not in the initial draft EIA), it cannot be motivation to mitigate the potential impact on the species. The Oribi Management Plan clearly states that an "Oribi baseline assessment will be required to understand the current status of the subpopulation, including distribution and population estimates". The report further states that the "WEF layout needs to minimise number of turbines and infrastructure (including laydown)".
18. Biodiversity Offset Strategy:
    18.1. According to the Biodiversity Offset Guideline, "*The desired outcome of biodiversity offsets is to ensure that - the cumulative impact of an authorised activity, or activities, and land and resource use change does not: result in the loss of irreplaceable biodiversity or jeopardise the ability to meet biodiversity targets; lead to any ecosystem with a threat status of Vulnerable or Least Concern becoming Endangered; or any Endangered ecosystem becoming Critically Endangered; or cause an irreversible decline in the conservation status of species and the presence of special habitats; or cause a significant loss in ecosystem services*". A biodiversity offset cannot therefore cater for the loss of Irreplaceable CBAs or intact grasslands. As detailed in the comments above, intact grasslands are crucial for supporting threatened fauna and avifauna.
    18.2. The Biodiversity Offset Guideline specifically states that "biodiversity offsets are not appropriate when an activity, or activities, will have residual impacts on biodiversity of very high significance, including when residual negative impacts will result in loss of irreplaceable biodiversity".
    18.3. In addition to Irreplaceable CBAs, the Biodiversity Offset Guideline also categorises the following as "irreplaceable biodiversity": Biodiversity of major potential concern, where residual impacts in this category could lead to – loss of vulnerable or potentially irreplaceable biodiversity in areas of recognised importance, such as – areas evaluated as having High Ecological Site Importance. We maintain that the correct and required implementation of the Species Environmental Assessment Guideline would have resulted in the Montane Grassland being classified as having High Ecological Site Importance.
    18.4. The Intact Grassland Patches on the site must therefore be avoided, and cannot be offset. The requirement to consider biodiversity offsets is applicable only once it has been demonstrated that all measures of avoidance have been exhausted. The loss of irreplaceable biodiversity cannot be offset, and, as outlined above, "irreplaceable biodiversity" includes, key ecological corridors recognized as important for evolutionary processes and climate change adaptation where no options to safeguard these processes exist.
    18.5. Furthermore, the Biodiversity Offset Report does not meet the following minimum requirements:
        i. A portfolio of candidate biodiversity offset sites, including the likelihood of each site's availability and feasibility.
        ii. The required biodiversity outcomes on each of the candidate biodiversity offset sites.
19. Cumulative Impact Assessment:
    19.1. In our comments dated 10 April 2025 on your original draft EIA, despite bringing another 5 approved and in-process WEFs (within a 35 km radius) to your attention (i.e. Zephyr, Ujekamanzi Ntabande and Daggafoort and Emvelo), your revised cumulative impact assessment once again fails to mention or assess these. Subsequently, there are now an additional 3 WEFs within 35 km that are now in-process, i.e. Leghoya WEF 1, 2 & 3, and another one (1) within a 55 km radius (i.e. Anemoi WEF).

19.2. Furthermore, although section 4.3.3 states that "the scope of this assessment will include all operational, approved or current and planned renewable energy applications", in addition to the approved or in-process WEFs identified in 17.1. above (not included in this assessment), there are actually an additional two (2) WEFs within 35 km and a further two (2) proposed WEFs (i.e. Pre-Application) within a 55 km radius, that have not been identified. The total number of turbines within 35 km is more than double that indicated in both the Draft EIA and Revised Draft EIA reports, i.e. 435 (and not 192) and within a 55 km radius there are more than 663 turbines (approved, in-process and proposed). As a minimum, the cumulative impact of approved and in-process applications must be assessed.

19.3. The potential cumulative impact on avifauna, as indicated in our comments dated 10 April 2025, is now therefore likely to be even more substantial, due to the increased number of proposed turbines in the surrounding landscape. Of particular concern is the potential cumulative impact on Martial Eagles and Cape Vultures. The BirdLife South Africa Occasional Report Series 3: Summary of Bird Monitoring Reports from Operational Wind Energy Facilities in South Africa (February 2025), indicates that at current fatality rates due to collisions with wind turbines, "fatalities of Martial Eagles may already be exceeding the Potential Biological Removal (PBR) rate". Furthermore, "if current fatality rates at operational wind farms continue, at least 37 Cape Vultures could be lost to turbine collisions annually, representing a significant portion of the PBR. This figure is most probably an underestimate" (see limitations in the report) "and does not account for the anticipated acceleration of wind energy development. Unless other human-induced threats, such as powerline electrocutions and collisions, and poisoning, are urgently addressed, the population may not be able to withstand the added impact of turbine collisions."

19.4. Further to our comments dated 10 April 2025 and considering the additional WEFs in the surrounding landscape, we are now even more concerned about the cumulative impacts of these facilities on Oribi habitat, as expressed in the faunal assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area".

19.5. DFFE also requires that "the cumulative impact assessment for all identified and assessed impacts must indicate the following: (a) Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e. hectares of cumulatively transformed land". The Revised EIA Report does again not accurately quantify the size of the identified impacts, i.e. hectares of cumulatively transformed land. The overall footprint size of this, and all other similar proposed and approved renewable energy facilities within a 35 km radius is now 178 017.24 ha (Approved: 31 440.17 ha, In Progress: 89 247.96 ha, Pre-Application: 57 329.11 ha). Again, as a minimum, the cumulative impact of approved and in-process applications must be assessed.

19.6. As there has been no amendment in the revised EIA Report to the number of facilities identified surrounding this proposed facility, or a comprehensive comparative cumulative assessment undertaken, our previous comments on this matter dated 10 April 2025 remain unchanged, i.e. the cumulative impact assessment undertaken as part of this EIA does not adequately assess the cumulative impacts of this proposed facility, in relation to current and future similar renewable development facilities in the surrounding area.

20. Environmental Management Programme:

20.1. Our concerns related to the EMPr raised previously, still remain. The EMPr is unclear and vague, ambiguous, and does not provide adequate mitigation measures, timeframes, roles, responsibilities and reporting to adequately mitigate the potential impacts of this facility.

20.2. Given that we do not agree with the impact analyses undertaken in the EIA, the measures included in the EMPr as mitigation are, similarly, disputed.

20.3. The EMPr does not include a specific, measurable and timebound framework for decision-making regarding the duration of monitoring, and the specific circumstances for extension or curtailment.
20.4. The EMPr must be clear on when additional research is required.
20.5. Landowners must understand all access requirements and impacts associated with monitoring *throughout the lifespan of a project*.
20.6. Lease agreements must ensure that the effectiveness of monitoring is not compromised, and that restrictions do not compromise monitoring requirements in any way.

21. Public Participation:
21.1. In paragraph 9.3.2 (page 280) of the EIA Report, it is stated that "A comprehensive record of all comments received to date along with detailed responses from the Environmental Assessment Practitioner (EAP), specialists, and the project applicant is presented in the Comments and Responses Report (Volume II). For transparency and ease of reference, the original comments and corresponding responses are also appended to this volume". Then in the Paragraph 6 of the Public Participation Report (Volume III), it states that "During the DEIAR PPP comments were received from I&AP's. Follow-up e-mails were sent to all registered I&APs, stakeholders and authorities, and comments were received. Responses to comments received during the PP period are provided in Section 7, Table 7.1 below, with EAP / specialist / applicant responses, and the original comment and responses has been appended to the PP report which will be submitted with the FSR for DFFE decision".
21.2. However, in the copies of Emails included in the Public Participation Report, comments were submitted to you on 4, 9 and 10 April 2025 by: Megan Kim Govender; Adelma Vorster (Retsrov Boerdery); Celine Oats (Richard Summers Inc.); and Elize Robberts. *These comments have not been incorporated in your Comments and Response Report, nor have copies of the comments been appended to the Public Participation Report.*

Based on what has been outlined above, at least more than half (i.e. 16) of the 22 turbines proposed are located in unsuitable areas. Furthermore, the application of no-go buffers in accordance with BirdLife SA's Guidelines for surveying and mitigating impacts on [Species 23] referred to herein would likely increase the number of turbines that are in unsuitable areas. In light of this, and in conjunction with the location of associated roads, OHLs and cabling in CBAs, intact grasslands, and avifauna and fauna high sensitivity areas, DARDLEA cannot support the application in its current format.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

Dear Madam,

DRAFT ENVIRONMENTAL IMPACT ASSESSMENT REPORT: ACTIVITIES ASSOCIATED WITH THE SHEEPMOOR WIND ENERGY FACILITY ON THE FARM KLIPFONTEIN 283 IT, PORTIONS 1, 2 & 6 OF THE FARM SCHIEDAM 274 IT, PORTIONS 2, 3, 5, 6, 7, 9, 10 & 13 OF THE FARM WAAIHOEK 286 IT, RE 1 & PORTION 5 OF THE FARM VAALBANK 285 IT, PORTION 3 OF THE FARM ONVERWACHT 287 IT, AND PORTIONS 1 & 8 OF THE FARM WINDHOEK 291 JT; THE ASSOCIATED GRID CONNECTION ON PORTIONS 2, 3, 4 & 12 OF THE FARM WAAIHOEK 286 IT, PORTION 8 OF THE FARM WINDHOEK 291 IT, RE OF THE FARM ONVERWACHT 287 IT, PORTIONS 3, 4, 5, 6, 9, 10 & 11 OF THE FARM WELTEVREDEN 290 IT, RE, RE 1, PORTIONS 7 & 8, RE 9, RE, 11, RE 14 OF THE FARM MOOIPLAATS 290 IT, PORTION 8 OF THE FARM BOSJESSPRUIT 291 IT, PORTION 2 OF THE FARM 292 IT, PORTIONS 1 & 2 OF THE FARM WELGELEGEN 322 IT, PORTION 6 OF THE FARM ZWARTWATER 288 IT, AND PORTION 7 OF THE FARM WITPUNT 267 IT; AND ASSOCIATED ACCESS ROADS ON PORTIONS 6, 7, 12, 23 & 26 OF THE FARM ROODEWAL 272 IT, AND PORTIONS 2, 3, 4 & 7 OF THE FARM ONVERWACHT 273 IT, MSUKALIGWA LOCAL MUNICIPALITY

The revised draft environmental impact assessment report (EIAR)which was submitted by you in respect of the abovementioned application and received by the Department on 16 July 2025 has reference. The Department has considered the content of the report, and has the following comments:

1. The layout provided in the initial draft EIAR included 29 turbines. It was not explicit in the revised draft EIR, which now includes 25 turbines, but after scrutinizing the layout plan and the responses provided in the comments and response report (CRR), we have been able to ascertain the following changes: The removal of WTGs 35, 39, 47 and 49, and the addition of WTG 21 (i.e. the removal of four turbines). A total of 10 turbines have been moved, but of these, only one has been moved into an area without sensitivities. Seventeen (17) of the 25 turbines proposed in the current layout, all of which were flagged in our previous comments, are still located in sensitive areas. Given that the requirement to avoid impacts in accordance with the mitigation hierarchy has not been adequately addressed, **these comments must be read in conjunction with our comments dated 10 April 2025, which still stand.**
2. DARDLEA remains concerned that the proposed location of the Sheepmoor WEF and associated grid infrastructure is not compatible with the desired land use.

3. The proposed Sheepmoor Wind Energy Facility and associated grid infrastructure is located on a site comprising: CBA Irreplaceable and Optimal; Intact Grassland Patches; Key Biodiversity Areas; the Grasslands Important Bird Area (IBA); Ecological Support Areas; National Protected Area Expansion Strategy Areas (NPAES); Local-scale and Landscape-scale Climate Change Corridors; Threatened Ecosystems – including Wakkerstroom Montane Grassland and Eastern Highveld Grassland; CBA: Wetlands; CBA: Aquatic Rivers; ESA: Strategic Water Source Area and ESA: Important Subcatchments.
4. Furthermore, the proposed Sheepmoor WEF and associated grid connection is located in an area comprising a high fauna sensitivity, a high diversity of threatened bird species, and a high number of priority species for wind energy developments and power lines, including the following confirmed on site: African Fish Eagle, African Grass Owl, African Harrier-Hawk, African Marsh Harrier, Amur Falcon, Black Sparrowhawk, Black-winged Kite, Black-winged Lapwing, Black-winged Pratincole, Blue Crane, Cape Vulture, Common Buzzard, Denham's Bustard, Greater Flamingo, Grey Crowned Crane, Grey-winged Francolin, Jackal Buzzard, Lanner Falcon, Long-crested Eagle, Marsh Owl, Martial Eagle, Rufous-breasted Sparrowhawk, Secretarybird, Southern Bald Ibis, Sensitive Species 23, Spotted Eagle-Owl, White Stork, White-bellied Bustard, and Yellow-breasted Pipit.
5. According to the Avifaunal Assessment, a total of 253 bird species could potentially occur in the Broader Area where the Sheepmoor WEF and associated Grid Connection Infrastructure are proposed to be located. Of the 253 species, 38 species are classified as priority species for wind energy developments, of which 32 were recorded during pre-construction monitoring. Of the 253 species, 76 are considered power line sensitive species, 57 of which were recorded during the pre-construction monitoring.
6. DARDLEA is not supportive of development of WEFs (or any non-compatible land use) within Critical Biodiversity Areas and Key Biodiversity Areas, or within intact grassland patches. In respect of Intact Grassland Patches, it is important to note that the Mpumalanga Biodiversity Sector Plan (MBSP) specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened fauna and avifauna. This is verified in the faunal assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area". Intact Grassland Patches are important source areas in terms of metapopulation dynamics. The MBSP - adopted in 2023 (Provincial Notice 279 of 2023) - is a planning tool that has been developed to manage biodiversity resources of the province by setting strategic objectives to ensure that spatial biodiversity and climate change priorities are effectively incorporated into land-use and development planning, environmental assessments and authorisations, and natural resource management within Mpumalanga Province. The links to the various reports and shape files, including the MBSP Technical Report which details the scientific methods used to identify Intact Grassland Patches, can be accessed at https://mtpa.maps.arcgis.com/sharing/rest/content/items/fc6d8f9e7ef84d2f87f86b91e8e9f87a/data).
7. While we acknowledge efforts to acquire GPS tracking data for the Martial Eagle, the modelling of the data and the datasets must be subjected to additional independent peer-reviewed analyses in order to verify accuracy and confidence levels. In the absence of this, the precautionary approach, which is the application of sector-accepted buffers, must be applied.
8. While we acknowledge the methodology applied to inform the Avifaunal Specialist's Sensitivity Zones (Very High, High and Medium) for Martial Eagle and Southern Bald Ibis, confidence in the methodology also requires testing through a broad, formal peer-reviewed analysis within the avifaunal sector, which is beyond the scope of an EIA. Until this is achieved, a precautionary approach is warranted, as follows:
    8.1. In accordance with BirdLife SA's Bird Monitoring Reports from Operational Wind Energy Facilities in South Africa (2025), a nest buffer of 6km is recommended for Martial Eagles

(which report also states that that the available data suggests that this buffer will not eliminate the risk of collisions, and that it would be necessary to implement additional mitigation measures outside of this area).

8.2. A minimum buffer of 1km from Southern Bald Ibis colonies.

9. Similarly, turbines and all associated infrastructure, including access roads as well as the upgrading of existing roads (which are currently seldom-used jeep tracks), must avoid Yellow-breasted Pipit habitat entirely, i.e. both "Very High" and "High" sensitivity zones.
10. Given the limited data available on Species 23 movements and collision risks, the curtailment strategy for turbines proposed in the "Medium Sensitivity" Zone for the species is not supported. Mitigation strategies that have no data to validate their success cannot be used to replace the requirement for avoidance. All Turbines and all associated infrastructure must avoid Species 23 habitat entirely, i.e. "Medium", "High" and "Very High" sensitivity zones.
11. The Avifaunal Report confirms the presence of Species 23, but the location is not disclosed. The Avifaunal Assessment must confirm how the recommended sensitivity zones for Species 23 align with BirdLife SA's "Guidelines for surveying and mitigating impacts on [Species 23] in avifaunal assessments for development applications", particularly in respect of the following excerpt of the guideline that specifies a 5km buffer to be applied to suitable wetlands:

    "*Birds function at a wider ecological scale than most upper-catchment wetlands, thus requiring a larger and interconnected species buffer zone to ensure adequate impact mitigation from developments. Literature from studies on waterbirds, particularly rallids, provides several recommendations for designing and implementing buffer zones. As a general guideline for developments with collision risks, like wind turbines,* ***buffer zones of at least 5 km between the development and wetlands suitable for the [Species 23] are recommended, with buffer zones of at least 1 km for delineated wetland inputs*** *(e.g., streams and aquifers), aquatic-habitat corridors (e.g., riverine habitat), and potential movement pathways between wetlands".*

12. The number of turbines that are located in areas recommended for avoidance (at least 17 out of 25), and the location of the O&M building, roads and OHLs in sensitive areas demonstrates that the site is not compatible with the proposed land use. The areas of concern as they relate to the abovementioned comments, are outlined below:
    12.1. WTG 26: Intact grassland; IBA; NPAES; Fauna High Sensitivity - escarpment (highest category); Within 5km Martial Eagle buffer; Less than 1km from Southern Bald Ibis colony; Species 23 Avifaunal Medium Zone.
    12.2. WTG 27: Intact grassland; IBA; NPAES; Fauna High Sensitivity - escarpment (highest category); Within 1km of Southern Bald Ibis colony; Species 23 Avifaunal Medium Zone.
    12.3. WTG 28: Intact grassland; IBA; NPAES; Fauna High Sensitivity - escarpment (highest category); Within 1km of Southern Bald Ibis colony; Species 23 Avifaunal Medium Zone.
    12.4. WTG 29: Intact grassland; IBA; NPAES; Fauna High Sensitivity - escarpment (highest category); Within 1km of Southern Bald Ibis colony; Species 23 Avifaunal Medium Zone.
    12.5. WTG 30: Intact grassland; Partial IBA; NPAES; Fauna High Sensitivity - escarpment (highest category).
    12.6. WTG 31: Intact grassland; NPAES; Species 23 Avifaunal Medium Zone.
    12.7. WTG 33: Intact grassland partial; NPAES.
    12.8. WTG 36: CBA Irreplaceable; NPAES.
    12.9. WTG 38: High/Very High Terrestrial Sensitivity.
    12.10. WTG 41: Within 650m of Southern Bald Ibis Colony.
    12.11. WTG 42: Within 1km of Southern Bald Ibis Colony.
    12.12. WTG 43: Climate change corridor; Intact grassland; ESA; NPAES.
    12.13. WTG 44: Climate change corridor; ESA; NPAES; Species 23 Avifaunal Medium Zone.
    12.14. WTG 46: High/Very High Terrestrial Sensitivity.
    12.15. WTG 45: CBA Irreplaceable; NPAES, Climate change corridor; Species 23 Avifaunal Medium Zone.
    12.16. WTG 52: Climate change corridor; Intact grassland; ESA; IBA; NPAES.

12.17. WTG 53: Climate change corridor; Intact grassland; ESA; IBA; NPAES; High/Very High Terrestrial Sensitivity.
12.18. The O&M Building is located in Bat No-Go area.
12.19. The road network, collector network, and transmission lines traverse the Avifaunal All Infrastructure Exclusion Zone, the High Fauna Sensitivity Zone, Intact Grasslands, CBAs and ESAs.

13. It is noted that the Noise Specialist recommended the relocation of WTGs 29 and 30, and the reduction of the number of turbines within 800m of receptors.
14. The Terrestrial Assessment (inclusive of Plant Species), did not apply the Site Ecological Importance (SEI) methodology, which is a requirement of the Species Environmental Assessment Guideline. The Species Protocols specifically stipulate that assessments "must be undertaken in accordance with the *Species Environmental Assessment Guideline"* (South African National Biodiversity Institute, 2020. Species Environmental Assessment Guideline. Guidelines for the implementation of the Terrestrial Fauna and Terrestrial Flora Species Protocols for environmental impact assessments in South Africa. South African National Biodiversity Institute, Pretoria). Non-compliance with the *Species Environmental Assessment Guideline* has resulted in the following deficiencies:
    14.1. Insufficient time was allocated to surveying in the appropriate season (only 4 days for both Sheepmoor and Emvelo WEF sites, as well as the Grid sites).
    14.2. The classification of the Montane Grassland on site as "moderate sensitivity" in the absence of applying all relevant criteria, including *inter alia*, conservation importance, functional integrity, receptor resilience, as well as species of conservation concern, spatial priorities, intact grassland patches, and CBAs.
    14.1. The montane ridge (where WTGs 26, 27, 28, 29, 30 and 33, along with grid infrastructure are proposed), which also coincides with intact grassland and the highest sensitivity for Fauna (according to the Faunal Assessment), being classified as "moderate sensitivity". (Noting further that according to the Fauna Assessment, "the high sensitive escarpment area is likely of general importance for a range of faunal groups, <u>representative of a large contiguous and ecologically intact area</u> <u>of mostly good-quality montane grassland</u>".
15. As a result of the deficiencies in the Terrestrial Assessment outlined above, we have low confidence in the associated impact analysis, and dispute the Specialist's "low" significance ratings.
16. While an Oribi Management Plan has been undertaken and included in this revised draft EIA (not in the initial draft EIA), it cannot be motivation to mitigate the potential impact on the species. The Oribi Management Plan clearly states that an "Oribi baseline assessment will be required to understand the current status of the subpopulation, including distribution and population estimates". The report further states that the "WEF layout needs to minimise number of turbines and infrastructure (including laydown)".
17. Cumulative Impact Assessment:
    17.1. In our comments dated 10 April 2025 on your original draft EIA, despite bringing another 5 approved and in-process WEFs (within a 35 km radius) to your attention (i.e. Zephyr, Ujekamanzi Ntabande and Daggafoort and Emvelo), your revised cumulative impact assessment once again fails to mention or assess these. Subsequently, there are now an additional 3 WEFs within 35 km that are now in-process, i.e. Leghoya WEF 1, 2 & 3, and another one (1) within a 55 km radius (i.e. Anemoi WEF).
    17.2. Furthermore, although section 4.3.3 states that "the scope of this assessment will include all operational, approved or current <u>and planned</u> renewable energy applications", in addition to the approved or in-process WEFs identified in 17.1. above (not included in this assessment), there are actually an additional two (2) WEFs within 35 km and a further two (2) proposed WEFs (i.e. Pre-Application) within a 55 km radius, that have not been identified. The total number of turbines within 35 km is more than double that indicated in both the Draft EIA and Revised Draft EIA reports, i.e. 435 (and not 192) and within a 55 km radius there are more than 663 turbines (approved, in-process and

proposed). As a minimum, the cumulative impact of approved and in-process applications must be assessed.

17.3. The potential cumulative impact on avifauna, as indicated in our comments dated 10 April 2025, is now therefore likely to be even more substantial, due to the increased number of proposed turbines in the surrounding landscape. Of particular concern is the potential cumulative impact on Martial Eagles and Cape Vultures. The BirdLife South Africa Occasional Report Series 3: Summary of Bird Monitoring Reports from Operational Wind Energy Facilities in South Africa (February 2025), indicates that at current fatality rates due to collisions with wind turbines, "fatalities of Martial Eagles may already be exceeding the Potential Biological Removal (PBR) rate". Furthermore, "if current fatality rates at operational wind farms continue, at least 37 Cape Vultures could be lost to turbine collisions annually, representing a significant portion of the PBR. This figure is most probably an underestimate" (see limitations in the report) "and does not account for the anticipated acceleration of wind energy development. Unless other human-induced threats, such as powerline electrocutions and collisions, and poisoning, are urgently addressed, the population may not be able to withstand the added impact of turbine collisions."

17.4. Further to our comments dated 10 April 2025 and considering the additional WEFs in the surrounding landscape, we are now even more concerned about the cumulative impacts of these facilities on Oribi habitat, as expressed in the faunal assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area".

17.5. DFFE also requires that "the cumulative impact assessment for all identified and assessed impacts must indicate the following: (a) Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e. hectares of cumulatively transformed land". The Revised EIA Report does again not accurately quantify the size of the identified impacts, i.e. hectares of cumulatively transformed land. The overall footprint size of this, and all other similar proposed and approved renewable energy facilities within a 35 km radius is now 178 017.24 ha (Approved: 31 440.17 ha, In Progress: 89 247.96 ha, Pre-Application: 57 329.11 ha). Again, as a minimum, the cumulative impact of approved and in-process applications must be assessed.

17.6. As there has been no amendment in the revised EIA Report to the number of facilities identified surrounding this proposed facility, or a comprehensive comparative cumulative assessment undertaken, our previous comments on this matter dated 10 April 2025 remain unchanged, i.e. the cumulative impact assessment undertaken as part of this EIA does not adequately assess the cumulative impacts of this proposed facility, in relation to current and future similar renewable development facilities in the surrounding area.

18. Environmental Management Programme:

18.1. Our concerns related to the EMPr raised previously, still remain. The EMPr is unclear and vague, ambiguous, and does not provide adequate mitigation measures, timeframes, roles, responsibilities and reporting to adequately mitigate the potential impacts of this facility.

18.2. Given that we do not agree with the impact analyses undertaken in the EIA, the measures included in the EMPr as mitigation are, similarly, disputed.

18.3. The EMPr does not include a specific, measurable and timebound framework for decision-making regarding the duration of monitoring, and the specific circumstances for extension or curtailment.

18.4. The EMPr must be clear on when additional research is required.

18.5. Landowners must understand all access requirements and impacts associated with monitoring *throughout the lifespan of a project.*

18.6. Lease agreements must ensure that the effectiveness of monitoring is not compromised, and that restrictions do not compromise monitoring requirements in any way.

19. Biodiversity Offset Strategy:

19.1. According to the Biodiversity Offset Guideline, "*The desired outcome of biodiversity offsets is to ensure that - the cumulative impact of an authorised activity, or activities, and land and resource use change does not: result in the loss of irreplaceable biodiversity or jeopardise the ability to meet biodiversity targets; lead to any ecosystem with a threat status of Vulnerable or Least Concern becoming Endangered; or any Endangered ecosystem becoming Critically Endangered; or cause an irreversible decline in the conservation status of species and the presence of special habitats; or cause a significant loss in ecosystem services*". A biodiversity offset cannot therefore cater for the loss of Irreplaceable CBAs or intact grasslands. As detailed in the comments above, intact grasslands are crucial for supporting threatened fauna and avifauna.

19.2. The Biodiversity Offset Guideline specifically states that "biodiversity offsets are not appropriate when an activity, or activities, will have residual impacts on biodiversity of very high significance, including when residual negative impacts will result in loss of irreplaceable biodiversity".

19.3. In addition to Irreplaceable CBAs, the Biodiversity Offset Guideline also categorises the following as "irreplaceable biodiversity": Biodiversity of major potential concern, where residual impacts in this category could lead to – loss of vulnerable or potentially irreplaceable biodiversity in areas of recognised importance, such as – areas evaluated as having High Ecological Site Importance. We maintain that the correct and required implementation of the Species Environmental Assessment Guideline would have resulted in the Montane Grassland being classified as having High Ecological Site Importance.

19.4. The Intact Grassland Patches on the site must therefore be avoided, and cannot be offset. The requirement to consider biodiversity offsets is applicable only once it has been demonstrated that all measures of avoidance have been exhausted. The loss of irreplaceable biodiversity cannot be offset, and, as outlined above, "irreplaceable biodiversity" includes, key ecological corridors recognized as important for evolutionary processes and climate change adaptation where no options to safeguard these processes exist.

19.5. Furthermore, the Biodiversity Offset Report does not meet the following minimum requirements:

i. A portfolio of candidate biodiversity offset sites, including the likelihood of each site's availability and feasibility.

ii. The required biodiversity outcomes on each of the candidate biodiversity offset sites.

20. Public Participation:

20.1. In paragraph 9.3.3, it is stated that a "A comprehensive record of all comments received to date along with detailed responses from the Environmental Assessment Practitioner (EAP), specialists, and the project applicant is presented in the Comments and Responses Report (Volume II). For transparency and ease of reference, the original comments and corresponding responses are also appended to this volume". In your Public Participation Report (Volume III), it states that "During the DEIAR PPP comments were received from I&AP's. Follow-up e-mails were sent to all registered I&APs, stakeholders and authorities, and comments were received. Responses to comments received during the PP period are provided in Section 7, Table 7.1 below, with EAP / specialist / applicant responses, and the original comment and responses has been appended to the PP report which will be submitted with the FSR for DFFE decision".

20.2. However, in the copies of Emails included in the Public Participation Report, comments were submitted to you on 4, 9 and 10 April 2025 by: Megan Kim Govender; Adelma Vorster (Retsrov Boerdery) and Celine Oats (Richard Summers Inc.). *These comments have not been incorporated in your Comments and Response Report, nor have copies of the comments been appended to the Public Participation Report.*

20.3. Furthermore, a copy of the comments submitted to you by MTPA on 10 April 2025 have not been appended to the Public Participation Report, and have not been captured correctly in the Comments and Response Report (refer specifically to the list of flagged turbines).

Based on what has been outlined above, at least 17 of the 25 turbines proposed are located in unsuitable areas. In light of this, and in conjunction with the location of associated roads, OHLs and cabling in CBAs and avifauna and fauna high sensitivity areas, DARDLEA cannot support the application in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

15 August 2025

Dear Stephanie,

RE: COMMENTS ON THE ENVIRONMENTAL IMPACT ASSESSMENT PROCESS FOR THE PROPOSED EMVELO WIND ENERGY FACILITY AND SHEEPMOOR WIND ENERGY FACILITY [DFFE REFERENCE NUMBERS: 14/12/16/3/3/2/2611 & 14/12/16/3/3/2/2613]

1. INTRODUCTION

1.1. This document contains comments on the Environmental Impact Reports ("DEIRs") and associated Annexures for the proposed Emvelo and Sheepmoor Wind Energy Facilities ("WEFs") which were made available to interested and affected parties ("I&APs") during July 2025.

1.2. These comments are submitted on behalf of Mr. Josua Meyer a registered I&AP and owner of Portions 3, 4, 12 and 14 of the Farm Waaihoek No. 286, as well as Portions 4, 5 and 6 of the Farm Onverwacht No. 287, and Portion 7 of the Farm Windhoek No. 291.

1.3. Comments on the first version of the Draft EIA Report (March 2025) were provided within the commenting period timeframe of 30 days (i.e. by 10 April 2025) and covered both the proposed Emvelo and the Sheepmoor WEFs in a single report. ERM have released a second draft of the EIA Report dated July 2025 and the commenting period closes on 15 August 2025. The comments herein are supplementary to those made on the initial Draft EIA Reports of March 2025 and are not to be taken as substituting those earlier comments.

Reg No. 1999/069163/23
Vat No. 412 0186921

1.4. It must be noted that the comments, recorded herein, are based on a review of select items using examples primarily from the Sheepmoor Draft EIA Report and associated documents, but apply equally to the proposed Emvelo WEF. This is because the same approach has been adopted by ERM for both projects.

2. FLAWED PUBLIC PARTICIPATION PROCESS (PPP)

User unfriendly documentation places an undue burden placed on I&APs

2.1. As noted in our comments of April 2025, an undue burden is placed on I&APs in the context of being forced to comment simultaneously on the EIA documents related to these two proposed WEFs. This situation has not changed in relation to the current commenting period. Yet again, an undue an unreasonable burden is placed on I&APs to comment on two Draft EIA Reports for two separate applications for the projects located adjacent to each other and proposed by the same Applicant. The commenting periods run concurrently which effectively reduces the opportunity for meaningful public participation.

2.2. In fact, as is noted elsewhere in these comments, the sites of the proposed WEFs have changed, such that they overlap to some extent. This points to the fact that separating these applications is a ruse and that it is unjustified and unreasonable to treat these as two separate applications. It serves no logical impact management purpose and simply places an undue and undesirable burden on the EIA system – I&APs, the commenting authorities and the Competent Authority.

2.3. Also noted in our comments of April 2025, the PPP reports for the respective proposed WEFs are difficult to follow. This situation persists with the current reports– no discernible effort by the EAP has been made to make these documents more user-friendly in this 'second version' of the Draft EIA Report.

2.4. There is extensive duplication of the same correspondence, which makes it an arduous exercise to track the sequence of different activities undertaken and also the issues raised by I&APs (Appendix 6 of the PPP report). Some correspondence is repeated more than 10 times. It also makes it exceedingly difficult to find the original comments made by an I&AP. This adds to the unfair burden on I&APs and reduces the opportunity for meaningful public participation.

2.5. In certain instances, one cannot read the original comments in their entirety (i.e. read the full letter or email from submitted by an I&AP) as the original communication is not provided. Thus, in these cases comments are only available in a disjointed point-by-point fashion in a tabular format (i.e. Section 7 – Comments and Responses Report in Volume III - PPP Report), hereafter referred to as the CRR. This adds to the unfair burden on I&APs and reduces the opportunity for meaningful public participation.

2.6. The burden placed on I&APs is exacerbated by the fact that the EAP has not clearly indicated or described what has changed, such as which specialist reports have been revised or which sections of the Draft EIA Reports have been updated. In addition, the documents themselves

do not show where changes have been made through use of underlining or a different colour text. This means I&APs are faced with having to compare the two draft reports (version 1 with version 2) to ascertain what changes have been made. Clearly this is wholly unreasonable and constitutes unfair process.

DFFE requirements in respect of PPP not met

2.7. The requirement by the DFFE which were communicated to the EAP regarding inclusion of original comments have not been met (see Sheepmoor PPP Report, Section 7 - CRR, page 47).

2.8. DFFE stated that: "Copies of the original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity, must be submitted with the Final EIAr." If these comments are required for the Final EIR Report, then it follows that must also be available in the Draft EIA Reports. Examples of missing original comments are:

2.8.1. Most notably, the **original comments on the first version of the Draft EIA Report** (dated March 2025) from DARDLEA and MTPA **are not provided** in the CRR, which forms part of the suite of documents that make up the July 2025 Draft EIA Report. These comments were submitted on 10 April 2025 (as per the CRR), but the original submissions are not included in the PPP Reports. This is the case for both Emvelo and Sheepmoor. This has been fact-checked through searching for DARDLEA, 10 April 2025, April 2025 as well as scrolling through Appendix 6 of the CRR. The EAP is requested to explain this material omission.

2.8.2. The comments submitted by Richard Summers Inc. and MEGA on the March 2025 Draft EIA Reports are ignored and not included. Email communication dated 10 April 2025 from Richard Summers Inc to ERM confirming that comments had been submitted is included in Appendix 6 of the CRR (see pages 371 and 372 Emvelo CRR and pages 377-379 Sheepmoor CRR). Several searches of both CRRs have been conducted, using various search terms as well as scrolling slowly through the respective documents. **The comments are nowhere to be found**. The EAP is requested to explain this material omission.

2.9. The DFFE also required the following: "All issues raised and comments received during the circulation of the SR and draft EIAr from registered Interested and Affected Parties (I&APs) and organs of state, as listed in your I&APs Database, and others which have jurisdiction in respect of the proposed activity must be adequately addressed and included in the final EIAr" (see Sheepmoor PPP Report, Section 7 - CRR, page 46). This also has not been achieved:

2.9.1. The aforementioned comments from Richard Summers Inc are not recorded in the CRR tables in either of the CRR reports (See Section 7). This means they have been completely ignored.

2.9.2. The comments of 15 April 2025 from Mr Joshua Meyer are not included in the CRR tables in either of the CRR reports (See Section 7). Since this communication involved follow-up

on previous comments to which Mr Meyer had not received an adequate response, these comments ought to have been included. The relevant correspondence can be found on page 369 of Appendix 6 Emvelo CRR and page 375 of Appendix 6 Sheepmoor CRR.

2.9.3. Two landowners, of which at least one is a neighbour, requested inclusion as an I&AP. These requests were submitted on 9 April 2025 (Mr Braam Moodie) and 4 April 2025 (Restov Boerdery). Neither of these I&APs were afforded a fair opportunity to comment on the Draft EIA Report – they were simply provided with a link to the EIA documentation. There is no evidence of any effort by the EAP to afford them a meaningful opportunity to comment or to assist them in familiarising themselves with the proposed projects and associated EIA process.

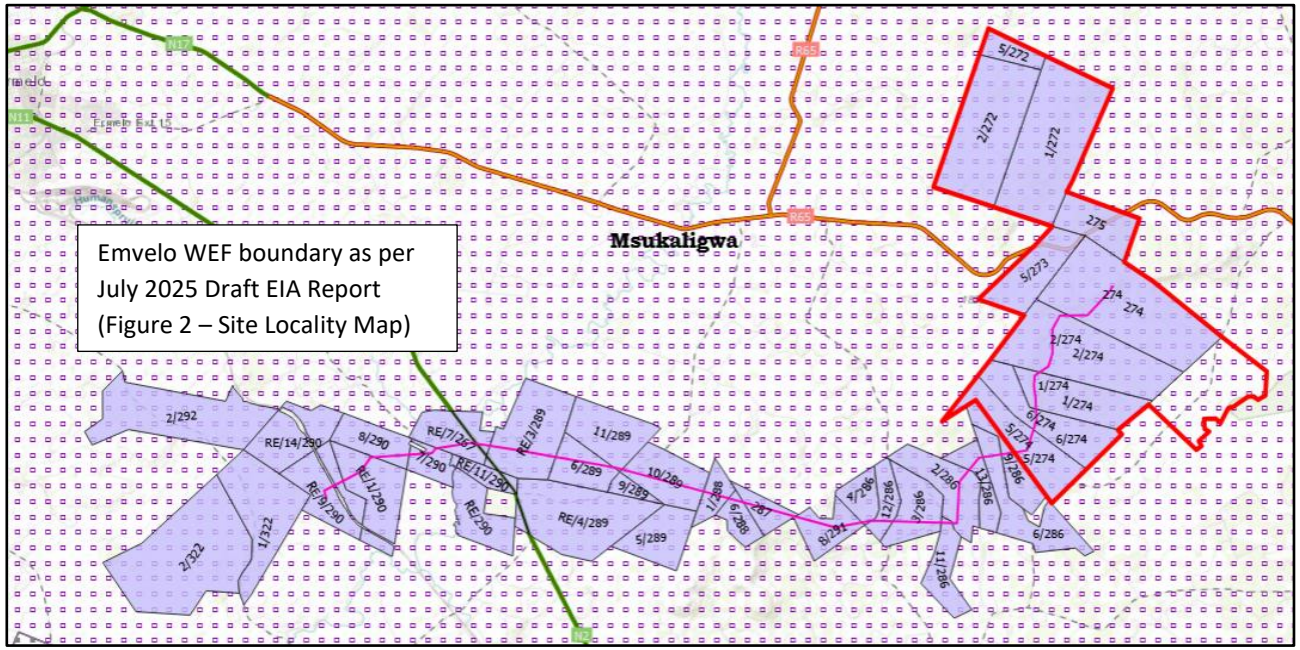
2.10. Whilst one of the uses of the CRR by I&APs is the ability to cross-reference a response from the EAP to the relevant section in the Draft EIA Report to see whether the I&AP's input was actually addressed (i.e. a change is discernible in the report) – this is of no use if an I&AP's comments are not recorded in the CRR first place. This is relevant because not all comments are recorded in the CRR. It therefore follows that these comments have not been considered at all.

3. INFORMATION PROVISION AND PRESENTATION

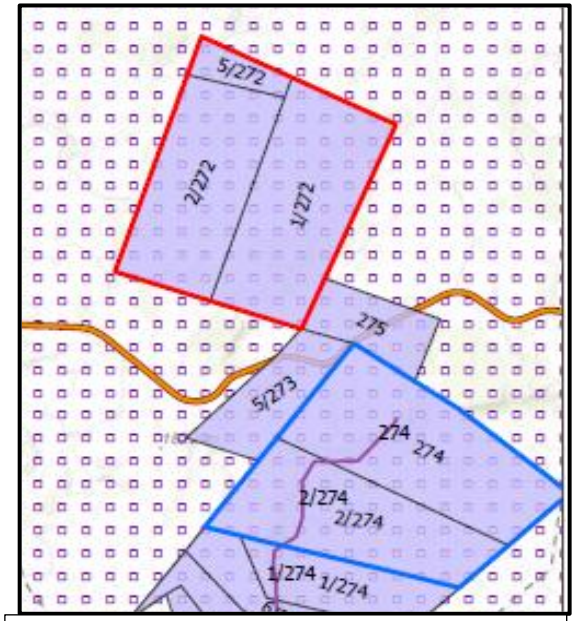
Confusing, unclear and poor-quality information

3.1. The site boundaries shown in the second version of the Draft EIR Report (dated July 2025) differs for both sites relative to the Draft EIA Report issued in March 2025. This is confusing and casts doubt on the accuracy of the information in the reports:

3.1.1. Portions 1, 6 and 5 of Farm 274, Farm Schiedamre are shown in the list of affected farm properties for both Sheepmoor (See Table 0.2) and Emvelo (See Table 0-2).

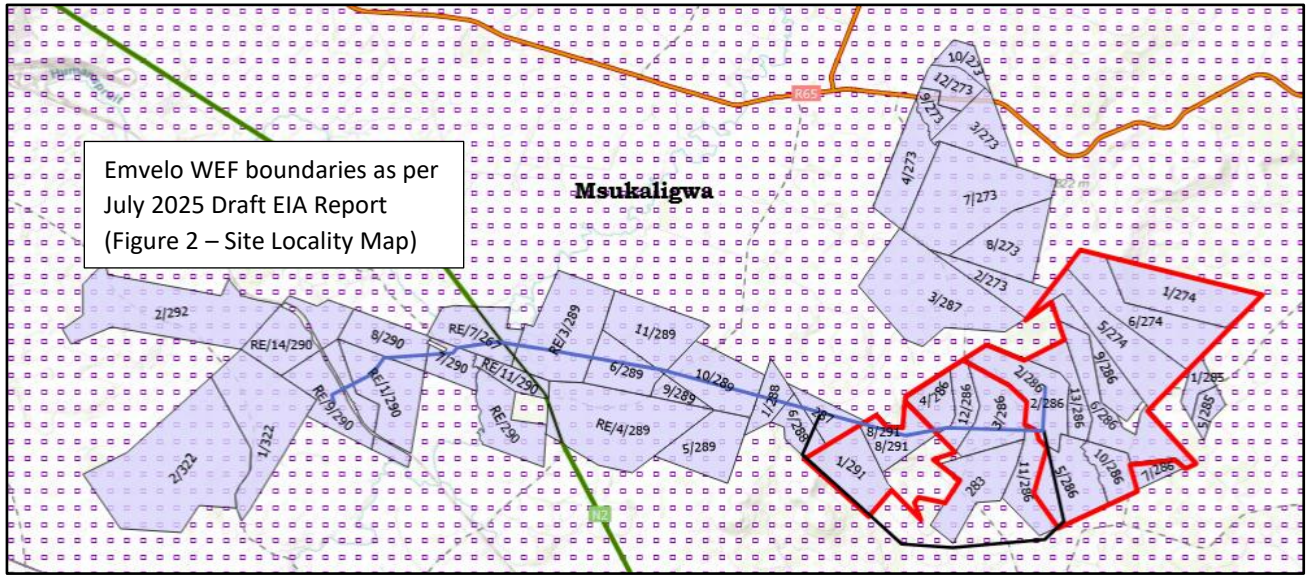


3.1.2. Further to the above, this is the case in both versions of the Draft EIA Reports, that is the March 2025 (Version 1) and July 2025 (Version 2), but the maps and diagrams in the March 2025 Draft EIA Report show a site boundary that does not include the aforementioned properties. This means that tabulated information (Table 0-2) in which affected farm properties are recorded for the proposed Emvelo WEF and the site boundary shown in diagrams and maps are different.

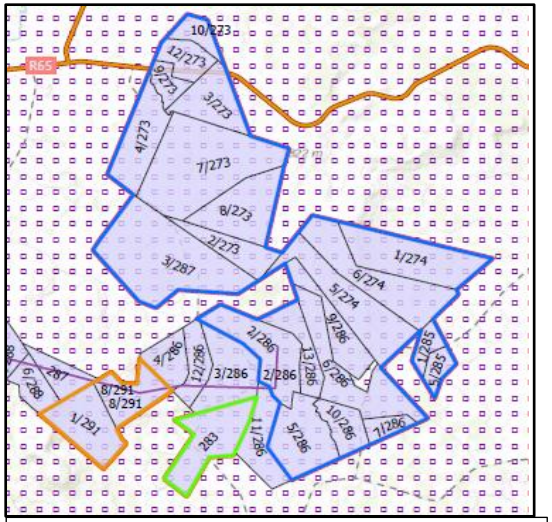


3.1.3. In addition, the site boundary for the proposed Sheepmoor WEF differs in the July 2025 Draft EIA Report, relative to that shown in the earlier version of March 2025. No explanation for the change is given. To add to the confusion, this change is not reflected in all of the maps / diagrams in the July 2025 Draft EIA Report. All of the figures in Section 6: Description of the Baseline Environment in the July 2025 Draft EIA Report show the old site boundary (i.e. as per the March 2025 Draft EIA Report).

3.1.4. The positions of WTGs on the overlapping farm portions (Portions 1, 6 and 5 of Farm 274,



Farm Schiedamre) is unclear. Neither a written description nor a combined diagram showing WTG positions associated with the respective projects on these parcels of land is provided and the project information is materially deficient.



3.2. The evidence for the situation described above is shown in the following diagrams and tables. Boundary coordinates are listed in the tables, which show that no changes have been made to this list of boundary coordinates (the example is taken from the Sheepmoor Draft EIA Reports) provided in the March 2025 versus the July 2025 reports.

Emvelo WEF boundary as per March 2025 Draft EIA Report (Figure 2 – Site Locality Map)

WEF boundary positions as given in Draft EIA Report dated July 2025 (Version 2)

3.3. The result of the situation as described in the foregoing points is that it is wholly unclear to I&APs as to what properties are affected by the proposed WEFs, what the extent of the respective proposed WEF sites actually is, how the two sites overlap in terms of infrastructure, WTGs and environmental constraints or sensitivities. Information which is materially deficient and reporting that is in such a state of disarray is not acceptable at the stage of a Draft EIA Report, which needs to be submitted as a Final EIA Report to the Competent Authority on 25 August 2025. It will not be possible to rectify these material omissions in that timeframe and any Final EIA Report submitted to the Competent Authority on this basis will be materially deficient.

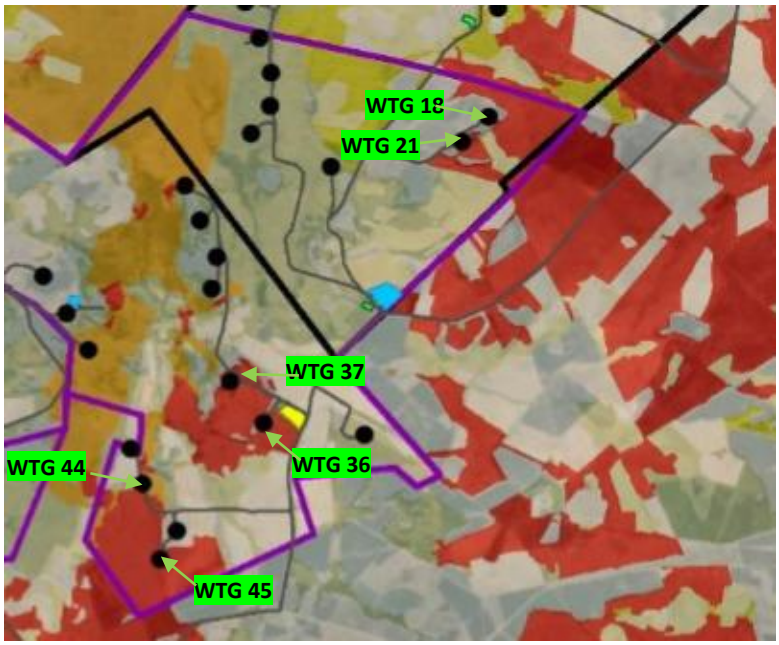
3.4. Based on responses from the EAP in the CRR, it appears the some of the WTGs may have been relocated / moved. These site layout changes are not detailed and the rationale for any such changes is not given in the project description. In fact, the Draft EIA Report is silent on the manner in which the layout has changed and the rationale behind these changes and which were made in response to environmental constraints or sensitivities. Such details and related information are central to determining if a concerted and authentic effort has been made to avoid adverse impacts, in accordance with the precautionary principle and the mitigation hierarchy.

3.5. Coordinates of the WTGs are not provided, and therefore reliance has to be placed on the figures (diagrams), to ascertain where the turbines and other infrastructure is located relative to environmental sensitivities. This makes it confusing for I&APs to appreciate if the impact assessment is informed by credible data. This is exacerbated by the fact that the figures provided by ERM in the March 2025 Draft EIA Report did not have labels on the WTGs because the WTGs are not numbered. This makes it exceedingly difficult for I&APs and the Competent Authority to correlate these figures with those in the July 2025 Draft EIA Report. The lack of WTG coordinate information undermines the ability of I&APs and the Competent Authority to establish whether the position of WTGs has changed in response to concerns about environmental sensitivities.

3.6. Given the foregoing concerns regarding the adequacy and accuracy of information relied on by the EAP and provided in the reports, no reliance can be placed on any statements about WTGs having been relocated / moved in response to noise, biodiversity sensitivities, cultural / heritage resource sensitivities and the like because spatial data shown on maps is confusing, boundaries have changed, the two sites overlap and diagrams and maps in reports have not been updated accordingly.

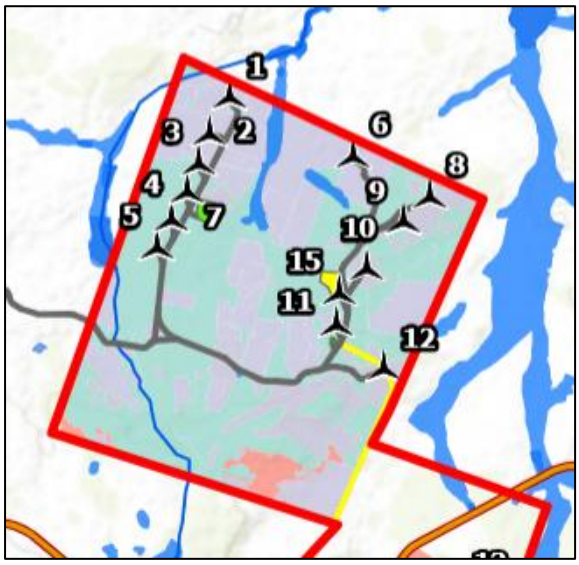
Assurances given in the CRR have no substance

3.7. In the CRR the EAP has offered assurances to concerned parties that WTGs have been moved / relocated away from sensitive areas. Unfortunately, there are instances where this contention is not borne out by the facts and data contained in the reports. Therefore it must be concluded that these assertions by the EAP must be treated with extreme caution by the Competent Authority.

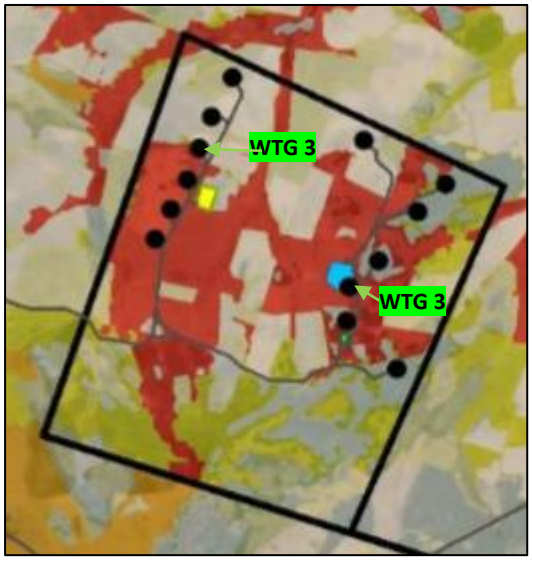


3.8. A specific example is the concern raised by DARDLEA about the location of WTGs in CBA: Irreplaceable areas, with specific mention of Turbine 45. In response the EAP has stated that

this turbine has been "relocated approximately 330 metres southward to ensure complete avoidance of the CBA: Irreplaceable area". Since the Figure 6 – Important Ecological Areas in the Draft EIA Report shows CBAs as a single entity (i.e. does not differentiate according to the CBA: Irreplaceable and CBA: Optimal categories as per the Mpumalanga Biodiversity Sector Plan (MBSP), it is difficult to verify this claim. The information is materially deficient and the Competent Authority, and I&APs are unable to determine – from the reports made available - if the claims made by the EAP are valid. There is too much uncertainty.



3.9. Accordingly, we considered the diagram on Biodiversity Offset Report prepared by WSP. This shows the CBA: Irreplaceable in accordance with the MBSP. It can be seen that in the case of the proposed Sheepmoor WEF, a number of WTGs fall within or right on the edge of CBA: Irreplaceable. WTG 45 remains located in CBA: Irreplaceable, despite the EAP's contention that it has been moved to completely avoid CBA: Irreplaceable.



3.10. The contradiction in the documentation is deeply concerning because it misrepresents the correct factual position on the ground. Furthermore, even if it was moved southwards as stated by the EAP, this would not resolve the situation, since CBA: Irreplaceable is present to the south of this turbine.

3.11. What is notable in the case of Sheepmoor is that there are other WTGs sited within CBA: Irreplaceable or on the edge thereof, besides WTG 45: Irreplaceable, namely WTGs 44, 36, 37, 21 and 18. A similar situation exists for Emvelo as can be seen from the WSP Biodiversity Offset Report – Figure 3-1.

WTGs located in CBA: Irreplaceable – Sheepmoor (extract from Figure 3-1 of the WSP Biodiversity Offset Report). According to the key associated with this diagram, red shading shows CBA: Irreplaceable.

3.12. The EAP states "the turbine and infrastructure layout has been revised in accordance with specialist recommendations, with a strong emphasis on avoidance of ecologically sensitive areas. All no-go areas identified by biodiversity specialists have been fully excluded from the final layout." (e.g. Sheepmoor CRR, page 24).

3.13. Concern was raised about WTG 15 being located in a Key Biodiversity Area (KBA) that is untransformed (page 15 Emvelo CRR). In reply the EAP states that WTG 15 was removed from the final layout. This is not the case! Examination of the extract from Figure 6 – Important Ecological Areas (from the figures volume attached to the July 2025 Draft EIA Report) shows that both WTG 3 and WTG 15 remain located in a CBA (green shading), albeit in a different position relative to the March 2025 Draft EIA Report. A construction camp is located next to the WTG and is also shown situated in a CBA. What is the explanation for this? Therefore, the relocation of WTG 15 does not seem to have offered any advantage from an avoidance of an adverse impact on biodiversity perspective. The lower image is extracted from the Biodiversity Offsets Report and it can be seen that both WTG 3 and WTG 15 are situated within CBA: Irreplaceable. Again, it appears that this is mere tick-box exercise by the EAP with no real intent to report accurately.

3.14. The status of the layouts that have been assessed by the EAP is unclear. Terminology is used loosely as shown in the examples below, taken from the July 2025 Draft EIA Report for the proposed Emvelo WEF. The same text is evident in the Draft EIA Report for the proposed Sheepmoor WEF, albeit that the page numbers are different. Examples include:

3.14.1. Page 9 of the Emvelo July 2025 Draft EIA Report under the topic Terrestrial Biodiversity, it is stated that "It is recommended that a final site walkdown be undertaken in order to inform the final layout design and inform micro-siting of footprints."

3.14.2. Yet the project description also references final layout design as not being finalised (page 2): "The proposed turbine footprints and associated facility infrastructure will cover an area of up to 185 ha after rehabilitation, depending on final layout design."

3.14.3. Then on page 13 on the topic of fauna, the following statement is made: "Final layouts of turbine placement, access roads, OHPLs, and other associated developments were provided by ERM on 30 January 2025. The final layout plans indicate that several wind turbines and access roads fall within areas of high faunal sensitivity" .

3.14.4. Page 28: "Prior to the submission of the final layout plan to the DFFE for approval….."

3.15. It is unclear as to what the final layout constitutes because as already noted, in the CRR the EAP makes reference to WTGs being moved in the "final layout". The reports are plagued with inaccuracies and contradictory statements. The credibility of the assessment process is doubtful as so many uncertainties prevail. IN this regard, the following questions arise:

3.15.1. If as noted by the terrestrial biodiversity specialist (for example), final layout plans were provided by ERM in January 2025, then is this the layout that was assessed for the purposes of the March 2025 Draft EIA Report? This is not clear at all from the reports made available to I&APs.

3.15.2. If concerns were raised by I&APs, specifically commenting authorities, about the layout plan presented in the March 2025 Draft EIA Report, and the EAP's response is that this has been resolved in the final layout, then which final layout is this? This is not clear at all from the reports made available to I&APs.

3.15.3. More importantly, why is there a disparity between the EAP's claim that WTGs and infrastructure has been moved / relocated (and thus, according to the EAP, the concerns about environmental sensitivities have been addressed). This is NOT the case. The figures presented in the July 2025 Draft EIA Report, which show definitively that this is not the case, with one or two exceptions (WTG 7 was moved due to the sensitivity of bird species 23).

3.15.4. Why is there reference to the need to do a walkover to develop a final layout and inform micro-siting of turbines and infrastructure, whereas the CRR creates the impression that micrositing has already been done?

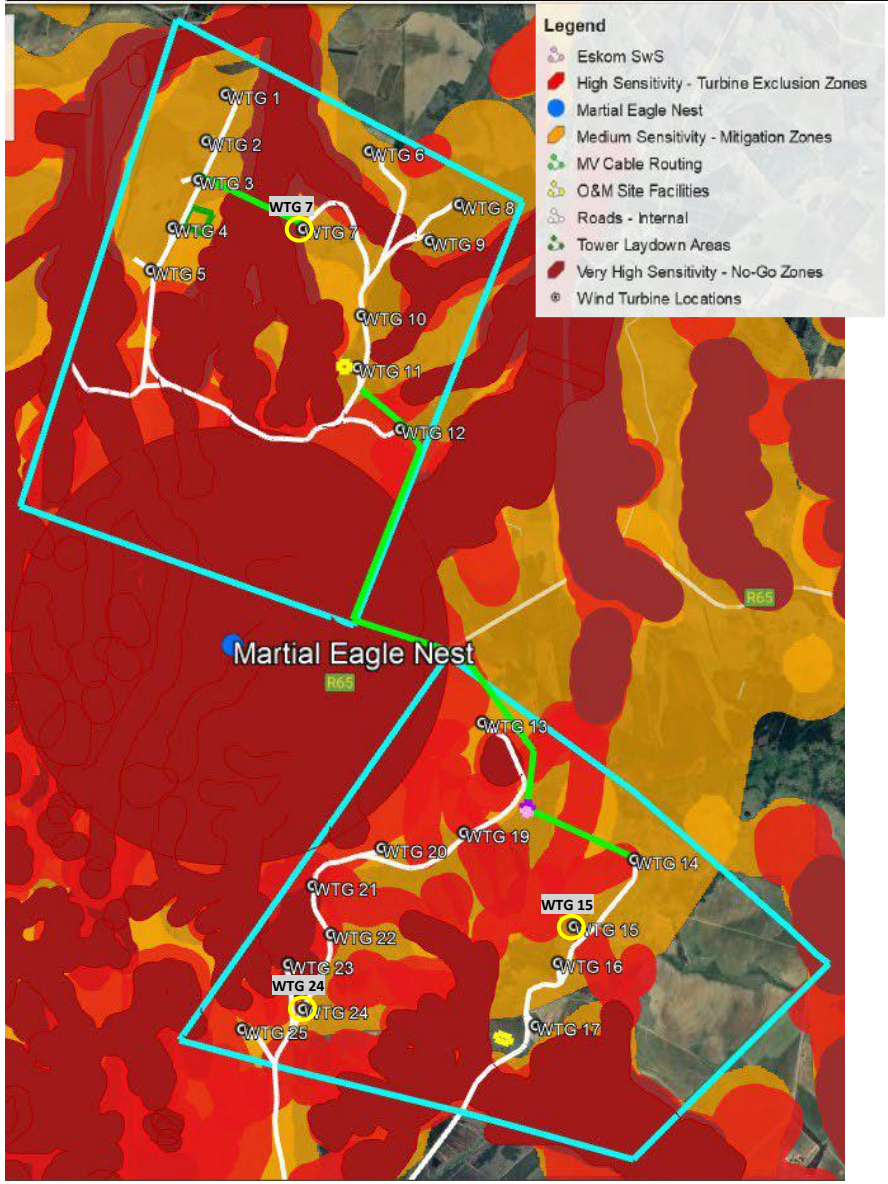
3.16. As evident from the foregoing discussion, as well as that in relation to avifaunal sensitivity, any assertion by the EAP that layouts have been changed, WTGs and infrastructure moved to avoid or reduce adverse impacts, are questionable. Such assertions must be interrogated by the Competent Authority and treated with caution. In fact, these claims cannot be relied upon and the manner in which information in this regard has been presented serves to compromise the entire EIA process. Moreover, it undermines the validity of significance ratings (over and above the weaknesses in the rating methodology highlighted in Section 4 of this document) pre-and post-mitigation.

4. INADEQUATE IDENTIFICATION AND ASSESSMENT OF IMPACTS

4.1. As noted in our previous comments (dated April 2025), the significance ratings of impacts reported by the EAP cannot be relied upon. It is inconceivable that in an environment that has so many highly sensitive environmental attributes, that not one single negative impact post-mitigation is rated more than being of 'moderate' significance. In general significance has been understated and this situation persists.

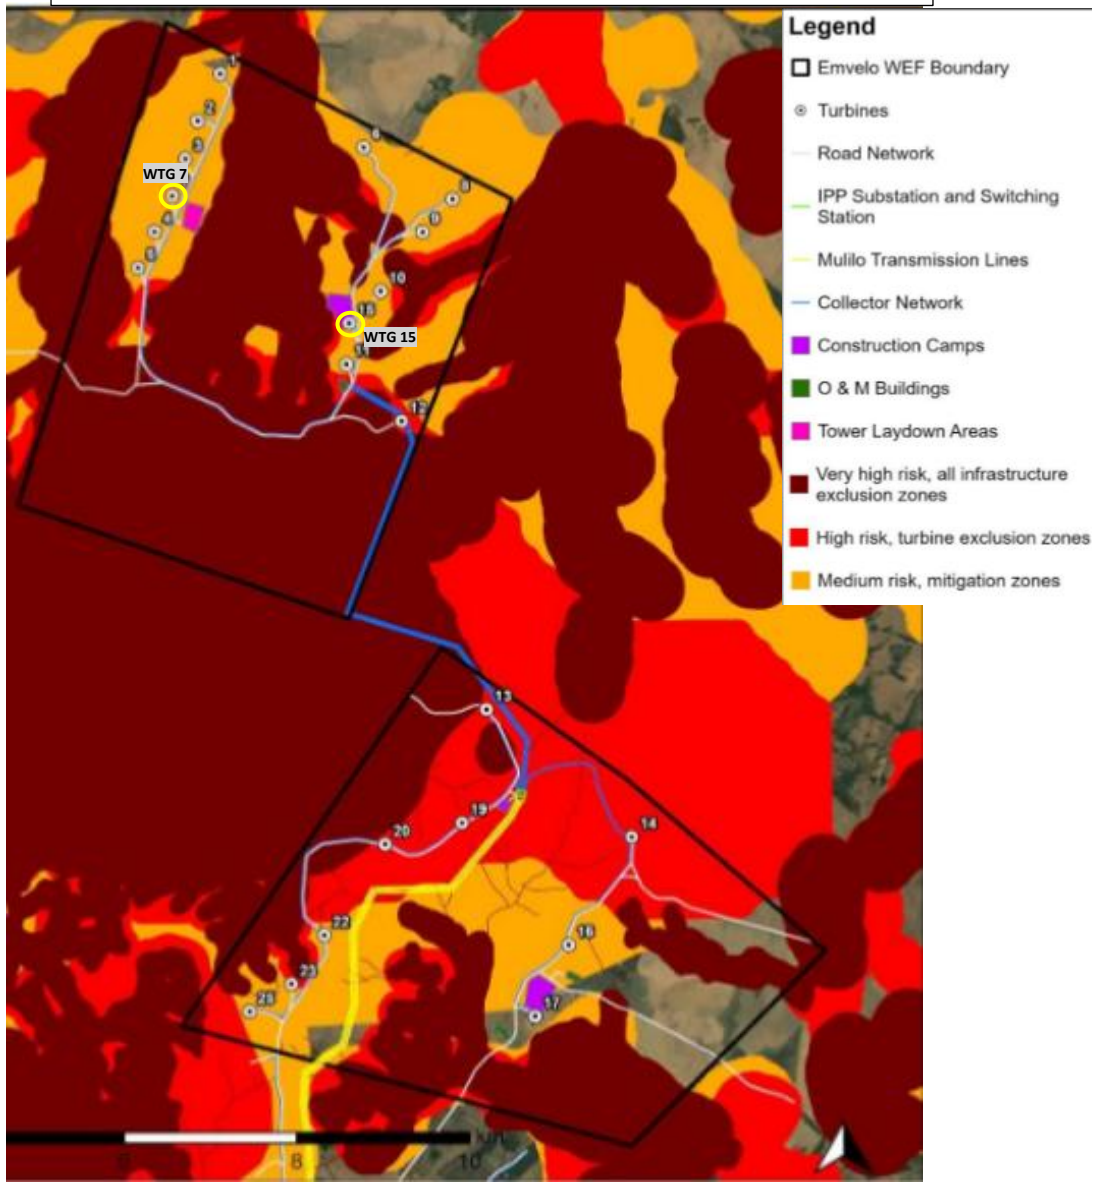
4.2. An example is the way the criterion "extent" is applied. To illustrate this point, avifauna is given as an example using the operational impact "Mortality due to Collisions with Turbines". The first problem is that all birds are considered as a single entity – there is no differentiation between Species of Conservation Concern versus other species. Where a species is listed globally as CE or E, then the extent of any impact that could cause mortality is a major concern at an international level and cannot be rated as medium in terms of extent. It is immediately apparent just from this single example of the criterion of "extent", that the result will be understatement of impact significance.

4.3. Impacts on policies and plans have not been assessed. For example, NPAES (National Protected Area Expansion Strategy) areas occur on the sites of both proposed WEFs. This is not shown on the sensitivity maps / diagrams. In addition, the impact on this strategy has not been assessed. Similarly, the potential impact of the proposed projects on conservation targets and objectives such as those expressed in the or on MBSP have not been assessed. There is also no indication that these types of policies, plans and programmes influenced impact significance rating.



4.4. The figures overleaf (extracted from Figure 39 of the Avifaunal Specialist Study) do show that WTG 7 was moved (in response to the sensitivity of Species 23). Relocation of WTG 15 as described in point 19 would seem to be disadvantageous in the context of Martial Eagle sensitivity. It is located closer to the Martial Eagle buffer (May 2025 Avifaunal Specialist Study) and also closer to the "Very high risk – all infrastructure exclusion zone". It is not known to what extent the relocation of WTG 15 was considered in the May 2025 Avian Specialist Study as no reference could be found to a specific discussion in this regard. Note that changed turbine positions are shown in yellow circles in the diagrams overleaf.

4.5. There are several WTGs that are still located within the Martial Eagle Turbine Exclusion Zone. These are WTGs 12, 13, 14, 19 and 20 are located. This was raised in the comments on the Draft EIA Report dated March 2025 (page 20 Emvelo CRR). In response the EAP states the following: "Noted. WTGs 12, 20 and 21 have been moved outside of the Avifaunal Turbine Exclusion Zone (Martial Eagle nest buffer), and WTG 13 has been micro sited to be located further away with the rotor swept area also not intersecting with this zone. This is simply not the case, which means this response by the EAP is **factually incorrect**. In fact, the specialist notes in his revised report (May 2025 – page 106) that these turbines need to be moved. Accordingly, the EAP has misrepresented the situation with regard to an extremely sensitive species.



4.6. Further to the above, fatality rate decreases described in the Avifaunal Specialist Study (Section 5.8.8) are open to question. It is unclear how the fatality rate for the Martial Eagle,

for example, can be predicted to reduce as much as described in of the specialist study, especially as the reduction of >50% is attributed to project layout changes. In the absence of specific details of what was changed so as to result in this predicted fall in fatality rates, together with clear diagrams showing 'before' and 'after' layouts, this conclusion cannot carry a high degree of certainty. This is particularly as the recommended buffer zone for Martial Eagles has not been adhered to (5-6 km not 2.5 km radius). Moreover, the layout itself does not appear to have altered so significantly relative to Martial Eagle sensitive areas so as to point to a substantial reduction in the threat of fatality. The following diagrams from the Avifaunal Specialist Studies provided with the Draft EIA Reports of March and July 2025 show that it is exceedingly difficult to discern layout changes that may have been in response to avifaunal sensitivities.

Combined Avian Sensitivity – Proposed Emvelo WEF (extract from Fig. 3.9 of February 2025 specialist study included in March 2025 Draft EIA

Combined Avian Sensitivity – Proposed Emvelo WEF (extract from Fig. 3.9 of May 2025 specialist study included in July 2025 Draft EIA Report

5. INADEQUATE APPLICATION OF THE MITIGATION HIERARCHY

Avoiding avoidance – the pinnacle of the mitigation hierarchy

5.1. One just has to consider the impact tables where one of the questions is: "Can impact be avoided, managed, or mitigated?" realise that the impact assessment methodology is based on a misconception of the mitigation hierarchy. The specialist response to the question "Can impact be avoided, managed, or mitigated?" is either "yes" or "no". There is no requirement to specify which mitigation strategy is being applied. Avoidance is different to management / mitigation, but the EAP makes no account for this. It is important to know whether the impact can be avoided as opposed to whether it can be mitigated. This ought to be explicitly explained by the EAP, but the EAP has failed to provide a rational explanation.

5.2. Avoidance is preferred and should always be considered before any other options in terms of the sequence of tiered steps mandated by the impact mitigation hierarchy. Definitively proving that avoidance has been implemented in accordance with the mitigation hierarch is something the EAP has categorically failed to establish.

5.3. The EAP's trend and preferred methodology – as shown in the Draft EIA Report - is to avoid 'avoidance' as the primary means for preventing adverse impacts in terms of the hierarchy. The EAP's approach flies in the face of IEM and the mitigation hierarchy because avoidance is assumed but not reflected in the project documentation. When working in such a sensitive environment, such as the sites of the proposed projects, it goes without question that AVOIDANCE should be top priority and a critical threshold to adhere to BEFORE proceeding to the following stages of the mitigation hierarchy. The role of the EAP is to ensure development is undertaken in a manner that ensures the interests of the biophysical environment and affected communities. This is an enormous responsibility and cannot be fulfilled if concerns raised by I&APs and conservation authorities are downplayed and effectively ignored. The impact assessment and public participation processes are materially inadequate.

5.4. Instead of avoiding areas of high sensitivity the EAP recommends pre-commencement flora relocation and faunal relocation (see for example page 384 Draft EIA Report). This is unacceptable and illustrative of a fundamentally defective approach to impact assessment and management. Areas of high sensitivity ought to be avoided outright in terms of the mitigation hierarchy. This has NOT been done.

5.5. There is no clarity of which species will be affected or whether they are good candidates for relocation (i.e. is the success of this proposed mitigation measure proven). The proposal to relocate species has associated impacts and these have NOT been assessed. In a scenario where relocation is unavoidable (i.e. all other options in terms of the mitigation hierarchy have been applied and exhausted) – **this constitutes a project impact and is not solely a proposed mitigation measure.**

5.6. It is stated "Several burrowing faunal species are present and will allow for relocation of less mobile species, although most faunal species in proximity are likely to vacate the area once

earth moving equipment commences clearing and construction, however some species may require manual relocation." Firstly, the way this proposal is framed is muddled / does not make sense. It reads like some sort of circular argument. Secondly, the impacts of relocation have not been assessed. Thirdly, once earth-moving equipment moves in, the project has commenced – which does not tie up with the proposed pre-commencement relocation of the sensitive species.

5.7. Inadequate thought has been given to relocation of plant and animal species, which results in the following unsubstantiated, bland and rather meaningless statement by the EAP: "They are relocated into a suitable habitat and protected from further damage and all disturbances to aid their re-establishment."

5.8. There are too many unanswered questions to place any reliance on this relocation proposal:

5.8.1. Have suitable alternative habitat locations been identified for relocation purposes? How far away are these and is the location accessible for this purpose? These questions are unanswered.

5.8.2. What is the impact of the faunal species that might be relocated? What about their wellbeing? These questions are unanswered.

5.8.3. How will they be caught so as to avoid trauma? Are they territorial species and if so, how will they be introduced into a new territory? How will faunal species in the new territory react? These questions are unanswered.

5.8.4. Has a faunal relocation expert been consulted? Where is the specialist input on relocation? These questions are unanswered.

5.9. The key priority and statutory obligation for an EAP is to determine whether a proposed project can respond to the environmental constraints present at the proposed location. This is the most important assessment and guidance that an EAP can provide. Instead, in this case, focus is placed on mitigation such as relocation of sensitive flora and fauna. It appears that little or no thought is given to the recipients or receiving environment of this relocation, as if one is dealing with environmental impact management is akin to dealing with inanimate objects.

5.10. There is also a disproportionate reliance placed by the EAP on reconsideration of WTG positions following a post-authorisation walkthrough. The question that has not been answered by the EAP is this: Why can such a walkthrough not be conducted during the EIA process when the specialists have been on site? Emphasis is placed on how much field work has been done, so why did this not include detailed examination of proposed WTG locations? For example (page 87 of the Emvelo CRR) concern is raised about the location of turbines and roads within Yellow-breasted Pipit habitat, contrary to the avifaunal specialist's recommendations. The EAP's response is "All WTGs were removed from Yellow-breasted Pipit habitat with the exception of WTG 23 that still appears to be fringing on a high-risk area as identified for the Yellow-breasted Pipit. It is recommended that this turbine position be

reconsidered following the avifaunal walkthrough, post-EA (should such EA be granted) prior to construction." It seems that WTG 31 (Sheepmoor) is also located on the edge of this bird's habitat.

5.11. There is reference to turbines having been micro-sited out of certain areas. See for example the Emvelo CRR (page 20) in relation to Martial Eagle. This raises the obvious question as to why micro-siting was not completed for all bird species and other environmental sensitivities. The maps are such that it is extremely difficult to discern whether the positions of turbines have changed, and this is due to lack of information on coordinates as mentioned elsewhere in this report. An explanation as to how the siting of WTGs was done is required. Was this done in field? When and how was micro-siting done? Were the edges between sensitive habitats and WTG positions verified in the field?

5.12. It is strange that if there is such precision about blade sweep and how far it extends and that it does not impinge into sensitive areas (see page 19 and 20 of Emvelo CRR) that more detailed diagrams / maps are not provided at a scale that clearly shows the difference between the before and after changes that have been made to the layout. Another example (page 36 of the Sheepmoor CRR) of this type of feedback is: "The Sheepmoor WEF has undergone significant layout refinement to avoid high-sensitivity areas, particularly Critical Biodiversity Areas (CBAs) and known flight paths of key species." Again, is one looks at the figures, it is extremely difficult to see any material difference in the layout.

5.13. Given the foregoing points, no reliance can be placed of assurances that the layout has been substantially changed and that micro-siting has been conducted. If this were the case, then the information presentation would be clearer, especially spatial information. Precise coordinates would be given of WTG positions before and after relocation, for example.

Misunderstanding of legal obligations – alien invasive legislation

5.14. Clearing of alien invaded areas is offered as a trade-off, at a ratio of 1:3 for direct loss of natural grassland habitat (as a trade-off or offset), in conjunction with other mitigation proposed by the terrestrial biodiversity specialist. This proposal is repeated many times in the Draft EIA Report for both proposed WEFs (e.g. page 32 Emvelo Draft EIA Report of July 2025). This proposal cannot be accepted as a trade-off or an offset. The reason is that this proposal is attached to the site of the proposed development, and the influence / impacts are not confined solely to the development footprint.

5.15. Furthermore, alien vegetation control is a legal requirement under the Alien and Invasive Species Regulations (GNR 1020 of 25 September 2020). As such, the meeting of a legal obligation cannot be used as a trade-off. Even if the WEF owner is not the same party as the landowner, this applies, because the WEF is being operated on that land. Thus, under the duty of care obligations under NEMA, the WEF operator is required to fulfil alien vegetation control obligations.

5.16. It may be argued that the WEF operator has no obligation to control alien invasive vegetation, especially that present prior to development. This is a weak argument because one of the

impacts associated with disturbance caused by the proposed development is the possible spread of alien invasive vegetation.

Misuse of biodiversity offsets

5.17. The proposed offset does not meet the required outcomes of the National Biodiversity Offset Guideline of 2023, which are that the offset outcomes must be ***practically measurable on the ground***. Importantly an offset must ensure that:

5.17.1. biodiversity is secured in the long term through the protection and appropriate management of ecosystems and species;

5.17.2. efforts to protect biodiversity in the long term contribute to the expansion of South Africa's protected area network, and are focused in areas identified as biodiversity priorities, with particular emphasis on the consolidation of protected areas and biodiversity priority areas and securing effective ecological links between priority areas; and

5.17.3. it contributes to the long-term security of biodiversity priority areas and maintains or improves their ecological condition, thereby resulting in tangible and measurable positive outcomes for biodiversity conservation 'on the ground'.

5.18. Internationally, research, capacity building, training and other activities are not recognised as 'offsets' but can be used to support, expedite, improve or bolster the outcomes required of an offset.

5.19. The offset report proposes various measures to deal with residual impacts on birds. Area-based offsets are not feasible; several offsite actions have been proposed in an effort to achieve no net loss of these species. How no nett loss of bird species through these measures is to be achieved is wholly unclear. Furthermore, since WEFs pose a threat of bird deaths the loss of a single bird within the category of a species categorised as Critically Endangered or Endangered is one too many and pushes the species ever closer to a tipping point.

5.20. 13.7 ha of the 31 ha total residual impacts are in CBA 1 which is, by definition, **IRREPLACEABLE** and constitute a **FATAL FLAW** as noted in the national offset guideline. i.e. 44% of the proposed footprint. Also, it is in a NPAES focus area (Fig 3.1 of the WSP Biodiversity Offset Report).

5.21. **No assurance that land can be secured for conservation**, and **no assurance of long-term protection of a possible offset area is provided**. There is passing mention of 'may' look at conservation servitudes, but that is all." To suggest that Mulilo can motivate to the lessor that the offset plan is part of "maintenance and repairs" is wholly unacceptable and nonsensical.

5.22. **Furthermore, suggesting that target areas be identified in the context the existing site due to having lease agreements in place is counter to the intention of offsets. This land is within**

the proposed project's sphere of influence – so it is in fact not an offset as applied internationally and as understood in the aforementioned national guideline.

5.23. There is no clarity on responsibility for managing the offset area(s) (i.e. who would implement the offset and do the work) and covering costs of the offset, and duration of liability. Talking about clearing of alien species 'in a (questionable) ratio of 1:3' as a 'trade-off or offset' is nonsense. Any offset site would need to be cleared of alien species as an integral part of its management.

5.24. Of the **proposed offset measures for birds** (Section 10.2 in Biodiversity Offset report) – only the bird flight diverters may be acceptable BUT evidence that this would translate into on-the-ground outcomes is required (i.e. improvement in bird populations commensurate with expected residual impacts/ reduction in numbers due to electrocution/ collision with turbines/ powerlines). These outcomes must be directly linked to the affected species. Furthermore, no basis is given for specifying 5000 bird diverters every 10 years.

5.25. Support of research programmes are not recognised as an offset.

5.26. All of the items listed are in fact what a responsible corporate citizen ought to be doing and therefore do not constitute a praiseworthy offset (see point 53 below), particularly in circumstances where the mitigation hierarchy has not been applied. The first or top priority in the mitigation hierarchy is to avoid the adverse impact in the first place. This is precisely the mitigation approach that has been avoided in the EIA process for these proposed WEFs. Avoidance would mean removing any WEFs that is within away from bird sensitive areas on the basis of the precautionary principle – meaning do more than the minimum. For example, if there is a general guideline buffer applicable to nest areas, then application of the precautionary principle would mean adding to this buffer, because of the uncertainties about bird movements, for example.

5.27. The use of an offset demonstrates that there are residual adverse impacts, which means that the project has significant adverse impacts associated with it. It is not proactive compliance as espoused by the EAP. "This BOR is not a reactive add-on; it reflects a proactive compliance, demonstrating that the project has embraced its environmental responsibilities. Significant resources, technical input, and time were invested to ensure the offset plan would stand up to scrutiny and deliver real conservation value. It is a key part of what gives this project its integrity, and the applicant is proud to include it as a cornerstone of the DEIR submission. It should provide the competent authorities with a clear assurance that residual impacts have not only been recognised, but systematically addressed, avoided where possible, and responsibly offset where unavoidable." Besides the fact that the foregoing paragraph is verbiage, it is also factually incorrect. This type of language is wholly inappropriate – the language is not objective and compromises the independence of the EIA process.

5.28. Additional comments and concerns regarding the Offset Report prepared by WSP include:

Re: Section 3.1.2 PRIORITY AREAS FOR PROTECTED AREA EXPANSION

5.28.1. How has this section influenced the need for and design of any offset? This information would have and should have been evident during project planning and should have triggered upfront offset development at the earliest stages of the design process. What was this not investigated by the EAP before the 11th hour of the EIA process?

Re: 3.2.1 ECOLOGICAL IMPORTANCE OF VEGETATION COMMUNITIES IN THE LSA

5.28.2. The applicable Guideline suggest that impacts on CBAs should be AVOIDED AT ALL COSTS, unless the CBA can be shown to be inaccurately mapped or otherwise wrongly determined. The actual drivers of why the area is designated a CBA are important in terms of understanding the impact, requisite offset (if possible) and offset design to accommodate the feature driving CBA.

Re: Figure 3-7 - Sheepmoor Vegetation Sensitivity

5.28.3. It is curious (and inexplicable) to note that the areas in green are mapped as only moderate sensitive - although from an avifaunal perspective many areas are rated High or VERY HIGH. Offsets must synthesize the full array of features to derive a trigger but this has not been undertaken by the EAP.

Re: Section 5 AQUATIC BIODIVERSITY OVERVIEW

5.28.4. It is not clear whether there are any significant impacts on wetland systems (for instance from stream crossings by access roads or buried power lines) and whether these may trigger wetland offsets? This is unresolved and unanswered. The gaps in information and inadequacy of the assessment and it is not possible for the Competent Authority to render an informed decision on such impacts.

Re: Section 6.1.2 FLORA

5.28.5. EAP to confirm whether this is the first time a footprint figure has been made available during the EIA process. If so, why is this information made available at the 11th hour only?

5.28.6. There is no table of impact areas by feature, with a clear indication of what ratio should be applied. In order to determine a final offset quantum that can be audited for compliance monitoring the relevant information is not tabled. How much invaded area needs to be cleared? This is not clear from the reports. How is it to be rehabilitated to secondary grassland? This is not clear from the reports. Does this qualify as an acceptable offset for loss of intact grassland? If so, why? Again, this is not clear from the reports.

5.28.7. There is no map to determine whether it is feasible compensate for loss of secondary grassland in corridors between intact patches that are ESA designated – but the EAP states:

"this impact to negligible levels with only a very small proportion of the footprint occurring in or near higher sensitivity areas. Very High Sensitivity or No- Go habitat has largely been avoided and reduced to an acceptable level."

5.28.8. The above contradicts what the Avifauna report says or the fact that there are impacted CBAs and ecological corridors and processes. only valid for narrow vegetation lens. What is the total footprint of these areas impacted? Who is able to determine whether the impacts significance is acceptable without the material underlying data which has not been made available?

Re: Section 6.1.3 FAUNA

5.28.9. Agreed. This requires a clear and compensatory offset. i hope it still is to be clarified how much and where? could the OHPL be constructed without a service road? It seems unlikely

5.28.10. In this finely dissected landscape, with no-go areas immediately adjacent to low sensitivity, micro-siting would seem vital to have been completed before arriving at an impact statement and an estimation of footprint and offset liability. This is a key and material flaw in the entire EIA process. This weakness in impact assessment methodology flies in the face of IEM and the mitigation hierarchy.

5.28.11. The report relies on an indefinable and this un-auditable requirement and is fatally flawed.

Re: Plant Species page 410

5.28.12. Any loss of intact or degraded grassland habitat in corridors or wetland catchments cannot be rated as a positive impact!

Re: Table 9-2 – Terrestrial habitat offset targets

5.28.13. How does this relate to the 180 ha indicated in the report above? This is an unacceptable impact. fully 40% of the impact is in CBA1 ?

Re: Section 10 CANDIDATE OFFSET SITES

5.28.14. There is no candidate list, or any credible analysis of the contribution of each? do sufficient sites exist? are the landowners amenable to having their activities curtalied?

5.28.15. There is no evidence these lease conditions include restriction of farming activities and proactive biodiversity management. When were they signed, and has proof been submitted to the authorities?

5.28.16. Much of the assessment is entirely theoretical. Actual offset sites need to be identified and the specifics of their rehabilitation are determined to assess functional gains before

a decision can be made. More specifics would have helped the decision maker here regarding the biodiversity impacts

5.28.17. Rehab of grasslands is difficult and expensive, and often incomplete/inconclusive. restoration is likely impossible - especially to achieve prior diversity levels and structure, and keep invasive and alien species out.

Re: Section 10.1 SIGNED LEASE AGREEMENTS

5.28.18. The mooted lease agreements are likely to be contested by the landowners. A dedicated offset lease agreement and servitude - with accompanying management plan setting out the requisite outcomes - should have been concluded with the sites but this has not been done. . All of these proposed offset areas will be adjacent to the WEF/ WTG and this is questionable in terms of offset efficacy.

5.28.19. There is little indication of competing interests which might undermine potential offset efficacy e.g. Mining & Prospecting Rights, and the limits that these rights might impose on the applicants' ability to attain offset outcomes

Re: Section 11 10.2 OFFSITE ACTIONS FOR PRIORITY BIRD SPECIES

5.28.20. None of the actions listed qualify as offsets, or are so insufficiently described as to be so vague and meaningless that it is impossible to link the action directly to an impact (which methodology is expressly prohibited by the Offset Guideline). The reason being that the impact is not quantifiable and is unauditable based on the available information.

Re: Section 11 RECOMMENDED CONDITIONS FOR ENVIRONMENTAL AUTHORISATION

5.28.21. The quantum needs to be specified here, but it isn't quantified. The final status and/or protection and management regime need to be confirmed but this information has not been made available

5.28.22. There is insufficient information to demonstrate that the landowner has consented to the proposed arrangement. It is also not clear how certain this outcome is and whether this is covered in the lease conditions.

Re: Section: AFFECTED TERRESTRIAL HABITATS

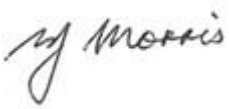
5.28.23. This assessment is meaningless unless attached to a specific infrastructure element, which it is not. In the circumstances, the DFFE is unable to determine accurately what the offset liability is should they choose to only approve a portion of the project

The reliance on micro-siting

5.29. Whilst post-approval micrositing is applied internationally in the wind energy sector, this is

within very specific limitations. According to Scottish Natural Heritage[1], for example, the siting of wind turbines in small incremental distances and is used at two main stages of wind farm development:

5.29.1. Firstly, during the design stage to ensure that turbine layout is satisfactory from key viewpoints and achieves the design objectives.



5.29.2. Secondly, during the construction phase of a project, where previously unexpected conditions are encountered on site.

5.30. Provision for micrositing is normally covered by a specification in the EIA Report which can then be included in the conditions in the approval. This serves to set a limit within which micrositing is permitted and normally limits this to 50-100m from the specified (approved) turbine location. This information ought to be known to ERM South Africa, since exactly this approach is applied by the company in the UK (for example Crosbie Wind Farm.[2]

5.31. From the foregoing information it can be seen that micrositing is not to be applied in a non-specific manner. It is recognised that some flexibility is required in final design stages and also to allow for unforeseen circumstances during construction. It is standard and accepted practice internationally to specify a distance limitation within which micrositing is permitted. This must of course be included in the project description and included in the impact assessment. This way, I&APs and the Competent Authority are provided with a full picture of the potential development footprint (including the micrositing zone) and the associated footprint. More importantly, it means the Competent Authority has full information and can include a specific zone for each WTG within which micrositing is permissible. Hence, this is clear and known to the Competent Authority upfront from the provision of this information in the EIA Report, instead of being faced with an unknown quantity in terms of

Dear Specialist,

I trust you are well.

Please find attached the final layout for the proposed Amsterdam WEF as received from the applicant. Kindly update your respective specialist reports to reflect this final layout, and to submit your revised reports by Monday, 12 August 2025.

If, for any reason, you anticipate that you will not be able to meet this deadline, please inform me as soon as possible so that we can explore alternative arrangements.

Thank you for your continued support and contributions to the project. Should you have any questions or require any additional information, please don't hesitate to reach out.

Kind regards,

REVISION 1

Executive Summary

ERM Southern Africa (Pty) Ltd appointed EnviroSci (Pty) Ltd to conduct an aquatic assessment of the proposed Mulilo Amsterdam Wind Energy Facility cluster between Ermelo and Amsterdam in the Mpumalanga Province. This report is focused on assessing the Sheepmoor Wind Energy Facility and its associated Overhead Line allignment

This assessment includes delineating any natural waterbodies, as well as assessing the potential consequences of the proposed project – The study area) on the surrounding wetlands and or watercourses. This was based on information collected during various site visits conducted within the region from March 2022 and a site-specific assessment in April & September 2023. Substantiated by the National Wetland Inventory v5.2 spatial data (NWI). Additional site visits were conducted in February 2025, while working in the region to confirm any changes since the initial surveys.

These surveys adhered to the assessment criteria contained in the DWAF 2005 / 2008 delineation manuals and the National Wetland Classification System. This report will inform the Environmental Authorisation process, as well as the required Water Use License Application that will be initiated, once the final project layout is available, i.e. once all the constraints, if any from this and other specialists have been considered in the design process.

The PROTOCOL FOR SPECIALIST ASSESSMENT AND MINIMUM REPORT CONTENT REQUIREMENTS FOR THE ENVIRONMENTAL IMPACTS ON AQUATIC BIODIVERSITY (Government Gazette 43110, 20 March 2020), superseding the Appendix 6 NEMA requirements, was also adhered to as results of the DFFE Screening tool indicated that portions of the study area are located within a VERY HIGH SENSITIVITY area, requiring this assessment. This is due to following being highlighted by the DFFE Screening Tool Results:

- Very High CBA: Aquatic rivers
- Very High CBA: Wetlands
- Very High ESA: Important sub catchments
- Very High ESA: Strategic Water Source Area (SWSA)
- Very High ESA: Wetland clusters
- Very High ESA: Wetlands
- Very High FEPA Subcatchment
- Very High Rivers_AB
- Very High Rivers_B
- Very High Rivers_C
- Very High SWSA (Surface Water) _Upper Usutu
- Very High SWSA (Surface Water) _Upper Vaal
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Seep)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Valley-bottom)
- Very High Wetlands_Mesic (Riverine)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Depression)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Floodplain)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Seep)

The proposed Wind Energy Facility (WEF) is located in a portion of the Inkomati-Usuthu Water Management Area, within the upper catchment of the Mpama River (SQ W53) and the Sandspruit (SQ W53A) and the proposed grid connection options are located in the Upper Vaal River (SQ C11B) in the Vaal Water Management Area. Thus, several permanent rivers and a variety of wetland hydrogeomorphic types are anticipated both associated with the riverine valleys and bench or plateaux areas located between river valleys on higher lying areas.

The study region is further characterised by several National Biodiversity Assessment (2018) Wetland Clusters, National Freshwater Ecosystem Area (NFEPAs), Threatened Ecosystems and Strategic Water Resources Areas.

The geology is mostly shales or sandstone of the Vryhied Group, with several intrusions associated with dolerite sills and dykes in areas associated with the Karoo Supergroup. This typically allows for the development of riverine areas, some with floodplains, interspersed by the rocky inselbergs and small ridges and or bench / plateaus observed.

Overall, these catchment and subsequent rivers / watercourses and wetlands range from a Largely Natural to transformed states. Current impacts occur in localised areas and included the following:

- Mining
- Large scale farming
- Forestry
- Erosion due small road crossings and tracks;
- Grazing; and
- Small to large river impoundments, and off channel farm dams.

In terms of the National Freshwater Ecosystems Priority Areas (NFEPA) assessment, all the watercourses within the site have been assigned a condition score of C (Nel et al. 2011), indicating that they are Moderately Modified, but still have biological significance, while the NBA (2018). These scores were substantiated by observations made in the field within the study area, and due to the impacts or disturbance observed these scores would be upheld.

Any ratings will the also be substantiated with an assessment of the study area catchments linked to Critical Biodiversity Areas (CBA) and Ecological Support Areas, as shown in the Mpumalanga CBA spatial data.

The National Freshwater Ecosystems Priority Areas (NFEPA) (Nel *et al*., 2011), also earmarked sub-quaternaries, based either on the presence of important biota (e.g. rare or endemic fish species) or conversely the degree of riverine degradation, i.e. the greater the catchment degradation the lower the priority to conserve the catchment. The important catchments areas are then classified as Freshwater Ecosystems Priority Areas (FEPAs). The study area falls within several FEPA and Upstream FEPA catchments associated with the Usuthu & Vaal river systems. This is large due to the presence of several important fish and aquatic invertebrate habitats that as well as the provision and maintenance of flows within the lower catchments.

This report also indicates the significant watercourses and wetlands delineated within the study area, inclusive of the respective buffers. Any activities within these areas and or the 100m (riverine) 500m (wetland) regulated zones will require a Water Use license under Section 21 c & i of the National Water Act (Act 36 of 1998). The respective Water Use Licenses must be finalised once the preferred layout has been determined especially if any access roads will need to cross these areas, but it is advised that any new crossing over watercourses and wetlands areas are avoided.

Using the baseline description, aquatic features were identified, then categorised into one of number pre-determined sensitivity categories to provide protection and/or guide the layout planning processes. The sensitivity ratings of High (No-Go) to Low were determined through an assessment of the habitat sensitivity and related constraints. However, these No-Go areas (with buffers) relate in general terms to the project and there are areas where encroachment on these areas would occur (i.e. existing road crossings within systems) and this is considered acceptable since these areas are already disturbed.

These proposed constraints / buffers do not include bird buffers / constraints as theirs buffers along aquatic features are at times far larger around aquatic features, than those required for the known aquatic species within this region.

Development Component	Habitat type	Sensitivity rating of the respective habitat type against the development type	Buffer distance (m)	Development acceptability	Sensitivity rating override if an impact such as a road or other disturbance already occurs within the proposed footprint and confirmed by the specialist
WTG towers	Channelled Valley Bottom Wetlands	No-Go	105m	No WTGs should be placed in any of these areas, regardless of the state, type and functionality of the respective aquatic ecosystem	None
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		
Hardstands, Buildings / Substations & BESS	Channelled Valley Bottom Wetlands	No-Go	105m	None of these types of infrastructure should be placed in any of these areas	None
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		
Roads & Underground cables alignment roads	Channelled Valley Bottom Wetlands	High	105m	New roads and underground cables would not be deem appropriate within any of these areas, unless some form of disturbance already occurs, such as an existing track or bridge	Only existing tracks or disturbed areas may be used
	Pans and Depressions		95m		
	Rivers and Floodplains				
	Seeps		65m		
	Minor watercourses		35m		

Development Component	Habitat type	Sensitivity rating of the respective habitat type against the development type	Buffer distance (m)	Development acceptability	Sensitivity rating override if an impact such as a road or other disturbance already occurs within the proposed footprint and confirmed by the specialist
OHL	Channelled Valley Bottom Wetlands	High	105m	OHL towers must be placed outside of these area so that only the cables span these systems. The exception being that Pans & Depression inclusive of buffers must be avoided completely	
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		

In summary, any structures such as turbines/towers, crane pads, hardstands, buildings, substations and BESS, have been placed outside of the observed Very High Sensitivity watercourses, while any remaining structures (Roads and transmission lines) could cross or span the other sensitivity areas. Noting Low Sensitivity = Moderate areas but with existing impacts e.g., current roads, farm tracks of previously disturbed areas

The following direct impacts were assessed with regard the aquatic systems in this impact assessment phase based on the assumptions that any of the delineated Very High no-Go sensitivity areas shown in this assessment will either be avoided by the WEF components or spanned by the grid connections, noting that some access roads must cross some of these areas, but should preferably be within previously disturbed areas:

- Impact 1: Loss of habitat containing protected species or Species of Special Concern
- Impact 2: Loss of any critical corridors, important catchment areas and connected habitats that are linked to any Critical Biodiversity Areas or Ecological Support Areas
- Impact 3: The potential spread of alien vegetation
- Impact 4: Loss of riparian and or wetland habitat
- Impact 5: Changes to the hydrological regime and increased potential for erosion
- Impact 6: Changes to water quality
- Impact 7: Cumulative Impacts

During this assessment, several sensitive aquatic habitats were observed and are shown in the maps provided in this report. Noteworthy areas, were then avoided by the required infrastructure, and include the main riverine and wetland systems, while the access roads will make use of existing roads thus previously disturbed areas as far as possible, especially near or when need to span aquatic systems.

If this is carried out, then the specialist has no objection to the authorisation of the proposed activities assuming that all mitigations and buffer zones are implemented.

Mitigation should focus on these areas and include measures to halt erosion and rehabilitate habitat in the sections affected by the construction. Without the implementation of mitigation measures, the project has potential to cause a Moderate cumulative impact upon aquatic biodiversity. However, with the adoption of mitigation, the proposed project will have a Low impact upon aquatic biodiversity.

As the proposed activities have the potential to create erosion the following recommendations are reiterated:

- Vegetation clearing should occur in a phased manner in accordance with the construction programme to minimise erosion and/or run-off. Large tracts of bare soil will either cause dust pollution or quickly erode and then cause sedimentation in the lower portions of the catchment, and suitable dust and erosion control mitigation measures should be included in the generic EMPr, if not included already to mitigate.
- All construction materials including fuels and oil should be stored in demarcated areas that are contained within berms / bunds to avoid spread of any contamination / leaks. Washing and cleaning of equipment should also be done in berms or bunds, to trap any cement / hazardous substances and prevent excessive soil erosion. Mechanical plant and bowsers must not be refuelled or serviced within or directly adjacent to any channel. It is therefore suggested that all construction camps, lay down areas, batching plants or areas and any stores should be located more than 50 m from any demarcated watercourses.
- It is also advised that an Environmental Control Officer (ECO), with a good understanding of the local flora be appointed during the construction phase. The ECO should be able to make clear recommendations with regards to the re-vegetation of the newly completed / disturbed areas along aquatic features, using selected species detailed in this report.
- All alien plant re-growth must be monitored and should these alien plants reoccur these plants should be re-eradicated. The scale of the operation does however not warrant the use of a Landscape Architect and / or Landscape Contractor.
- It is further recommended from the project onset that all watercourse areas (inclusive of buffers) are included into any existing EMPr as reference, this to ensure a net benefit to the aquatic environment. This should from part of the suggested walk down as part of the final EMP preparation.

SPECIALIST REPORT DETAILS

Report prepared by: Dr. Brian Colloty Pr.Sci.Nat. (Ecology) / Member SAEIES.

Expertise / Field of Study: BSc (Hons) Zoology, MSc Botany (Rivers), Ph. D Botany Conservation Importance rating (Estuaries) and interior wetland / riverine assessment consultant from 1996 to present.

I, Dr. Brian Michael Colloty declare that this report has been prepared independently of any influence or prejudice as may be specified by the National Department of Environmental Affairs and or Department of Human Settlement, Water and Sanitation.

Signed: ..... Date:15 August 2025.....

Appendix 1 of this report contains a detailed CV

This document contains intellectual property and proprietary information that is protected by copyright in favour of EnviroSci (Pty) Ltd. The document may therefore not be reproduced, or used without the prior written consent of EnviroSci (Pty) Ltd. This document is prepared exclusively for ERM Southern Africa (Pty) Ltd, their client and is subject to all confidentiality, copyright, trade secrets, and intellectual property law and practices of SOUTH AFRICA.

1. Introduction

ERM Southern Africa (Pty) Ltd appointed EnviroSci (Pty) Ltd to conduct an aquatic assessment of the proposed Mulilo Amsterdam Wind Energy Facility cluster between Ermelo and Amsterdam in the Mpumalanga Province. This report is focused on assessing the Sheepmoor Wind Energy Facility and its associated Overhead Line alternatives (Figure 1).

This assessment includes delineating any natural waterbodies, as well as assessing the potential consequences of the proposed project – The study area) on the surrounding wetlands and or watercourses. This was based on information collected during various site visits conducted within the region from March 2022 and a site-specific assessment in April & September 2023. Substantiated by the National Wetland Inventory v5.2 spatial data (NWI). Additional site visits were conducted in February 2025, while working in the region to confirm any changes since the initial surveys.

These surveys adhered to the assessment criteria contained in the DWAF 2005 / 2008 delineation manuals and the National Wetland Classification System. This report will inform the Environmental Authorisation process, as well as the required Water Use License Application that will be initiated, once the final project layout is available, i.e. once all the constraints, if any from this and other specialists have been considered in the design process.

The PROTOCOL FOR SPECIALIST ASSESSMENT AND MINIMUM REPORT CONTENT REQUIREMENTS FOR THE ENVIRONMENTAL IMPACTS ON AQUATIC BIODIVERSITY (Government Gazette 43110, 20 March 2020), superseding the Appendix 6 NEMA requirements, was also adhered to as results of the DFFE Screening tool indicated that portions of the study area are located within a VERY HIGH SENSITIVITY area, requiring this assessment. This is due to following being highlighted by the DFFE Screening Tool Results for the WEF study area and OHL assessment corridors:

- Very High CBA: Aquatic rivers
- Very High CBA: Wetlands
- Very High ESA: Important sub catchments
- Very High ESA: Strategic Water Source Area (SWSA)
- Very High ESA: Wetland clusters
- Very High ESA: Wetlands
- Very High FEPA Subcatchment
- Very High Rivers_AB
- Very High Rivers_B
- Very High Rivers_C
- Very High SWSA (Surface Water) _Upper Usutu
- Very High SWSA (Surface Water) _Upper Vaal
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Seep)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Valley-bottom)
- Very High Wetlands_Mesic (Riverine)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Depression)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Floodplain)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Seep)

Several important national, provincial and municipal scale conservation plans were also reviewed, with the results of those studies being included in this report. Most conservation plans are produced at a high level, so it is therefore important to verify the actual status of the study area during this initial phase, prior to the final layout plan being produced.

1.1 Aims and objectives

The aim of this report is to firstly provide a summary of the aquatic baseline and identify any No-Go areas. The report also makes recommendations with regard to further management and mitigation, to further reduce, avoid or mitigate the potential impacts and ultimately ensure the responsible and sustainable use of South

Africa's aquatic resources. The proposed layout was then assessed with regard the potential impacts and mitigations later in this report.

Certain aspects of the development could trigger the need for Section 21, Water Use License Applications (WULAs) (or general authorisation [GA] applications) such as river crossings or any activities within 500m of a wetland. Once the final layout receives Environmental Authorisation, these applications must then be submitted to the Department of Water and Sanitation (DWS).

Information regarding the state and function of the observed water bodies, including suitable no-go buffers areas is thus also provided. Information with regard to the state and function of the observed water bodies, suitable no-go buffers and assessment of the potential impacts are also provided, but it is the intent that where possible sensitive areas such as the wetlands will be avoided or spanned (OHL).

1.2 Assumptions and Limitation

To obtain a comprehensive understanding of the dynamics of both the flora and fauna of the aquatic communities within a study site, as well as the status of endemic, rare or threatened species in any area, assessments should always consider investigations at different time scales (across seasons/years) and through replication. No baseline long-term monitoring was undertaken as part of this assessment. However, a concerted effort was made to assess as much of the potential site, as well as make use of any available literature, species distribution data and aerial photography. Furthermore, based on the previous assessments undertaken between 2003 and 2023 in the area and this was not foreseen as a huge limiting factor. Detailed site visits conducted within the region from March 2022 and a site-specific assessment in April & September 2023 were also conducted. The level of investigation undertaken is sufficient to inform this assessment. Additional site visits were conducted in February 2025, while working in the region to confirm any changes since the initial surveys.

It should be emphasised that information, as presented in this document, only has reference to the study area as indicated on the accompanying maps. Therefore, this information cannot be applied to any other area without detailed investigation.

For the purposes of this report, it is assumed that any existing roads and tracks will be used, while structures will be placed outside the wetlands and or watercourses. A further assumption is that water will be sourced from a licensed resource and not illegally abstracted from any surrounding watercourses, particularly if dust suppression is required for example at the laydown areas or along main / district roads.

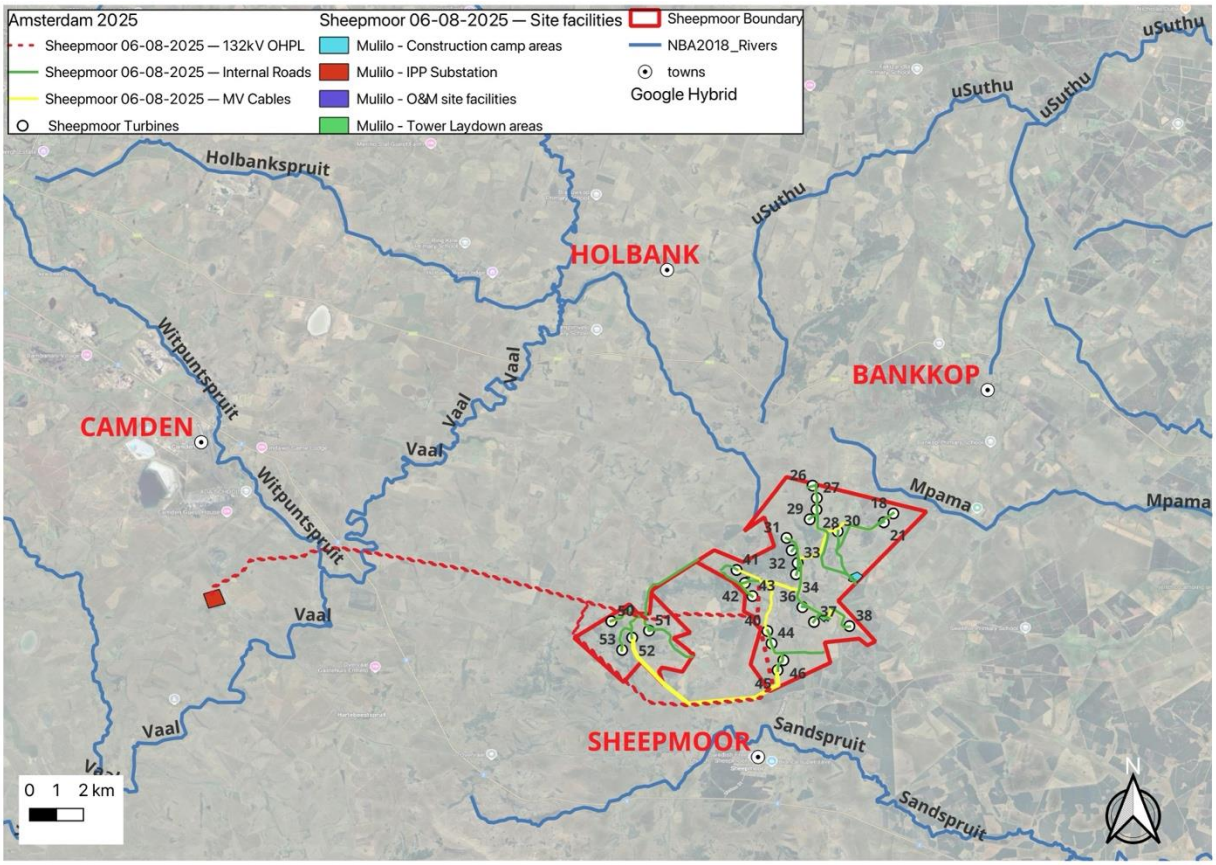

Figure 1: The proposed Wind Energy Facility (WEF) site boundaries, possible infrastructure layout (excluding hardstand and crane pads) and the potential OHL alignment alternatives

2. Terms of Reference

The proposed methods used in this assessment have been developed with the renewable industry in mind, coupled to the minimum requirements stipulated by DFFE and the Department of Water and Sanitation. These have been successful in assessing the direct, indirect and cumulative impacts of ca 200 renewable energy projects (2010 – 2025), of which 28 have been constructed:

- Desktop analysis
- Site investigation
- Compilation of one draft and one final site screening / sensitivity report for the project which adheres to the following (this list is not exhaustive):
    - The Initial Site Sensitivity Verification reporting requirements for environmental themes set out in Government Gazette No. 43110 which was promulgated on 20 March 2020 in terms of section 24(5)(a) and (h) of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA).
    - Identification and mapping of any discrepancies with the environmental sensitivity as identified on the national web based environmental screening tool.
    - Identification of sensitive areas to be avoided (including corresponding spatial data) and the determination of the respective buffers (if applicable) for each site.
    - Initial recommendations for the layout and allowable development footprint from a surface water and aquatic biodiversity perspective (including corresponding spatial data).
    - Recommendations regarding the areas to be utilised for solar technologies within the project site from a surface water and aquatic biodiversity perspective (including corresponding spatial data)
- Assess the potential impacts, based on a supplied methodology, including cumulative impacts and for pre-construction, construction, operations and decommissioning phases.

- Provide mitigations regarding project related impacts, including engineering services that could negatively affect demarcated wetland areas.
- Supply the client with geo-referenced GIS shape files of the wetland / riverine areas.
- Provide one draft report for comment, with a maximum of two rounds of comments addressed per project phase (max of 2).

3. Project Description

The following information was provided by the client:

Sheepmoor WEF is proposed to comprise up to 45 turbines with a maximum output capacity of up to 360 MW. The WEF will be located on seventeen (17) land parcels and will have an anticipated lifespan of 20 – 25 years. The final design which will be requested for approval in the EA, will be determined based on the outcome of the specialist studies undertaken for the EIA phase of the development. The proposed turbine footprints and associated facility infrastructure will cover an area of up to 180 ha after rehabilitation, depending on final layout design.

It is proposed that an on-site substation with a capacity up 132 kV and an up to 132 kV Overhead Powerline (OHPL) of approximately 22.3 km (300 m corridor) in distance, traversing sixteen (16) land parcels, be constructed to connect the proposed WEF to the Eskom Uitkoms Substation.

4. Methodology

This study followed the approaches of several national guidelines with regards to wetland assessment. These have been modified by the author, to provide a relevant mechanism of assessing the present state of the study systems, applicable to the specific environment and in a clear and objective manner, assess the potential impacts associated with the proposed development site based on information collected within the relevant farm portions of a number of years for this and other proposed projects.

Current water resource classification systems make use of the Hydrogeomorphic (HGM) approach, and for this reason, the National Wetland Classification System (NWCS) approach will be used in this study. It is also important to understand wetland definition, means of assessing wetland conservation and importance as well as understanding the pertinent legislation with regards to protecting wetlands. These aspects will be discussed in greater depth in this section of the report, as they form the basis of the study approach to assessing wetland impacts.

4.1 Waterbody classification systems

Since the late 1960's, wetland classification systems have undergone a series of international and national revisions. These revisions allowed for the inclusion of additional wetland types, ecological and conservation rating metrics, together with a need for a system that would allude to the functional requirements of any given wetland (Ewart-Smith *et al*., 2006). Wetland function is a consequence of biotic and abiotic factors, and wetland

classification should strive to capture these aspects. Coupled to this was the inclusion of other criteria within the classification systems to differentiate between river, riparian and wetland systems, as well as natural versus artificial waterbodies.

The South African National Biodiversity Institute (SANBI) in collaboration with several specialists and stakeholders developed the newly revised and now accepted National Wetland Classification Systems (NWCS) (Ollis *et al*., 2013). This system comprises a hierarchical classification process of defining a wetland based on the principles of the hydrogeomorphic (HGM) approach at higher levels, with including structural features at the finer or lower levels of classification (Ollis *et al*., 2013).

Wetlands develop in a response to elevated water tables, linked either to rivers, groundwater flows or seepage from aquifers (Parsons, 2004). These water levels or flows then interact with localised geology and soil forms, which then determines the form and function of the respective wetlands. Water is thus the common driving force, in the formation of wetlands (DWAF, 2005). It is significant that the HGM approach has now been included in the wetland classifications as the HGM approach has been adopted throughout the water resources management realm with regards to the determination of the Present Ecological State (PES) and Ecological Importance and Sensitivity (EIS) and WET-Health assessments for aquatic environments. All these systems are then easily integrated using the HGM approach in line with the Eco-classification process of river and wetland reserve determinations used by the Department of Human Settlement, Water and Sanitation (DHSWS). The Ecological Reserve of a wetland or river is used by DHSWS to assess the water resource allocations when assessing WULAs.

The National Wetland Classification System process is provided in more detail in the methods section of the report, but some of the terms and definitions used in this document are presented below:

Definition Box

Present Ecological State is a term for the current ecological condition of the resource. This is assessed relative to the deviation from the Reference State. Reference State/Condition is the natural or pre-impacted condition of the system. The reference state is not a static condition but refers to the natural dynamics (range and rates of change or flux) prior to development. The PES is determined per component - for rivers and wetlands this would be for the drivers: flow, water quality and geomorphology; and the biotic response indicators: fish, macroinvertebrates, riparian vegetation and diatoms. PES categories for every component would be integrated into an overall PES for the river reach or wetland being investigated. This integrated PES is called the EcoStatus of the reach or wetland.

EcoStatus is the overall PES or current state of the resource. It represents the totality of the features and characteristics of a river and its riparian areas or wetland that bear upon its ability to support an appropriate natural flora and fauna and its capacity to provide a variety of goods and services. The EcoStatus value is an integrated ecological state made up of a combination of various PES findings from component EcoStatus assessments (such as for invertebrates, fish, riparian vegetation, geomorphology, hydrology and water quality).

Reserve: The quantity and quality of water needed to sustain basic *human needs* and *ecosystems* (e.g. estuaries, rivers, lakes, groundwater and wetlands) to ensure ecologically sustainable development and utilisation of a water resource. The *Ecological Reserve* pertains specifically to aquatic ecosystems.

Reserve requirements: The quality, quantity and reliability of water needed to satisfy the requirements of basic human needs and the Ecological Reserve (inclusive of instream requirements).

Ecological Reserve determination study: The study undertaken to determine Ecological Reserve requirements.

Licensing applications: Water users are required (by legislation) to apply for licenses prior to extracting water resources from a water catchment.

Ecological Water Requirements: This is the quality and quantity of water flowing through a natural stream course that is needed to sustain instream functions and ecosystem integrity at an acceptable level as determined during an EWR study. These then form part of the conditions for managing achievable water quantity and quality conditions as stipulated in the Reserve Template

Water allocation process (compulsory licensing): This is a process where all existing and new water users are requested to reapply for their licenses, particularly in stressed catchments where there is an over-allocation of water or an inequitable distribution of entitlements.

Ecoregions are geographic regions that have been delineated in a top-down manner on the basis of physical/abiotic factors. • NOTE: For purposes of the classification system, the 'Level I Ecoregions' for South Africa, Lesotho and Swaziland (Kleynhans *et al.* 2005), which have been specifically developed by the Department of Water Affairs & Forestry (DWAF) for rivers but are used for the management of inland aquatic ecosystems more generally, are applied at Level 2A of the classification system. These Ecoregions are based on physiography, climate, geology, soils and potential natural vegetation.

4.2 Wetland definition

Although the National Wetland Classification System (NWCS) (Ollis *et al*., 2013) is used to classify wetland types, it is still necessary to understand the definition of a wetland. Terminology currently strives to characterise a wetland not only on its structure (visible form), but also to relate this to the function and value of any given wetland.

The Ramsar Convention definition of a wetland is widely accepted as "areas of marsh, fen, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed six metres" (Davis 1994). South Africa is a signatory to the Ramsar Convention and therefore its extremely broad definition of wetlands has been adopted for the proposed NWCS, with a few modifications.

Whereas the Ramsar Convention included marine water to a depth of six metres, the definition used for the NWCS extends to a depth of ten metres at low tide, as this is recognised as the seaward boundary of the shallow photic zone (Lombard et al., 2005). An additional minor adaptation of the definition is the removal of the term

'fen' as fens are considered a type of peatland. The adapted definition for the NWCS is, therefore, as follows (Ollis *et al*., 2013):

WETLAND: an area of marsh, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed ten metres.

This definition encompasses all ecosystems characterised by the permanent or periodic presence of water other than marine waters deeper than ten metres. The only legislated definition of wetlands in South Africa, however, is contained within the National Water Act (Act No. 36 of 1998) (NWA), where wetlands are defined as "land which is transitional between terrestrial and aquatic systems, where the water table is usually at, or near the surface, or the land is periodically covered with shallow water and which land in normal circumstances supports, or would support, vegetation adapted to life in saturated soil." This definition is consistent with more precise working definitions of wetlands and therefore includes only a subset of ecosystems encapsulated in the Ramsar definition. It should be noted that the NWA definition is not concerned with marine systems and clearly distinguishes wetlands from estuaries, classifying the latter as a watercourse (Ollis *et al*., 2013). Table 1 below provides a comparison of the various wetlands included within the main sources of wetland definitions used in South Africa.

Although a subset of Ramsar-defined wetlands was used as a starting point for the compilation of the first version of the National Wetland Inventory (i.e. "wetlands", as defined by the NWA, together with open waterbodies), it is understood that subsequent versions of the Inventory include the full suite of Ramsar-defined wetlands in order to ensure that South Africa meets its wetland inventory obligations as a signatory to the Convention (Ollis *et al.*, 2013).

Wetlands must therefore have one or more of the following attributes to meet the above definition (DWAF, 2005):

- A high-water table that results in the saturation at or near the surface, leading to anaerobic conditions developing in the top 50 cm of the soil.
- Wetland or hydromorphic soils that display characteristics resulting from prolonged saturation, i.e. mottling or grey soils
- The presence of, at least occasionally, hydrophilic plants, i.e. hydrophytes (water loving plants).

It should be noted that riparian systems that are not permanently or periodically inundated are not considered true wetlands, i.e. those associated with the drainage lines and rivers.

Table 1: Comparison of ecosystems considered to be 'wetlands' as defined by the proposed NWCS, the NWA and ecosystems included in DWAF's (2005) delineation manual.

Ecosystem	NWCS "wetland"	National Water Act wetland	DWAF (2005) delineation manual
Marine	YES	NO	NO
Estuarine	YES	NO	NO
Waterbodies deeper than 2 m (i.e. limnetic habitats often described as lakes or dams)	YES	NO	NO
Rivers, channels and canals	YES	NO[1]	NO
Inland aquatic ecosystems that are not river channels and are less than 2 m deep	YES	YES	YES
Riparian[2] areas that are permanently / periodically inundated or saturated with water within 50 cm of the surface	YES	YES	YES[3]
Riparian [3] areas that are not permanently / periodically inundated or saturated with water within 50 cm of the surface	NO	NO	YES[3]

[1] Although river channels and canals would generally not be regarded as wetlands in terms of the National Water Act, they are included as a 'watercourse' in terms of the Act

[2] According to the National Water Act and Ramsar, riparian areas are those areas that are saturated or flooded for prolonged periods and would be considered riparian wetlands, as opposed to non –wetland riparian areas that are only periodically inundated and the riparian vegetation persists due to having deep root systems drawing on water many meters below the surface.

[3] The delineation of 'riparian areas' (including both wetland and non-wetland components) is treated separately to the delineation of wetlands in DWAF's (2005) delineation manual.

4.3 National Wetland Classification System method

During this study, due to the nature of the wetlands and watercourses observed, it was determined that the newly accepted NWCS be adopted. This classification approach has integrated aspects of the HGM approach used in the WET-Health system as well as the widely accepted eco-classification approach used for rivers.

The NWCS (Ollis *et al*., 2013) as stated previously, uses hydrological and geomorphological traits to distinguish the primary wetland units, i.e. direct factors that influence wetland function. Other wetland assessment techniques, such as the DWAF (2005) delineation method, only infer wetland function based on abiotic and biotic descriptors (size, soils & vegetation) stemming from the Cowardin approach (Ollis *et al.,* 2013).

The classification system used in this study is thus based on Ollis *et al*. (2013) and is summarised below:

The NWCS has a six-tiered hierarchical structure, with four spatially nested primary levels of classification (Figure 2). The hierarchical system firstly distinguishes between Marine, Estuarine and Inland ecosystems (Level 1), based on the degree of connectivity the particular system has with the open ocean (greater than 10 m in depth). Level 2 then categorises the regional wetland setting using a combination of biophysical attributes at the landscape level, which operate at a broad bioregional scale.

This is opposed to specific attributes such as soils and vegetation. Level 2 has adopted the following systems:

- Inshore bioregions (marine)
- Biogeographic zones (estuaries)
- Ecoregions (Inland)

Level 3 of the NWCS assess the topographical position of inland wetlands as this factor broadly defines certain hydrological characteristics of the inland systems. Four landscape units based on topographical position are used in distinguishing between Inland systems at this level. No subsystems are recognised for Marine systems, but estuaries are grouped according to their periodicity of connection with the marine environment, as this would affect the biotic characteristics of the estuary.

Level 4 classifies the hydrogeomorphic (HGM) units discussed earlier. The HGM units are defined as follows:

- Landform – shape and localised setting of wetland
- Hydrological characteristics – nature of water movement into, through and out of the wetland
- Hydrodynamics – the direction and strength of flow through the wetland

These factors characterise the geomorphological processes within the wetland, such as erosion and deposition, as well as the biogeochemical processes.

Level 5 of the assessment pertains to the classification of the tidal regime within the marine and estuarine environments, while the hydrological and inundation depth classes are determined for inland wetlands. Classes are based on frequency and depth of inundation, which are used to determine the functional unit of the wetlands and are considered secondary discriminators within the NWCS.

Level 6 uses six descriptors to characterise the wetland types based on biophysical features. As with Level 5, these are non-hierarchal in relation to each other and are applied in any order, dependent on the availability of information. The descriptors include:

- Geology;
- Natural vs. Artificial;
- Vegetation cover type;
- Substratum;
- Salinity; and
- Acidity or Alkalinity.

It should be noted that where sub-categories exist within the above descriptors, hierarchical systems are employed, and these are thus nested in relation to each other.

The HGM unit (Level 4) is the focal point of the NWCS, with the upper levels (Figure 3 – Inland systems only) providing means to classify the broad bio-geographical context for grouping functional wetland units at the HGM level, while the lower levels provide more descriptive detail on the particular wetland type characteristics of a particular HGM unit. Therefore Level 1 – 5 deals with functional aspects, while Level 6 classifies wetlands on structural aspects.

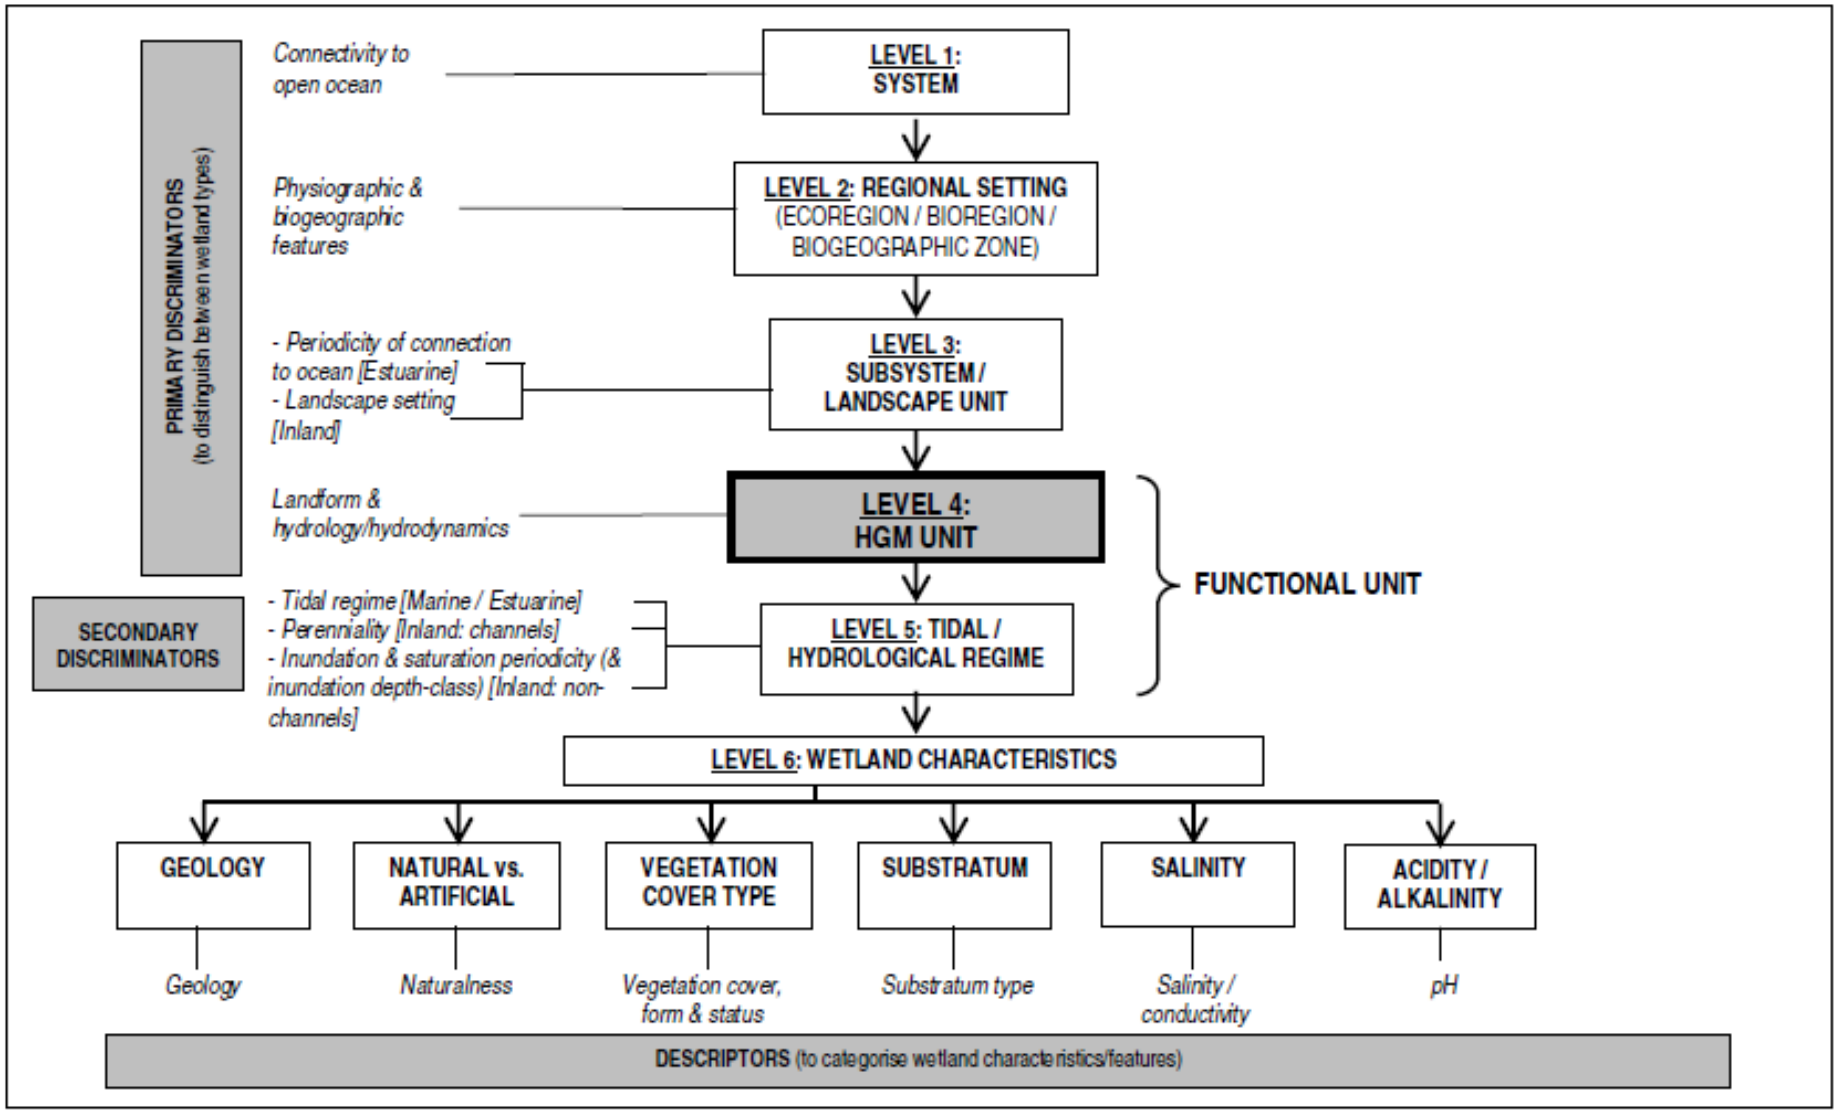

Figure 2: Basic structure of the NWCS, showing how 'primary discriminators' are applied up to Level 4 to classify Hydrogeomorphic (HGM) Units, with 'secondary discriminators' applied at Level 5 to classify the tidal/hydrological regime, and 'descriptors' applied at Level 6 to categorise the characteristics of wetlands classified up to Level 5 (From Ollis *et al*., 2013).

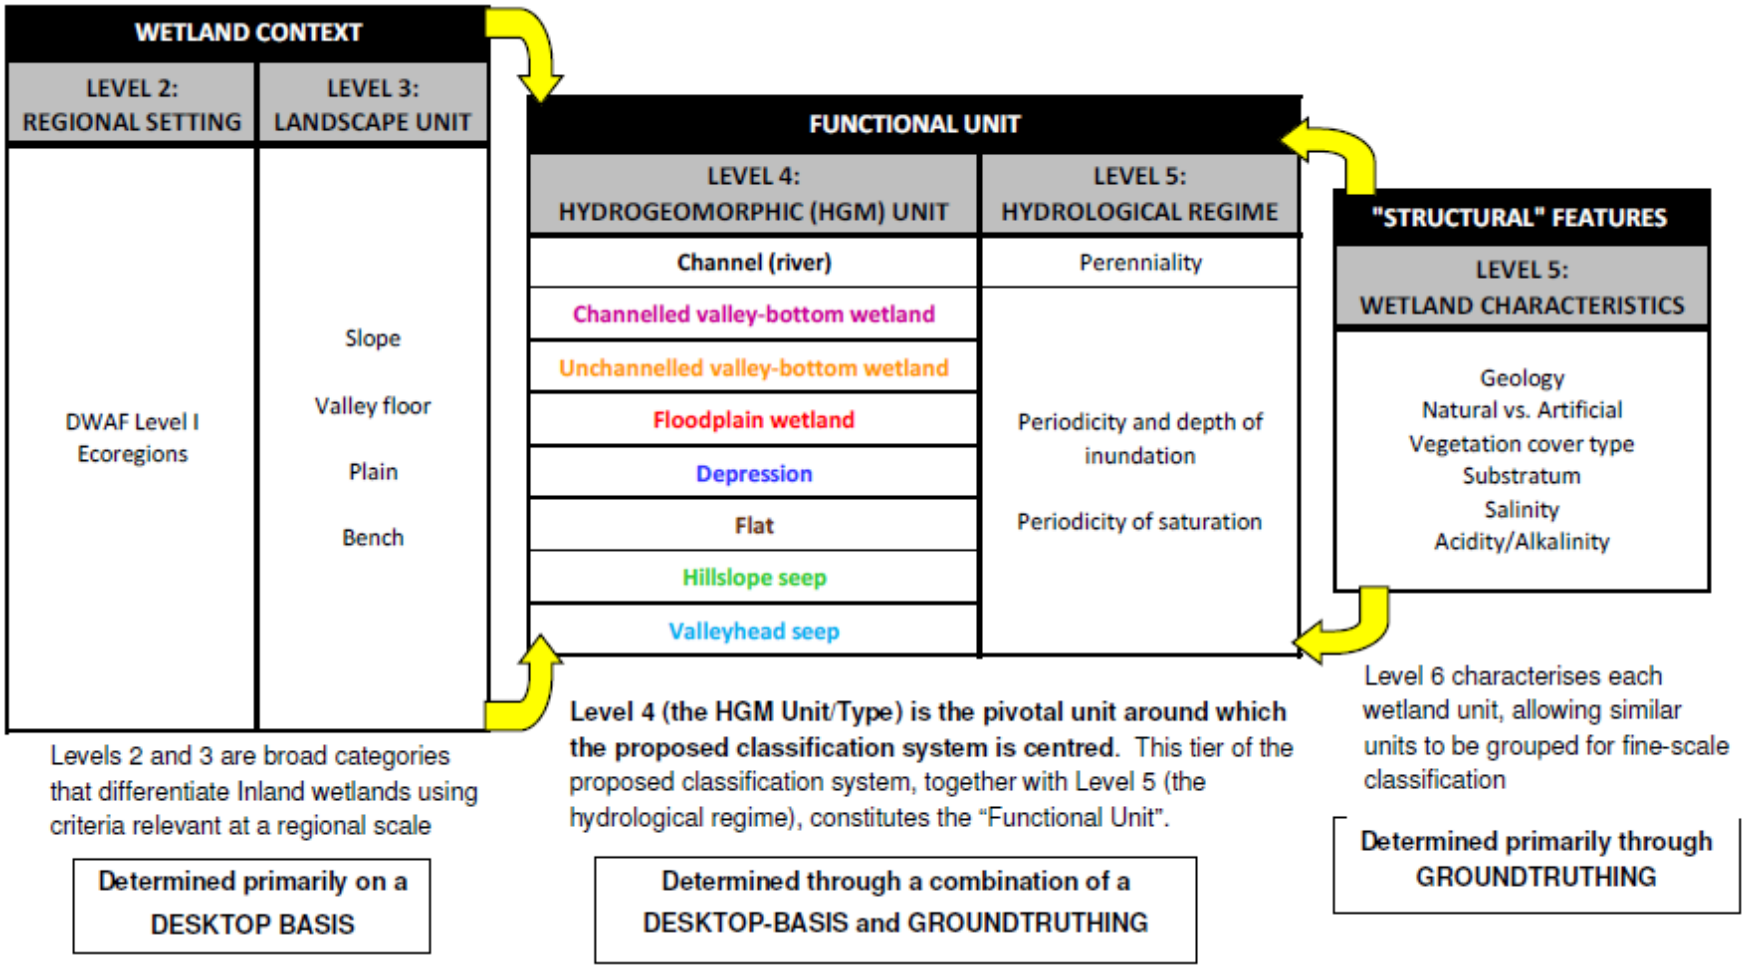

Figure 3: Illustration of the conceptual relationship of HGM Units (at Level 4) with higher and lower levels (relative sizes of the boxes show the increasing spatial resolution and level of detail from the higher to the lower levels) for Inland Systems (from Ollis *et al*., 2013).

4.4 Waterbody condition

To assess the PES or condition of the observed wetlands, a modified Wetland Index of Habitat Integrity (DWAF, 2007) was used. The Wetland Index of Habitat Integrity (WETLAND-IHI) is a tool developed for use in the National Aquatic Ecosystem Health Monitoring Programme (NAEHMP), formerly known as the River Health Programme (RHP). The output scores from the WETLAND-IHI model are presented in the standard DWAF A-F ecological categories (Table 2) and provide a score of the PES of the habitat integrity of the wetland system being examined. The author has included additional criteria into the model-based system to include additional wetland types. This system is preferred when compared to systems such as WET-Health – wetland management series (WRC 2009), as WET-Health (Level 1) was developed with wetland rehabilitation in mind and is not always suitable for impact assessments. This coupled with the degraded state of the wetlands in the study area, indicated that a complex study approach was not warranted, i.e. conduct a Wet-Health Level 2 and WET-Ecosystems Services study required for an impact assessment.

Table 2: Description of A – F ecological categories based on Kleynhans *et al*., (2005)

ECOLOGICAL CATEGORY	ECOLOGICAL DESCRIPTION	MANAGEMENT PERSPECTIVE
A	Unmodified, natural.	Protected systems; relatively untouched by human hands; no discharges or impoundments allowed
B	Largely natural with few modifications. A small change in natural habitats and biota may have taken place but the ecosystem functions are essentially unchanged.	Some human-related disturbance, but mostly of low impact potential
C	Moderately modified. Loss and change of natural habitat and biota have occurred, but the basic ecosystem functions are still predominantly unchanged.	Multiple disturbances associated with need for socio-economic development, e.g. impoundment, habitat modification and water quality degradation
D	Largely modified. A large loss of natural habitat, biota and basic ecosystem functions has occurred.	
E	Seriously modified. The loss of natural habitat, biota and basic ecosystem functions is extensive.	Often characterized by high human densities or extensive resource exploitation. Management intervention is needed to improve health, e.g. to restore flow patterns, river habitats or water quality
F	Critically / Extremely modified. Modifications have reached a critical level and the system has been modified completely with an almost complete loss of natural habitat and biota. In the worst instances the basic ecosystem functions have been destroyed and the changes are irreversible.	

The WETLAND-IHI model is composed of four modules. The "Hydrology", "Geomorphology" and "Water Quality" modules all assess the contemporary driving processes behind wetland formation and maintenance. The last module, "Vegetation Alteration", provides an indication of the intensity of human land use activities on the wetland surface itself and how these may have modified the condition of the wetland. The integration of the scores from these 4 modules provides an overall PES score for the wetland system being examined. The WETLAND-IHI model is an MS Excel-based model, and the data required for the assessment are generated during a site visit.

Additional data may be obtained from remotely sensed imagery (aerial photos; maps and/or satellite imagery) to assist with the assessment. The interface of the WETLAND-IHI has been developed in a format which is similar to DWA's River EcoStatus models which are currently used for the assessment of PES in riverine environments.

4.5 Aquatic ecosystem importance and function

South Africa is a Contracting Party to the Ramsar Convention on Wetlands, signed in Ramsar, Iran, in 1971, and has thus committed itself to this intergovernmental treaty, which provides the framework for the national protection of wetlands and the resources they could provide. Wetland conservation is now driven by the South African National Biodiversity Institute, a requirement under the National Environmental Management: Biodiversity Act (No 10 of 2004).

Wetlands are among the most valuable and productive ecosystems on earth, providing important opportunities for sustainable development (Davies and Day, 1998). However, wetlands in South Africa are still rapidly being lost or degraded through direct human induced pressures (Nel *et al.,* 2004).

The most common attributes or goods and services provided by wetlands include:

- Improve water quality;
- Impede flow and reduce the occurrence of floods;
- Reeds and sedges used in construction and traditional crafts;
- Bulbs and tubers, a source of food and natural medicine;
- Store water and maintain base flow of rivers;
- Trap sediments; and
- Reduce the number of water-borne diseases.

In terms of this study, the wetlands provide ecological (environmental) value to the area acting as refugia for various wetland associated plants, butterflies and birds.

In the past wetland conservation has focused on biodiversity as a means of substantiating the protection of wetland habitat. However not all wetlands provide such motivation for their protection, thus wetland managers and conservationists began assessing the importance of wetland function within an ecosystem.

Table 3 below summarises the importance of wetland function when related to ecosystem services or ecoservices (Kotze *et al*., 2008). One such example is emergent reed bed wetlands that function as transformers converting inorganic nutrients into organic compounds (Mitsch and Gosselink, 2000).

Table 3: Summary of direct and indirect ecoservices provided by wetlands from Kotze *et al*., 2008

Ecosystem services supplied by wetlands	Indirect benefits	Hydro-geochemical benefits		Flood attenuation
				Stream flow regulation
			Water quality enhancement benefits	Sediment trapping
				Phosphate assimilation
				Nitrate assimilation
				Toxicant assimilation
				Erosion control
				Carbon storage
				Biodiversity maintenance
	Direct benefits			*Provision of water for human use*
				Provision of harvestable resources[2]
				Provision of cultivated foods
				Cultural significance
				Tourism and recreation
				Education and research

Conservation importance of the individual wetlands was based on the following criteria:

- Habitat uniqueness;
- Species of conservation concern;
- Habitat fragmentation or rather, continuity or intactness with regards to ecological corridors; and
- Ecosystem service (social and ecological).

The presence of any or a combination of the above criteria would result in a HIGH conservation rating if the wetland was found in a near natural state (high PES). Should any of the habitats be found modified the conservation importance would rate as MEDIUM, unless a Species of Conservation Concern (SCC) was observed, in which case it would receive a HIGH rating. Any system that was highly modified (low PES) or had none of the above criteria, received a LOW conservation importance rating. Wetlands with HIGH and MEDIUM ratings should thus be excluded from development with incorporation into a suitable open space system, with the maximum possible buffer being applied. Natural wetlands or Wetlands that resemble some form of the past landscape but receive a LOW conservation importance rating could be included into stormwater management features and should not be developed to retain the function of any ecological corridors.

4.6 Relevant wetland legislation and policy

Locally the South African Constitution, seven (7) Acts and two (2) international treaties allow for the protection of wetlands and rivers. These systems are protected from destruction or pollution by the following:

- Section 24 of The Constitution of the Republic of South Africa, 1996;
- Agenda 21 – Action plan for sustainable development of the Department of Environmental Affairs and Tourism (DEAT) 1998;
- The Ramsar Convention, 1971 including the Wetland Conservation Programme (DEAT) and the National Wetland Rehabilitation Initiative (DEAT, 2000);
- National Environmental Management Act (NEMA), 1998 (Act No. 107 of 1998) inclusive of all amendments, as well as the NEM: Biodiversity Act;
- National Water Act, 1998 (Act No. 36 of 1998);
- Conservation of Agricultural Resources Act, 1983 (Act No. 43 of 1983); and
- Minerals and Petroleum Resources Development Act, 2002 (Act No. 28 of 2002).
- Nature and Environmental Conservation Ordinance, 1974 (No. 19 of 1974)
- National Forest Act, 1998 (No. 84 of 1998)
- National Heritage Resources Act, 1999 (No. 25 of 1999)

NEMA and the Conservation of Agricultural Resources Act (CARA), 1983 (Act No. 43 of 1983) would also apply to this project. These Acts have categorised many invasive plants together with associated obligations on the landowner.

4.7 Provincial legislation and policy

Currently riverine and wetland buffers distances are calculated using the model described by Macfarlane *&* Bredin (2017). Site specific information was collected during the visit and is used to determine site and development specific range of buffers. In short, the buffer distances are based on the current condition of the waterbody, the state of the remainder of the site, the potential impacts posed by the type and scale of the of development, as wells as the proposed alteration of hydrological flows. The model also takes cognisance of the level of mitigation possible, coupled to the reversibility of the impacts. Based then on the information known for the site the buffer model provided the following:

Channelled Valley Bottom Wetlands	65m
Pans and Depressions	105m
Rivers and Floodplains	95m
Seeps	65m
Minor watercourses	35m

Artificial dams were not buffered.

5. Description of the affected environment

This baseline description was based on a summer and winter survey of the study area that spanned a total of two weeks and conducted in February / March 2022 (late summer) and a site-specific assessment in April (Autumn) & September (Later winter) 2023. Additional site visits were conducted in February 2025, while working in the region to confirm any changes since the initial surveys.

The study area was dominated by a variety of aquatic features associated with catchments and rivers, characterised as follows:

- Mainstem Rivers: Floodplain dominated systems with floodplain wetlands (Plate 1). A few reaches did contain very narrow riparian zones, consisting mostly of a single row of willow trees associated with the Vaal River
- Valley Bottom Wetlands (Channelled and Unchanneled) (Plate 2)
- Endorheic pans (Plate 3)
- Seep wetlands (Plate 4)

The proposed Wind Energy Facility (WEF) is located in a portion of the Inkomati-Usuthu Water Management Area, within the upper catchment of the Mpama River (SQ W53) and the Sandspruit (SQ W53A) and the proposed grid connection options are located in the Upper Vaal River (SQ C11B) in the Vaal Water Management Area (Figure 4). Thus, several permanent rivers and a variety of wetland hydrogeomorphic types are anticipated both associated with the riverine valleys and bench or plateaux areas located between river valleys on higher lying areas (Figure 5).

The study region is further characterised by several National Biodiversity Assessment (2018) Wetland Clusters, National Freshwater Ecosystem Area (NFEPAs) and Strategic Water Resources Areas (Figure 6)

The geology is mostly shales or sandstone of the Vryhied Group, with several intrusions associated with dolerite sills and dykes in areas associated with the Karoo Supergroup. This typically allows for the development of riverine areas, some with floodplains, interspersed by the rocky inselbergs and small ridges and or bench / plateaus observed.

Overall, these catchment and subsequent rivers / watercourses and wetlands range from a Largely Natural to transformed states. Current impacts occur in localised areas and included the following:

- Mining
- Large scale farming
- Forestry
- Erosion due small road crossings and tracks;
- Grazing; and
- Small to large river impoundments, and off channel farm dams.

In terms of the National Freshwater Ecosystems Priority Areas (NFEPA) assessment, all the watercourses within the site have been assigned a condition score of C (Nel et al. 2011), indicating that they are Moderately Modified, but still have biological significance, while the NBA (2018). These scores were substantiated by observations made in the field within the study area, and due to the impacts or disturbance observed these scores would be upheld.

Any ratings will the also be substantiated with an assessment of the study area catchments linked to Critical Biodiversity Areas (CBA) and Ecological Support Areas, as shown in the Mpumalanga CBA spatial data.

The National Freshwater Ecosystems Priority Areas (NFEPA) (Nel *et al*., 2011), also earmarked sub-quaternaries, based either on the presence of important biota (e.g. rare or endemic fish species) or conversely the degree of riverine degradation, i.e. the greater the catchment degradation the lower the priority to conserve the catchment. The important catchments areas are then classified as Freshwater Ecosystems Priority Areas (FEPAs). The study area falls within several FEPA and Upstream FEPA catchments associated with the Usuthu & Vaal river

systems. This is large due to the presence of several important fish and aquatic invertebrate habitats that as well as the provision and maintenance of flows within the lower catchments.

Notably the following fish are commonly found in the study areas systems (Freshwater Biodiversity Information System - FBIS):

Fish Taxon	Conservation status
Enteromius anoplus (Weber, 1897)	Least concern
Enteromius pallidus (Smith, 1841)	Least concern
Enteromius paludinosus (Peters, 1852)	Least concern
Pseudocrenilabrus philander (Weber, 1897)	Least concern

The FBIS site data from 44 sites (https://freshwaterbiodiversity.org/map/#search//taxon=&search=&siteId=&collector=&category=&yearFrom=&yearTo=&months=&boundary=&userBoundary=&) spanning the study area also indicated a total of 200 aquatic invertebrate species, none currently listed as conservation needy as well as the following aquatic plants that were confirmed in this assessment

Plant Taxon	Conservation Status
Agrostis continuata Stapf	Not evaluated
Andropogon eucomus Nees	Least concern
Andropogon lacunosus J.G.Anderson	Least concern
Arundinella nepalensis Trin.	Not evaluated
Berula thunbergii (DC.) H.Wolff	Least concern
Brachiaria bovonei (Chiov.) Robyns	Least concern
Carex rhodesiaca Nelmes	Least concern
Chironia purpurascens (E.Mey.) Benth. & Hook.fil.	Least concern
Crinum bulbispermum (Burm.f.) Milne-Redh. & Schweick.	Least concern
Cyperus denudatus L.f.	Least concern
Cyperus macranthus Boeckeler	Not evaluated
Cyperus melanospermus (Nees) Valck.Sur.	Not evaluated
Cyperus nitidus Lam.	Not evaluated
Denekia capensis Thunb.	Not evaluated
Drosera collinsae N.E.Br. ex BurttDavy	Least concern
Echinochloa jubata Stapf	Least concern
Eleocharis dregeana Steud.	Least concern
Eleocharis limosa (Schrad.) Schult.	Least concern
Festuca caprina Nees	Not evaluated
Fimbristylis complanata (Retz.) Link	Least concern
Fuirena pubescens (Poir.) Kunth	Least concern
Geranium multisectum N.E.Br.	Least concern
Geranium wakkerstroomianum R.Knuth	Least concern
Gladiolus papilio Hook.f.	Not evaluated
Gunnera perpensa L.	Least concern
Hesperantha hygrophila Hilliard & B.L.Burtt	Least concern
Isolepis costata Hochst. ex A.Rich.	Not evaluated
Juncus effusus L.	Least concern
Juncus oxycarpus E.Mey. ex Kunth	Least concern
Lagarosiphon muscoides Harv.	Least concern
Leersia hexandra Sw.	Least concern

Limosella major Diels	Least concern
Miscanthus junceus (Stapf) Pilg.	Least concern
Nymphoides thunbergiana (Griseb.) Kuntze	Least concern
Odontelytrum abyssinicum Hack.	Least concern
Ornithogalum flexuosum (Thunb.) U.Müll.-Doblies & D.Müll.-Doblies	Not evaluated
Pennisetum macrourum Trin.	Least concern
Persicaria decipiens (R.Br.) K.L.Wilson	Least concern
Persicaria madagascariensis (Meisn.) S.Ortiz & Paiva	Not evaluated
Pterygodium nigrescens (Sond.) Schltr.	Least concern
Ranunculus multifidus Forssk.	Least concern
Rhynchospora brownii Roem. & Schult.	Least concern
Rorippa nudiuscula (E.Mey. ex Sond.) Thell.	Least concern
Sacciolepis typhura (Stapf) Stapf	Least concern
Schoenoplectus muriculatus (Kük.) Browning	Not evaluated
Schoenoplectus paludicola (Kunth) J.Raynal, 1976	Least concern
Typha capensis (Rohrb.) N.E.Br.	Not evaluated
Veronica anagallis-aquatica L.	Not evaluated
Xyris gerrardii N.E.Br.	Least concern

Plate 4: Seepage wetland in the headwater areas of the Vaal River / Usutu River catchment divide

6. Present Ecological State and conservation importance

The PES of a river represents the extent to which it has changed from the reference or near pristine condition (Category A) towards a highly impacted system where there has been an extensive loss of natural habit and biota, as well as ecosystem functioning (Category E).

The PES scores have been revised for the country and based on the current models, aspects of functional importance as well as direct and indirect impacts have been included (DWS, 2014). The current PES system also incorporates Ecological Importance (EI) and Ecological Sensitivity (ES) separately as opposed to Ecological Importance and Sensitivity (EIS) in the old model, although the new model is still heavily centred on rating rivers using broad fish, invertebrate, riparian vegetation and water quality indicators. The Recommended Ecological Category (REC) is still contained within the updated models, with the default REC being B, when little or no information is available to assess the system or when only one of the above-mentioned parameters are assessed or the overall PES is rated between a C or D.

The Present Ecological State scores (PES) for the main watercourses in the study area were rated as follows (DWS, 2014 – where B = Largely Natural and C = Moderately Modified):

Subquaternary Catchment Number	Present Ecological State	Ecological Importance	Ecological Sensitivity
1630	B	Moderate	High
1710	B	Moderate	High
1678	C	High	Moderate
1693	C	High	High
1770	C	High	High

These scores were substantiated by observations made in the field within the study area, and due to the overall lack of impacts or disturbance these scores for each of the watercourses within the site should be upheld.

This was further substantiated by the inclusion of study area catchments into Critical Biodiversity Areas (Type 1 and 2), i.e. the wetland areas near the alignment crossing the Brak River in particular and Ecological Support Area as shown in the Mpumalanga CBA MAP spatial data and Wetland Clusters (Figure 8).

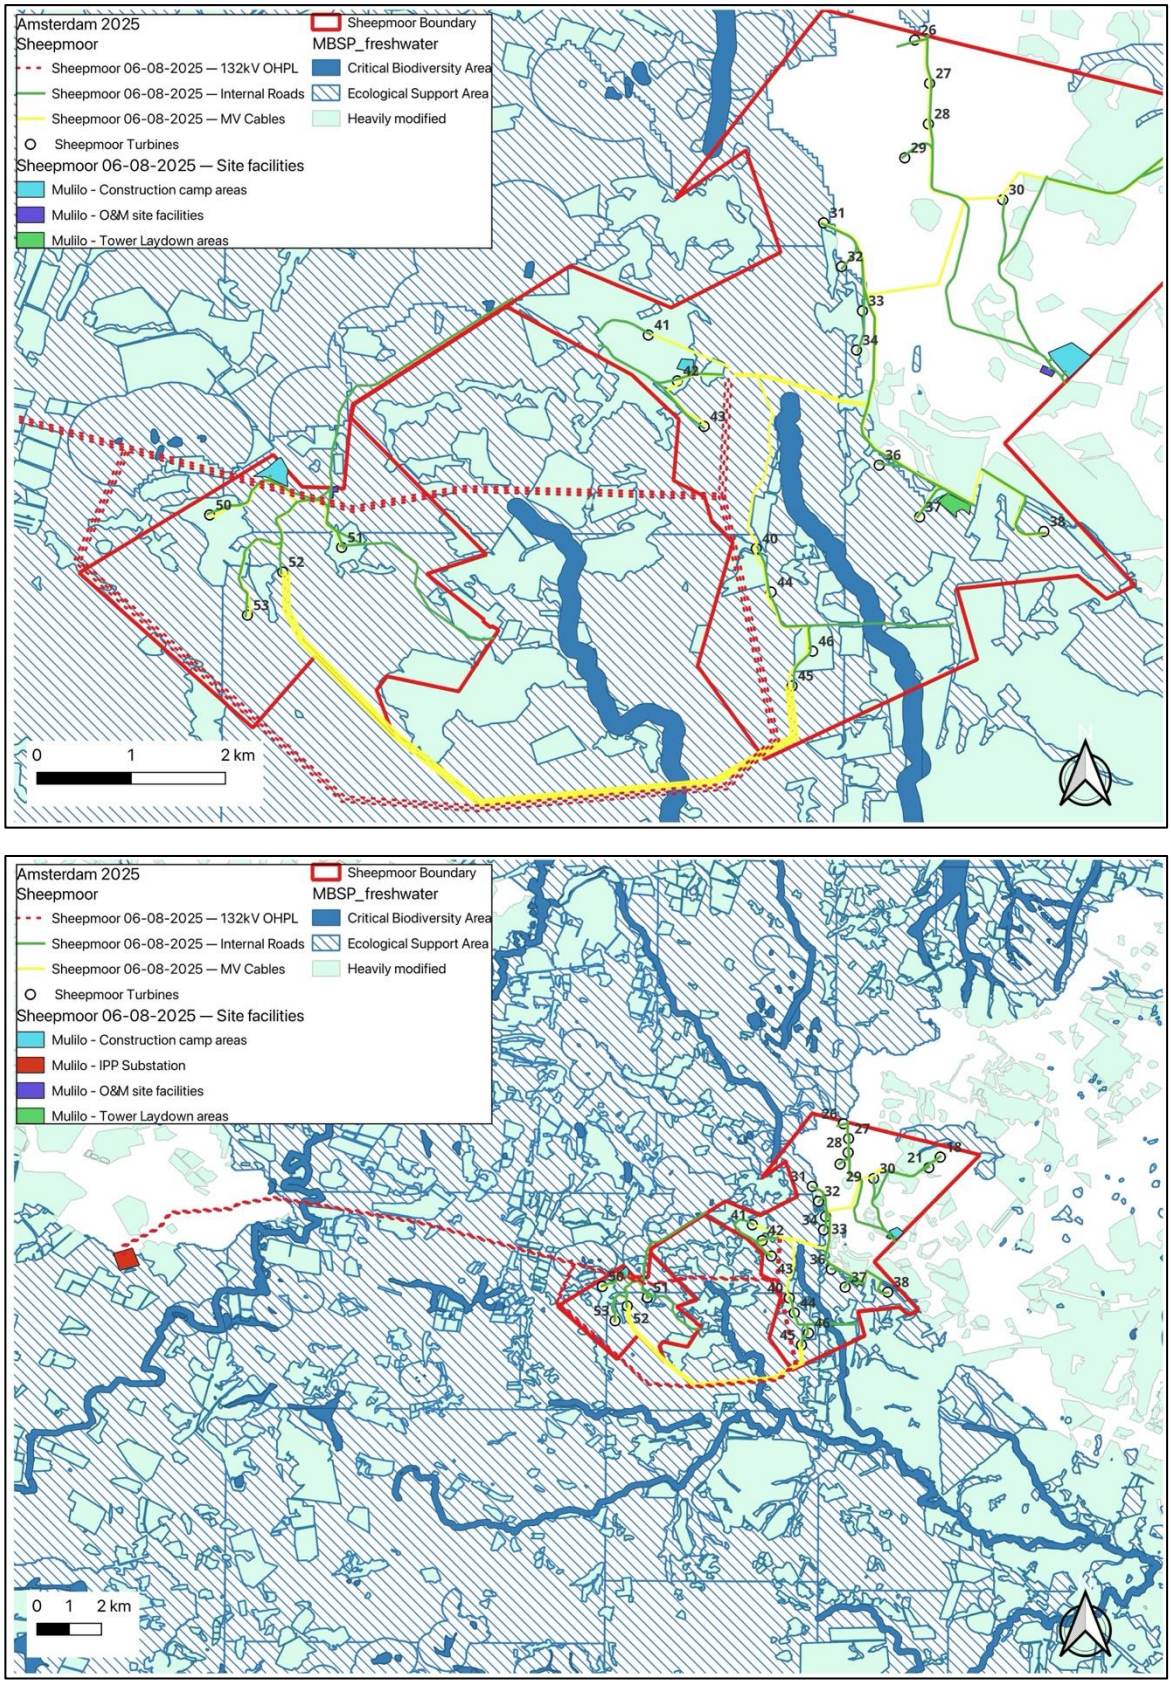

Figure 8: Critical Biodiversity Areas as per the Mpumalanga Biodiversity Spatial Plan, where the top map is for the project area and the bottom map is for the WEF

7. Permit requirements

Based on an assessment of the proposed activities and past engagement with DWS, the following WULs/ GA's could be required based on the following thresholds as listed in the following Government Notices, however ultimately the Department Water and Sanitation (DWS) will determine if a GA or full WULA will be required during the pre-application process (Phase 1):

	Water Use Activity	Applicable to this development proposal
S21(a)	Taking water from a water resource	Only water if water is abstracted from a local river or borehole
S21(b)	Storing water	If the total volume stored is greater than 40 000 m^3 then a full Water Use License will be required. This is however unlikely due to the scale of the project and the need for such large volumes.
S21(c)	Impeding or diverting the flow of water in a watercourse	Yes – several new crossings of watercourses (i.e. activities within 500m of a wetland or 100m of a watercourse will be required. A GA process can potentially be followed if Risk Assessment Matrix indicates all impacts are LOW.
S21(d)	Engaging in a stream flow reduction activity	Not applicable
S21(e)	Engaging in a controlled activity	Not applicable
S21(f)	Discharging waste or water containing waste into a water resource through a pipe, canal, sewer or other conduit	Not applicable
S21(g)	Disposing of waste in a manner which may detrimentally impact on a water resource	Not applicable – Only portable toilets will be required
S21(h)	Disposing in any manner of water which contains waste from, or which has been heated in, any industrial or power generation process	Not applicable
S21(i)	Altering the bed, banks, course or characteristics of a watercourse	Yes – several new crossings of watercourses (i.e. activities within 500m of a wetland or 100m of a watercourse will be required. A GA process can potentially be followed if Risk Assessment Matrix indicates all impacts are LOW.
S21(j)	Removing, discharging or disposing of water found underground for the continuation of an activity or for the safety of persons	Not applicable
S21(k)	Using water for recreational purposes	Not applicable

8. Sensitivity Assessment

Using the baseline description and field data while considering the current disturbances and site characteristics, the following features were identified, then categorised into one of number pre-determined sensitivity categories to provide protect and/or guide the layout planning:

High = No Go	"No go" areas or setbacks and areas or features that are considered of such significance that impacting them may be regarded as fatal flaw or strongly influence the project impact significance profile Therefore areas or features that are considered to have a high sensitivity or where project infrastructure would be highly constrained and should be avoided as far as possible. Infrastructure located in these areas are likely to drive up impact significance ratings and mitigations
Medium	Buffer areas and or areas that are deemed to be of medium sensitivity but should still be avoid as this would minimise impacts and or the need for additional Water Use Authorisation
Low	Areas of low sensitivity or constraints, such as artificial systems with little to no biological value or would not result in any future licensing requirements e.g. dry earth wall farm dams
Neutral	Unconstrained areas (left blank in mapping)

Table 4 below provides an overview of the sensitivity of various aquatic features (with buffers distances included) as it relates to the main project component types for the project. The features are shown spatially in Figure 7 above.

The sensitivity ratings of High No-go and Low were determined through an assessment of the aquatic habitat sensitivity and related constraints. However, these No-Go areas (with buffers) relate in general terms to the project and there are areas where encroachment on these areas would occur (i.e. existing road crossings within systems, but this is considered acceptable since these areas have already been impacted.

These proposed constraints / buffers do not include bird and or bat specialist buffers / constraints as theirs buffers along aquatic features are at times far larger around aquatic features, than those required for the known aquatic species within this region.

Table 4: Results of the sensitivity rating / constraints assessment

Development Component	Habitat type	Sensitivity rating of the respective habitat type against the development type	Buffer distance (m)	Development acceptability	Sensitivity rating override if an impact such as a road or other disturbance already occurs within the proposed footprint and confirmed by the specialist
WTG towers	Channelled Valley Bottom Wetlands	No-Go	105m	No WTGs should be placed in any of these areas, regardless of the state, type and functionality of the respective aquatic ecosystem	None
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		
Hardstands, Buildings / Substations & BESS	Channelled Valley Bottom Wetlands	No-Go	105m	None of these types of infrastructure should be placed in any of these areas	None
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		
Roads & Underground cables alignment roads	Channelled Valley Bottom Wetlands	High	105m	New roads and underground cables would not be deem appropriate within any of these areas, unless some form of disturbance already occurs, such as an existing track or bridge	Only existing tracks or disturbed areas maybe used
	Pans and Depressions		95m		
	Rivers and Floodplains				
	Seeps		65m		
	Minor watercourses		35m		
OHL	Channelled Valley Bottom Wetlands	High	105m	OHL towers must be placed outside of these area so that only the cables span these systems. The exception being that Pans & Depression inclusive of buffers must be avoided completely	
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		

9. Impact assessment

During the impact assessment several potential key issues / impacts were identified and these were assessed based on the methodology supplied by ERM.

9.1 Alternatives Assessment

The 2014 EIA Regulations require that any feasible and reasonable activity, location and technology alternatives considered must be described and comparatively assessed.

9.2 No-Go Option

With regard the No-Go option it is assumed that the site would continue to degrade due to the prevalence of grazing and or erosion within the water courses. This would continue into the long-term with a Low intensity that would impact on the regional scale due to loss of important habitat. Little in the way of mitigation could be proposed due to the social needs of the surrounding residents and or landowners, coupled to the need for access.

10. Potential aquatic ecosystems impacts

- Impact 1: Loss of habitat containing protected species or Species of Special Concern
- Impact 2: Loss of any critical corridors, important catchment areas and connected habitats that are linked to any Critical Biodiversity Areas or Ecological Support Areas
- Impact 3: The potential spread of alien vegetation
- Impact 4: Loss of riparian and or wetland habitat
- Impact 5: Changes to the hydrological regime and increased potential for erosion
- Impact 6: Changes to water quality
- Impact 7: Cumulative Impacts

The Tables 5 – 11 below assesses the impact significance for each impact. It was determined that the impacts upon aquatic biodiversity associated with the project are of Low significance, after mitigation. This assumes that the mitigations listed below are considered coupled to the fact that the overall layouts have avoid any of the High / No-Go areas, unless making use of areas with impacts such as existing farm roads. However, it is assumed that the final layout will orientate the hardstands, crane pads, blade laydowns camps outside any of the No-Go areas.

The loss of irreplaceable aquatic habitat and/or important aquatic obligate biota is therefore highly unlikely. The impacts are easily mitigated (provided the mitigation measures and monitoring plan within the EMP and this report are implemented and adhered to during all future phases of the project).

Table 5: Impact assessment summary for Impact 1 – Loss of habitat containing protected species or Species of Special Concern

Impact Phase: Construction and Decommissioning					
Nature of the impact: Loss of vegetation and in particular species / habitats that could contain listed as Critically Endangered and or Vulnerable species (direct)					
Description of Impact: Activities resulting in physical disturbance of aquatic systems which provide ecosystem services, especially where new crossings are made, or large hard engineered surfaces are placed within the buffer zones. Loss can also include a functional loss, through change in vegetation type via alien encroachment, reducing aquatic biodiversity. However no aquatic vegetation with conservation concern were observed during this assessment, coupled to the fact that any sensitive areas will be avoided.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3
With Mitigation	Site	Short Term	Recoverable	Low	Low Probability
Score	1	2	3	1	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Moderate Negative Impact (39)			Low Negative Impact (14)	
Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					
Mitigation measures to reduce residual risk or enhance opportunities: • The development of the stormwater management plan and Aquatic Rehabilitation and Monitoring plan, coupled to confirmation of the final layout prior to construction is made by the aquatic specialist. • Where large cut and fill areas are required, these must be stabilised and rehabilitated during the construction process, to minimise erosion and sedimentation. • Suitable stormwater management systems must be installed along roads and other areas and monitored during the first few months of use. Any erosion / sedimentation must be resolved through whatever additional interventions maybe necessary (i.e., extension, energy dissipaters, spreaders, etc). To minimise the impact of the access roads: • Use existing roads or upgrade existing tracks rather than constructing entirely new roads wherever possible and has been included in the proposed layout.					

- Use the smallest possible working corridor. Outside the working corridor, all watercourses are to be considered no go areas. Where intrusion is required, the working corridor must be kept to a minimum and demarcated clearly before any construction commences.
- Removal of vegetation must only be when essential for the continuation of the project. Do not allow any disturbance to the adjoining natural vegetation cover or soils.
- Where required, all pipe culverts must be removed and replaced with suitable sized box culverts, where road levels are raised. Crossings that are installed below the natural ground level are to be constructed with an appropriate drop inlet structure on the upstream side to ensure that head cut erosion does not develop because of the gradient change from the natural ground level to the invert level of the culvert.
- The channel profile, regardless of the current state of the river / water course, will be reinstated thus preventing any impoundments from being formed. The related designs must be assessed by an aquatic specialist, with a preference for low level drifts where possible.
- Water diversions must be temporary in nature and no permanent walls, berms or dams may be installed within a watercourse. Sandbags used in any diversion or for any other activity within a watercourse must be in a good condition, so that they do not burst and empty sediment into the watercourse. Upon completion of the construction at the site, the diversions shall be removed to restore natural flow patterns. Under no circumstance shall a new channel or drainage canals be excavated to divert water away from construction activities.
- Any fauna (frogs, snakes, etc.) that are found within the construction area must be moved to the closest point of similar habitat type outside of the areas to be impacted.
- All disturbed areas beyond the construction site that are intentionally or accidentally disturbed during the construction phase must be rehabilitated.

It is the contractor's responsibility to continuously monitor the area for newly established alien species during the contract and establishment period, which if present must be removed. Removal of these species shall be undertaken in a way which prevents any damage to the remaining indigenous species and inhibits the re-infestation of the cleaned areas.

Table 6: Impact assessment summary for Impact 2 – Loss of CBAs or potential areas with conservation potential or linked to any important catchments and strategic water resource areas

Impact Phase: Construction and Decommissioning					
Nature of the impact: Loss of any critical corridors and connect habitats that are linked to any future conservation plans (direct) is not expected as these can been avoided, coupled to the fact that hydrological connections will be retained through avoidance or the inclusion of ecological buffers.					
Description of Impact: Activities resulting in physical disturbance of aquatic systems which provide ecosystem services, especially where new crossings are made, or large hard engineered surfaces are placed within the buffer zones and have been included in any Critical Biodiversity Areas. it is assumed that the final layout will orientate the hardstands, crane pads, blade laydowns and construction camps outside of any of the No-Go areas.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3
With Mitigation	Site	Short Term	Recoverable	Low	Low Probability
Score	1	2	3	1	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Moderate Negative Impact (39)			Low Negative Impact (14)	
Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					
Mitigation measures to reduce residual risk or enhance opportunities: • The aquatic systems have been mapped to a finer scale and have taken cognizance of any potential CBAs. As High / No-Go have been avoided by the major infrastructure such as turbines, the aquatic zones associated within the CBA / ESAs have also been avoided. Roads will need to traverse these areas, thus it is important to try and select existing areas with impacts / crossings where possible, coupled to the assumptions above • The development of the stormwater management plan and Aquatic Rehabilitation and Monitoring plan, coupled to confirmation of the final layout prior to construction is made by the aquatic specialist. • Where large cut and fill areas are required, these must be stabilised and rehabilitated during the construction process, to minimise erosion and sedimentation. • Suitable stormwater management systems must be installed along roads and other areas and monitored during the first few months of use. Any erosion / sedimentation must be resolved through whatever additional interventions maybe necessary (i.e., extension, energy dissipaters, spreaders, etc). To minimise the impact of the access roads: • Use existing roads or upgrade existing tracks rather than constructing entirely new roads wherever possible and has been included in the proposed layout. • Use the smallest possible working corridor. Outside the working corridor, all watercourses are to be considered no go areas. Where intrusion is required, the working corridor must be kept to a minimum and demarcated clearly, before any construction commences.					

• Removal of vegetation must only be when essential for the continuation of the project. Do not allow any disturbance to the adjoining natural vegetation cover or soils. • Where required, all pipe culverts must be removed and replaced with suitable sized box culverts, where road levels are raised. Crossings that are installed below the natural ground level are to be constructed with an appropriate drop inlet structure on the upstream side to ensure that head cut erosion does not develop as a result of the gradient change from the natural ground level to the invert level of the culvert. • The channel profile, regardless of the current state of the river / water course, will be reinstated thus preventing any impoundments from being formed. The related designs must be assessed by an aquatic specialist, with a preference for low level drifts where possible. • Water diversions must be temporary in nature and no permanent walls, berms or dams may be installed within a watercourse. Sandbags used in any diversion or for any other activity within a watercourse must be in a good condition, so that they do not burst and empty sediment into the watercourse. Upon completion of the construction at the site, the diversions shall be removed to restore natural flow patterns. Under no circumstance shall a new channel or drainage canals be excavated to divert water away from construction activities. • Any fauna (frogs, snakes, etc.) that are found within the construction area must be moved to the closest point of similar habitat type outside of the areas to be impacted. • All disturbed areas beyond the construction site that are intentionally or accidentally disturbed during the construction phase must be rehabilitated. It is the contractor's responsibility to continuously monitor the area for newly established alien species during the contract and establishment period, which if present must be removed. Removal of these species shall be undertaken in a way which prevents any damage to the remaining indigenous species and inhibits the re-infestation of the cleaned areas.	
Residual impact	Very low and acceptable with adoption of mitigation measures

Table 7: Impact assessment summary for Impact 3 – Potential spread of alien vegetation

Impact Phase: Construction and Operation					
Nature of the impact: Any physical disturbance could result in the spread of alien vegetation (direct)					
Description of Impact: During construction, complete clearing of the roads and turbine areas, as well any ancillary structures (offices and substations) will be required. This disturbance then allows for the alien species to colonise the soils, if left unmanaged.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3
With Mitigation	Site	Short Term	Recoverable	Low	Low Probability
Score	1	2	3	1	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Moderate Negative Impact (39)			Low Negative Impact (14)	
Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					

Mitigation measures to reduce residual risk or enhance opportunities: • Alien vegetation management must be initiated at the beginning of the construction period and must extend into any remaining areas into the operation phase on the facility • The revegetation of any temporary sites as well as any previously degraded areas must begin from the onset of the project, with the involvement of a botanist to assist with the revegetation specifications Regeneration of alien vegetation must be monitored once all areas have been cleared, forming part of a long-term alien vegetation management plan	
Residual impact	Very low and acceptable, with adoption of mitigation measures and monitoring

Table 8: Impact assessment summary for Impact 4 – Loss of riparian and or wetland habitat

Impact Phase: Construction and Decommissioning					
Nature of the impact: It was recommended that all wetlands / riverine systems as well as the inclusive of buffers, be avoided. it is assumed that the final layout will orientate the hardstands, crane pads, blade laydowns and construction camps outside of any of the No-Go areas.					
Description of Impact: During construction, complete clearing of the roads and turbine areas, as well any ancillary structures (offices and substations) will be required, which may impact the aquatic function or any corridors or connections between aquatic systems. However, all Very High Sensitivity / No-Go areas have been avoided by the proposed layout by also making use of existing road crossings or considering any of the proposed buffers.

Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					
Mitigation measures to reduce residual risk or enhance opportunities: • The development of the stormwater management plan and Aquatic Rehabilitation and Monitoring plan, coupled to confirmation of the final layout prior to construction is made by the aquatic specialist. • Where large cut and fill areas are required these must be stabilised and rehabilitated during the construction process, to minimise erosion and sedimentation. • Suitable stormwater management systems must be installed along roads and other areas and monitored during the first few months of use. Any erosion / sedimentation must be resolved through whatever additional interventions maybe necessary (i.e., extension, energy dissipaters, spreaders, etc). To minimise the impact of the access roads: • Use existing roads or upgrade existing tracks rather than constructing entirely new roads wherever possible and has been included in the proposed layout.					

• Use the smallest possible working corridor. Outside the working corridor, all watercourses are to be considered no go areas. Where intrusion is required, the working corridor must be kept to a minimum and demarcated clearly, before any construction commences. • Removal of vegetation must only be when essential for the continuation of the project. Do not allow any disturbance to the adjoining natural vegetation cover or soils. • Where required, all pipe culverts must be removed and replaced with suitable sized box culverts, where road levels are raised. Crossings that are installed below the natural ground level are to be constructed with an appropriate drop inlet structure on the upstream side to ensure that head cut erosion does not develop as a result of the gradient change from the natural ground level to the invert level of the culvert. • The channel profile, regardless of the current state of the river / water course, will be reinstated thus preventing any impoundments from being formed. The related designs must be assessed by an aquatic specialist, with a preference for low level drifts where possible. • Water diversions must be temporary in nature and no permanent walls, berms or dams may be installed within a watercourse. Sandbags used in any diversion or for any other activity within a watercourse must be in a good condition, so that they do not burst and empty sediment into the watercourse. Upon completion of the construction at the site, the diversions shall be removed to restore natural flow patterns. Under no circumstance shall a new channel or drainage canals be excavated to divert water away from construction activities. • Any fauna (frogs, snakes, etc.) that are found within the construction area must be moved to the closest point of similar habitat type outside of the areas to be impacted. • All disturbed areas beyond the construction site that are intentionally or accidentally disturbed during the construction phase must be rehabilitated. It is the contractor's responsibility to continuously monitor the area for newly established alien species during the contract and establishment period, which if present must be removed. Removal of these species shall be undertaken in a way which prevents any damage to the remaining indigenous species and inhibits the re-infestation of the cleaned areas.	
Residual impact	Very low and acceptable with adoption of mitigation measures

Table 9: Impact assessment summary for Impact 5 – Changes to the hydrological regime and increase potential for erosion

Impact Phase: Construction and Decommissioning					
Nature of the impact: Increased hard surfaces can result in increases in runoff generated by the site, thereby resulting in changes to localised hydrological regimes.					
Description of Impact: During construction, complete clearing of the roads and turbine areas, as well any ancillary structures (offices and substations) will be required, which may impact the aquatic function or any corridors or connections between aquatic systems. However, these areas must be by the proposed layout by also making use of existing road crossings or by considering any of the proposed buffers.

Table 10: Impact assessment summary for Impact 6 –Changes to surface water quality characteristics

Impact Phase: Construction and Decommissioning					
Nature of the impact: Potential impact on localised surface water quality (indirect)					
Description of Impact: During construction or decommissioning, earthworks will expose and mobilise earth materials, and a number of materials as well as chemicals will be imported and used on site and may end up in the surface water, including soaps, oils, grease and fuels, human wastes, cementitious wastes, paints and solvents, etc. Any spills during transport or while works area conducted in proximity to a watercourse has the potential to affect the surrounding biota. This can result in possible deterioration in aquatic ecosystem integrity and species diversity.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3
With Mitigation	Site	Short Term	Recoverable	Low	Low Probability
Score	1	2	3	1	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Moderate Negative Impact (39)			Low Negative Impact (14)	
Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					
Mitigation measures to reduce residual risk or enhance opportunities: • All liquid chemicals including fuels and oil, including for the BESS, must be stored in with secondary containment (bunds or containers or berms) that can contain a leak or spill. Such facilities must be inspected routinely and must have the suitable PPE and spill kits needed to contain likely worst-case scenario leak or spill in that facility, safely. • Washing and cleaning of equipment must be done in designated wash bays, where rinse water is contained in evaporation/sedimentation ponds (to capture oils, grease cement and sediment). • Mechanical plant and bowsers must not be refueled or serviced within 100m of a river channel or wetland. • All construction camps, lay down areas, wash bays, batching plants or areas and any stores should be beyond any demarcated water courses and their respective buffers. • Littering and contamination associated with construction activity must be avoided through effective construction camp management. • No stockpiling should take place within or near a water course. • All stockpiles must be protected and located in flat areas where run-off will be minimised and sediment recoverable.					

ECO monitors the site on a daily basis to ensure plant is in working order (minimise leaks), spills are prevented and if they do occur, are quickly rectified.	
Residual impact	Low risk and acceptable, with adoption of mitigation measures and monitoring

Table 11: Impact assessment summary for Impact 7 - Cumulative impact assessment for aquatic biodiversity

Cumulative Impact: Cumulative impacts on the aquatic resources of the area					
Description of Cumulative Impact: The cumulative impact assessment considers the combined impact of the remaining and other renewable projects within a 30km radius, that are also in the development phase and the associated grid lines on the aquatic resources. The rating below is based on the premise that important or sensitive features will be avoided by the various projects, while the mitigations proposed will ensure that the form and or function of downstream areas remain intact.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3
With Mitigation	Site	Short Term	Recoverable	Low	Low Probability
Score	1	2	3	1	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Moderate Negative Impact (39)			Low Negative Impact (14)	
Can Impacts be Enhanced?	No				
Enhancement: The project should share roads and infrastructure where possible to reduce the overall footprint and reduce stormwater and erosion and sedimentation related impacts The projects should collaborate with provincial roads authority to upgrade the main access routes and improve the crossings and stormwater controls					
Residual impact	Low				

11. Draft Specialists Recommendations for the EA

The DFFE Screening Tool identified two sensitivity ratings within the development footprint, namely, Low and Very High. There is overlap with the findings on site and the Screening Tool's outcome, thus the development footprint must be developed with cognisance of these sensitivities.

Therefore, environmental sensitivity input received from the aquatic ecology specialist was taken forward and considered within the EIA process and the impact to these areas assessed. Appropriate layout and development restrictions were implemented within the development footprint to ensure that the impact to aquatic ecology is deemed acceptable by the aquatic ecologist. However, it is assumed that the final layout will orientate the hardstands, crane pads, blade laydowns and construction camps outside of any of the No-Go areas.

The specialist has no objection to the authorisation of the proposed activities assuming that all mitigations and buffer zones are implemented.

Mitigation should focus on these areas and include measures to halt erosion and rehabilitate habitat in the sections affected by the construction. Without the implementation of mitigation measures, the project has potential to cause a Low cumulative impact upon aquatic biodiversity. However, with the adoption of mitigation, the proposed project will have a Very Low impact upon aquatic biodiversity.

12. Monitoring and Management Actions

The following are key recommendations, which are also critical to the proposed mitigations:

- Any of the activities, should also be monitored by the appointed Environmental Officer /Environmental Control Officer (EO/ECO) on a daily basis, especially during periods of river flow during construction.
- Any points of erosion should be stabilised immediately (sand bags in the short term) using gabions and reno mattress as required. No activities should take place outside of the demarcated servitude, to prevent additional cumulative impacts on these systems.
- The EMPr, must include a Construction Specific Monitoring and Rehabilitation Plan related to the water course and wetland crossings, and specifically to the prevention of erosion and sedimentation as these systems are prone to scour, with rehabilitation options being limited due to the sparse nature of the vegetation.
- Monitoring should occur on a monthly basis for 6 months post construction and where any unstable soils occur, these must be protected with temporary stabilisation dependent on the scale of the impact i.e. sand bags - hay bales) until areas become revegetated. If any areas require permanent erosion protection (e.g. gabions or stone pitching) then the WULA/GA must be amended to include these areas.

13.Conclusion and Recommendations

During this assessment, several sensitive aquatic habitats were observed and are shown in the maps provided in this report. Noteworthy areas, were then avoided by the required infrastructure, and include the main riverine and wetland systems, while the access roads will make use of existing roads thus previously disturbed areas as far as possible, especially near or when need to span aquatic systems.

If this is carried out, then the specialist has no objection to the authorisation of the proposed activities assuming that all mitigations and buffer zones are implemented.

Mitigation should focus on these areas and include measures to halt erosion and rehabilitate habitat in the sections affected by the construction. Without the implementation of mitigation measures, the project has potential to cause a Moderate cumulative impact upon aquatic biodiversity. However, with the adoption of mitigation, the proposed project will have a Low impact upon aquatic biodiversity.

As the proposed activities have the potential to create erosion the following recommendations are reiterated:

- Vegetation clearing should occur in a phased manner in accordance with the construction programme to minimise erosion and/or run-off. Large tracts of bare soil will either cause dust pollution or quickly erode and then cause sedimentation in the lower portions of the catchment, and suitable dust and erosion control mitigation measures should be included in the generic EMPr, if not included already to mitigate.

- All construction materials including fuels and oil should be stored in demarcated areas that are contained within berms / bunds to avoid spread of any contamination / leaks. Washing and cleaning of equipment should also be done in berms or bunds, to trap any cement / hazardous substances and prevent excessive soil erosion. Mechanical plant and bowsers must not be refuelled or serviced within or directly adjacent to

any channel. It is therefore suggested that all construction camps, lay down areas, batching plants or areas and any stores should be located more than 50 m from any demarcated watercourses.

- It is also advised that an Environmental Control Officer (ECO), with a good understanding of the local flora be appointed during the construction phase. The ECO should be able to make clear recommendations with regards to the re-vegetation of the newly completed / disturbed areas along aquatic features, using selected species detailed in this report.
- All alien plant re-growth must be monitored and should these alien plants reoccur these plants should be re-eradicated. The scale of the operation does however not warrant the use of a Landscape Architect and / or Landscape Contractor.

It is further recommended from the project onset that all watercourse areas (inclusive of buffers) are included into any existing EMPr as reference, this to ensure a net benefit to the aquatic environment. This should from part of the suggested walk down as part of the final EMP preparation.

CURRICULUM VITAE
Dr Brian Michael Colloty
[redacted]

1 Rossini Rd
Pari Park
Port Elizabeth, 6070
b.colloty@gmail.com
[redacted]

Profession: Ecologist & Environmental Assessment Practitioner (Pr. Sci. Nat. 400268/07)
Member of the South African Wetland Society
Specialisation: Ecology and conservation importance rating of terrestrial habitats, wetlands, rivers & estuaries
Years experience: 25 years

SKILLS BASE AND CORE COMPETENCIES

- 25 years experience in environmental sensitivity and conservation assessment of aquatic and terrestrial systems inclusive of Index of Habitat Integrity (IHI), WET Tools, Riparian Vegetation Response Assessment Index (VEGRAI) for Reserve Determinations, estuarine and wetland delineation throughout Africa. Experience also includes biodiversity and ecological assessments with regard sensitive fauna and flora, within the marine, coastal and inland environments. Countries include Mozambique, Kenya, Namibia, Central African Republic, Zambia, Eritrea, Mauritius, Madagascar, Angola, Ghana, Guinea-Bissau and Sierra Leone. Current projects also span all nine provinces in South Africa.
- 15 years experience in the coordination and management of multi-disciplinary teams, such as specialist teams for small to large scale EIAs and environmental monitoring programmes, throughout Africa and inclusive of marine, coastal and inland systems. This includes project and budget management, specialist team management, client and stakeholder engagement and project reporting.
- GIS mapping and sensitivity analysis

TERTIARY EDUCATION

- 1994: B Sc Degree (Botany & Zoology) - NMU
- 1995: B Sc Hon (Zoology) - NMU
- 1996: M Sc (Botany - Rivers) - NMU
- 2000: Ph D (Botany – Estuaries & Mangroves) – NMU

EMPLOYMENT HISTORY

- 1996 – 2000 Researcher at Nelson Mandela University – SAB institute for Coastal Research & Management. Funded by the WRC to develop estuarine importance rating methods for South African Estuaries
- 2001 – January 2003 Training development officer AVK SA (reason for leaving – sought work back in the environmental field rather than engineering sector)
- February 2003- June 2005 Project manager & Ecologist for Strategic Environmental Focus (Pretoria) – (reason for leaving – sought work related more to experience in the coastal environment)
- July 2005 – June 2009 Principal Environmental Consultant Coastal & Environmental Services (reason for leaving – company restructuring)
- June 2009 – August 2018 Owner / Ecologist of Scherman Colloty & Associates cc
- August 2018 Owner / Ecologist - EnviroSci (Pty) Ltd

SELECTED RELEVANT PROJECT EXPERIENCE

World Bank IFC Standards

- Kenmare Mining Pilivilli, Mozambique - wetland (mangroves, peatlands and estuarine) assessment and biodiversity offset analysis - current
- Botswana South Africa 400kv transmission line (400km) biodiversity assessment on behalf of Aurecon - current
- Farim phosphate mine and port development, Guinea Bissau – biodiversity and estuarine assessment on behalf of Knight Piesold Canada – 2016.
- Tema LNG offshore pipeline EIA – marine and estuarine assessment for Quantum Power (2015).
- Colluli Potash South Boulder, Eritrea, SEIA marine baseline and hydrodynamic surveys co-ordinator and coastal vegetation specialist (coastal lagoon and marine) (on-going).
- Wetland, estuarine and riverine assessment for Addax Biofeuls Sierra Leone, Makeni for Coastal & Environmental Services: 2009
- ESHIA Project manager and long-term marine monitoring phase coordinator with regards the dredge works required in Luanda bay, Angola. Monitoring included water quality and biological changes in the bay and at the offshore disposal outfall site, 2005-2011

South African

- Plant and animal search and rescue for the Karusa, Soetwater, Nxuba, Oyster Bay and Garob Wind Farms on behalf of Enel Green Power, 2018 - 2019
- Plant and Animal Search and Rescue for the Port of Ngqura, Transnet Landside infrastructure Project, with development and management of on site nursery (Current).
- Plant and Animal Search and Rescue for the Port of Ngqura, OTGC Tank Farm Project (2019)
- Plant search and rescue, for NMBM (Driftsands sewer, Glen Hurd Drive), Department of Social Development (Military veterans housing, Despatch) and Nxuba Wind Farm, - current
- Wetland specialist appointed to update the Eastern Cape Biodiversity Conservation Plan, for the Province on behalf of EOH CES appointment by SANBI – current. This includes updating the National Wetland Inventory for the province, submitting the new data to CSIR/SANBI.
- CDC IDZ Alien eradication plans for three renewable projects Coega Wind Farm, Sonop Wind Farm and Coega PV, on behalf of JG Afrika (2016 – 2017).
- Nelson Mandela Bay Municipality Baakens River Integrated Wetland Assessment (Inclusive of Rehabilitation and Monitoring Plans) for CEN IEM Unit - Current
- Rangers Biomass Gasification Project (Uitenhage), biodiversity and wetland assessment and wetland rehabilitation / monitoring plans for CEM IEM Unit – current.
- Gibson Bay Wind Farm implementation of the wetland management plan during the construction and operation of the wind farm (includes surface / groundwater as well wetland rehabilitation & monitoring plan) on behalf of Enel Green Power - current
- Gibson Bay Wind Farm 133kV Transmission Line wetland management plan during the construction of the transmission line (includes wetland rehabilitation & monitoring plan) on behalf of Eskom – 2016.
- Tsitsikamma Community Wind Farm implementation of the wetland management plan during the construction of the wind farm (includes surface / biomonitoring, as well wetland rehabilitation & monitoring plan) on behalf of Cennergi – completed May 2016.
- Alicedale bulk sewer pipeline for Cacadu District, wetland and water quality assessment, 2016
- Mogalakwena 33kv transmission line in the Limpopo Province, on behlaf of Aurecon, 2016
- Cape St Francis WWTW expansion wetland and passive treatment system for the Kouga Municipality, 2015
- Macindane bulk water and sewer pipelines wetland and wetland rehabilitation plan 2015
- Eskom Prieska to Copperton 132kV transmission line aquatic assessment, Northern Cape on behalf of Savannah Environmental 2015.
- Joe Slovo sewer pipeline upgrade wetland assessment for Nelson Mandela Bay Municipality 2014
- Cape Recife Waste Water Treatment Works expansion and pipeline aquatic assessment for Nelson Mandela Bay Municipality 2013
- Pola park bulk sewer line upgrade aquatic assessment for Nelson Mandela Bay Municipality 2013
- Transnet Freight Rail – Swazi Rail Link (Current) wetland and ecological assessment on behalf of Aurecon for the proposed rail upgrade from Ermelo to Richards Bay
- Eskom Transmission wetland and ecological assessment for the proposed transmission line between Pietermaritzburg and Richards Bay on behalf of Aurecon (2012).
- Port Durnford Exarro Sands biodiversity assessment for the proposed mineral sands mine on behalf of Exxaro (2009)
- Fairbreeze Mine Exxaro (Mtunzini) wetland assessment on behalf of Strategic Environmental Services (2007).
- Wetland assessment for Richards Bay Minerals (2013) – Zulti North haul road on behalf of RBM.
- Biodiversity and aquatic assessments for 101 renewable projects in the past 8 years in the Western, Eastern, Northern Cape, KwaZulu-Natal and Free State provinces. Clients included RES-SA, Red Cap, ACED Renewables, Mainstream Renewable, GDF Suez, Globeleq, ENEL, Abengoa amongst others. Particular aquatic sensitivity assessment and Water Use License Applications on behalf of Mainstream Renewable Energy (8 wind farms and 3 PV facilities.), Cennergi / Exxaro (2 Wind farms), WKN Wind current (2 wind farms & 2 PV facilities), ACED (6 wind farms) and Windlab (3 Wind farms) were also conducted. Several of these projects also required the assessment of the proposed transmission lines and switching stations, which were conducted on behalf of Eskom.
- Vegetation assessments on the Great Brak rivers for Department of Water and Sanitation, 2006 and the Gouritz Water Management Area (2014)
- Proposed FibreCo fibre optic cable vegetation assessment along the PE to George, George to Graaf Reinet, PE to Colesburg, and East London to Bloemfontein on behalf of SRK (2013-2015).

15.Appendix 2 - Site Sensitivity Verification Report

Site verification report – Aquatic Ecology

Government Notice No. 645, dated 10 May 2019, includes the requirement that an Initial Site Sensitivity Verification Report must be produced for a development footprint. As per Part 1, Section 2.3, the outcome of the Initial Site Verification must be recorded in the form of a report that-

(a) Confirms or disputes the current use of the land and environmental sensitivity as identified by the national web based environmental screening tool;
(b) Contains a motivation and evidence of either the verified or different use of the land and environmental sensitivity;
(c) Is submitted together with the relevant reports prepared in accordance with the requirements of the Environmental Impact Assessment Regulations.

This report has been produced specifically to consider the aquatic ecology theme and addresses the content requirements of (a) and (b) above. The report will be appended to the respective specialist study included in the Basic Assessment Report produced for the project.

Site sensitivity based on the aquatic biodiversity theme included in the Screening Tool and specialist assessment

Based on the DFFE Screening Tool, the WEF and Grid Connection falls within areas of very high sensitivity (Figure 1).

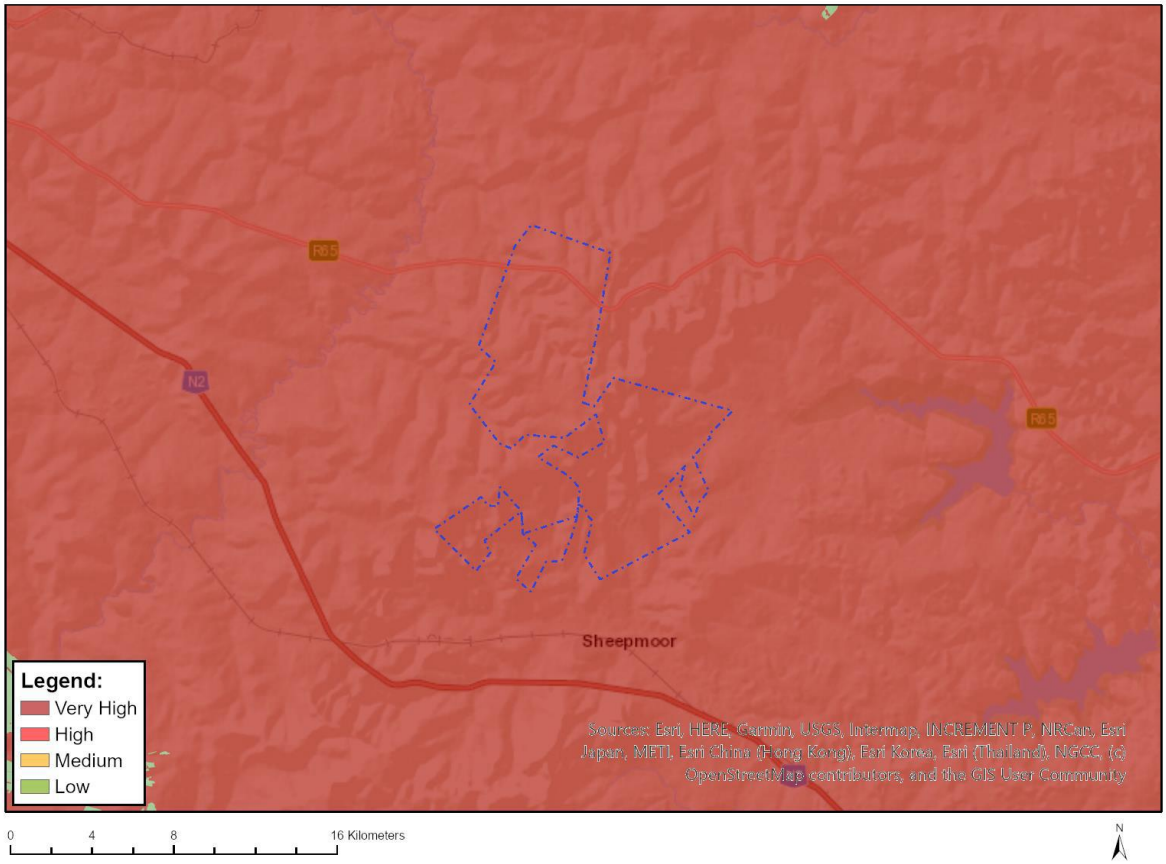

Figure 1a. DFFE Screening Tool outcome for the aquatic biodiversity theme for the WEF site

Figure 1b. DFFE Screening Tool outcome for the aquatic biodiversity theme for the Preferred Grid alignment

Based on the above outcomes, the specialist agrees the environmental sensitivities identified on site. However, disputes the exact extent of the systems, as the Screening Tool shows a catchment wide representation of the aquatic waterbodies that were rated as sensitive.

The specialist findings were informed by a site visits undertaken by Dr Brian Colloty over the course of several years. This information was then compared to current wetland inventories, 1: 50 000 topocadastral surveys mapping and the site. A baseline map was then developed which was refined, noting that due to the complex of the topography and geology, some of the river lines were digitised at a scale of 1:2000.

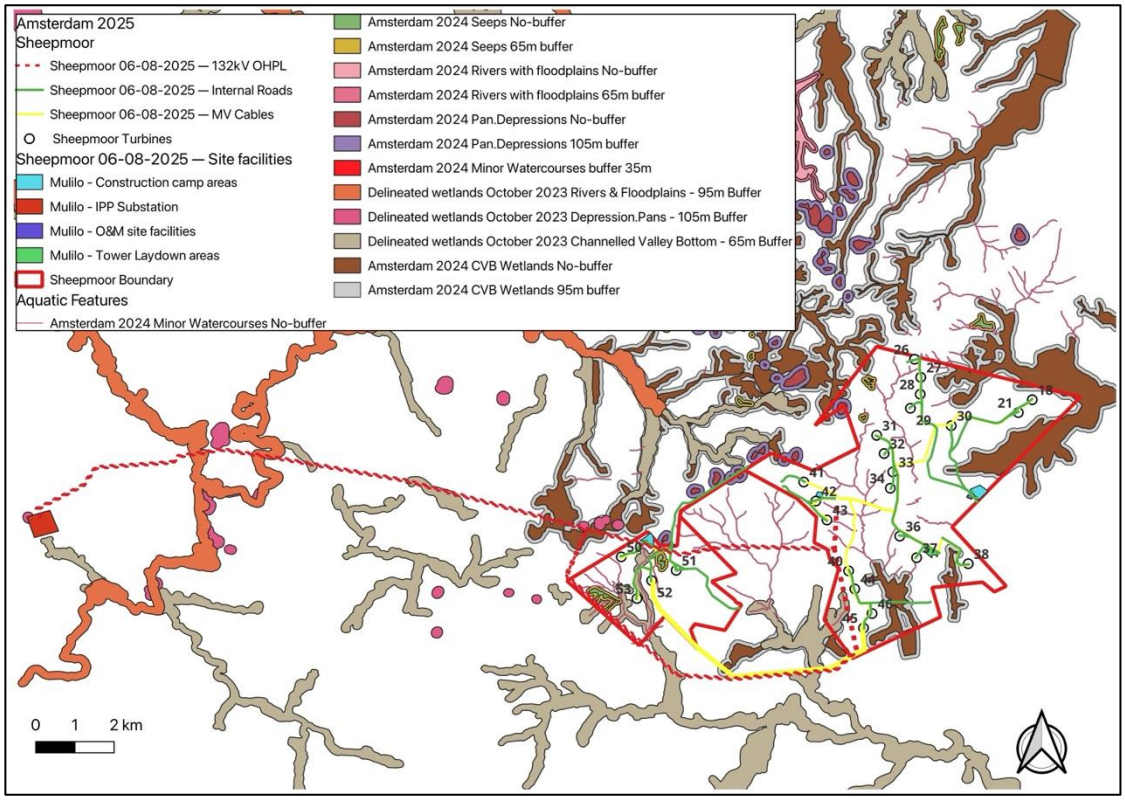

Figure 2. Environmental sensitivity map produced by the aquatic specialist

Motivation of the outcomes of the sensitivity map and key conclusions

In conclusion, the DFFE Screening Tool identified one sensitivity rating within the development footprint, namely, Very High.

Although there is some overlap with the findings on site and the Screening Tool's outcome, the development footprint contains various sensitivities (Very High and Low) that were identified following the undertaking of several site visits and spatial input considerations.

The environmental sensitivity input received from the aquatic ecology specialist wase taken forward and considered within the formal EA process and the impact to these areas assessed. Appropriate layout and development restrictions were implemented within the development footprint to ensure that the impact to aquatic ecology is deemed acceptable by the aquatic ecologist.

16. Appendix 3: Compliance with the Aquatic Biodiversity Protocol (GN 320, 20 March 2020)

Protocol for the Specialist Assessment and Minimum Report Content Requirements for Environmental Impacts on Aquatic Biodiversity	*Section where this has been addressed in the Specialist Report*
2.3. The assessment must provide a baseline description of the site which includes, as a minimum, the following aspects: *2.3.1. a description of the aquatic biodiversity and ecosystems on the site, including;* *a) aquatic ecosystem types; and* *b) presence of aquatic species, and composition of aquatic species communities, their habitat, distribution, and movement patterns;*	*Section 5 & 6 of this report*
2.3.2. the threat status of the ecosystem and species as identified by the screening tool;	*Section 5 & 6 of this report*
2.3.3. an indication of the national and provincial priority status of the aquatic ecosystem, including a description of the criteria for the given status (i.e., if the site includes a wetland or a river freshwater ecosystem priority area or sub catchment, a strategic water source area, a priority estuary, whether or not they are free -flowing rivers, wetland clusters, a critical biodiversity or ecologically sensitivity area); and	*Section 5 & 6 of this report*
2.3.4. a description of the ecological importance and sensitivity of the aquatic ecosystem including: *a) the description (spatially, if possible) of the ecosystem processes that operate in relation to the aquatic ecosystems on and immediately adjacent to the site (e.g., movement of surface and subsurface water, recharge, discharge, sediment transport, etc.); and* *b) the historic ecological condition (reference) as well as present ecological state of rivers (in- stream, riparian, and floodplain habitat), wetlands and/or estuaries in terms of possible changes to the channel and flow regime (surface and groundwater).*	*Section 5 & 6 of this report*
2.4. The assessment must identify alternative development footprints within the preferred site which would be of a "low" sensitivity as identified by the screening tool and verified through the site sensitivity verification and which were not considered appropriate.	*Section 9 of this report*
2.5. Related to impacts, a detailed assessment of the potential impacts of the proposed development on the following aspects must be undertaken to answer the following questions: *2.5.1. Is the proposed development consistent with maintaining the priority aquatic ecosystem in its current state and according to the stated goal?* *2.5.2. Is the proposed development consistent with maintaining the resource quality objectives for the aquatic ecosystems present?* *2.5.3. How will the proposed development impact on fixed and dynamic ecological processes that operate within or across the site? This must include:* *a) impacts on hydrological functioning at a landscape level and across the site which can arise from changes to flood regimes (e.g., suppression of floods, loss of flood attenuation*	*Section 9 of this report*

Protocol for the Specialist Assessment and Minimum Report Content Requirements for Environmental Impacts on Aquatic Biodiversity	*Section where this has been addressed in the Specialist Report*
capacity, unseasonal flooding or destruction of floodplain processes); *b) will the proposed development change the sediment regime of the aquatic ecosystem and its sub -catchment (e.g. sand movement, meandering river mouth or estuary, flooding or sedimentation patterns);* *c) what will the extent of the modification in relation to the overall aquatic ecosystem be (e.g., at the source, upstream or downstream portion, in the temporary I seasonal I permanent zone of a wetland, in the riparian zone or within the channel of a watercourse, etc.); and* *d) to what extent will the risks associated with water uses and related activities change;*	
2.5.4. how will the proposed development impact on the functioning of the aquatic feature? This must include: *a) base flows (e.g., too little or too much water in terms of characteristics and requirements of the system);* *b) quantity of water including change in the hydrological regime or hydroperiod of the aquatic ecosystem (e.g., seasonal to temporary or permanent; impact of over - abstraction or instream or off stream impoundment of a wetland or river);* *c) change in the hydrogeomorphic typing of the aquatic ecosystem (e.g., change from an unchannelled valley-bottom wetland to a channelled valley -bottom wetland);* *d) quality of water (e.g., due to increased sediment load, contamination by chemical and/or organic effluent, and/or eutrophication);* *e) fragmentation (e.g., road or pipeline crossing a wetland) and loss of ecological connectivity (lateral and longitudinal); and* *f) the loss or degradation of all or part of any unique or important features associated with or within the aquatic ecosystem (e.g., waterfalls, springs, oxbow lakes, meandering or braided channels, peat soils, etc.);*	*Section 9 of this report*
2.5.5. how will the proposed development impact on key ecosystems regulating and supporting services especially: *a) flood attenuation;* *b) streamflow regulation;* *c) sediment trapping;* *d) phosphate assimilation;* *e) nitrate assimilation;* *f) toxicant assimilation;* *g) erosion control; and* *h) carbon storage?*	*Section 9 of this report*
2.5.6. how will the proposed development impact community composition (numbers and density of species) and integrity (condition, viability, predator - prey ratios, dispersal rates, etc.) of the faunal and vegetation communities inhabiting the site?	*Section 9 of this report*
2.6. In addition to the above, where applicable, impacts to the frequency of estuary mouth closure should be considered, in relation to:	*N/A*

Protocol for the Specialist Assessment and Minimum Report Content Requirements for Environmental Impacts on Aquatic Biodiversity	*Section where this has been addressed in the Specialist Report*
a) size of the estuary; *b) availability of sediment;* *c) wave action in the mouth;* *d) protection of the mouth;* *e) beach slope;* *f) volume of mean annual runoff; and* *g) extent of saline intrusion (especially relevant to permanently open systems).*	
2.7. The findings of the specialist assessment must be written up in an Aquatic Biodiversity Specialist Assessment Report that contains, as a minimum, the following information:	*This report*
2.7.1. contact details of the specialist, their SACNASP registration number, their field of expertise and a curriculum vitae;	*Appendix 1*
2.7.2. a signed statement of independence by the specialist;	*Attached to EIA / BAR*
2.7.3. a statement on the duration, date and season of the site inspection and the relevance of the season to the outcome of the assessment;	*Section 5 & 6 of this report*
2.7.4. the methodology used to undertake the site inspection and the specialist assessment, including equipment and modelling used, where relevant;	*Section 4*
2.7.5. a description of the assumptions made any uncertainties or gaps in knowledge or data;	*Section 1*
2.7.6. the location of areas not suitable for development, which are to be avoided during construction and operation, where relevant;	*Section 8*
2.7.7. additional environmental impacts expected from the proposed development;	*Section 9*
2.7.8. any direct, indirect, and cumulative impacts of the proposed development on site;	*Section 9*
2.7.9. the degree to which impacts, and risks can be mitigated;	*Section 9*
2.7.10. the degree to which the impacts and risks can be reversed;	*Section 9*
2.7.11. the degree to which the impacts and risks can cause loss of irreplaceable resources;	*Section 9*
2.7.12. a suitable construction and operational buffer for the aquatic ecosystem, using the accepted methodologies;	*Section 4*
2.7.13. proposed impact management actions and impact management outcomes for inclusion in the Environmental Management Programme (EMPr);	*Section 10, 11 & 12*
2.7.14. a motivation must be provided if there were development footprints identified as per paragraph 2.4 above that were identified as having a "low" aquatic biodiversity sensitivity and that were not considered appropriate;	*Section 9*
2.7.15. a substantiated statement, based on the findings of the specialist assessment, regarding the acceptability or not of the proposed development and if the proposed development should receive approval or not; and	*Section 13*
2.7.16. any conditions to which this statement is subjected.	*Section 11*
2.8. The findings of the Aquatic Biodiversity Specialist Assessment must be incorporated into the Basic Assessment Report or the Environmental Impact Assessment Report including the mitigation	*Yes*

Protocol for the Specialist Assessment and Minimum Report Content Requirements for Environmental Impacts on Aquatic Biodiversity	*Section where this has been addressed in the Specialist Report*
and monitoring measures as identified, that are to be included in the EMPr.	
2.9. A signed copy of the assessment must be appended to the Basic Assessment Report or Environmental Impact Assessment Report.	*Yes*

EIA PHASE FOR THE PROPOSED MULILO CLUSTER WEF, NEAR ERMELO, MPUMALANGA PROVINCE

Emvelo Wind Energy Facility

AQUATIC IMPACT ASSESSMENT

FOR

ERM Southern Africa (Pty) Ltd

REVISION 1

Executive Summary

ERM Southern Africa (Pty) Ltd appointed EnviroSci (Pty) Ltd to conduct an aquatic assessment of the proposed Mulilo Amsterdam Wind Energy Facility cluster between Ermelo and Amsterdam in the Mpumalanga Province. This report is focused on assessing the Emvelo Wind Energy Facility and its associated Overhead Line alignment

This assessment includes delineating any natural waterbodies, as well as assessing the potential consequences of the proposed project – The study area) on the surrounding wetlands and or watercourses. This was based on information collected during various site visits conducted within the region from March 2022 and a site-specific assessment in April & September 2023. Substantiated by the National Wetland Inventory v5.2 spatial data (NWI). Additional site visits were conducted in February 2025, while working in the region to confirm any changes since the initial surveys.

These surveys adhered to the assessment criteria contained in the DWAF 2005 / 2008 delineation manuals and the National Wetland Classification System. This report will inform the Environmental Authorisation process, as well as the required Water Use License Application that will be initiated, once the final project layout is available, i.e. once all the constraints, if any from this and other specialists have been considered in the design process.

The PROTOCOL FOR SPECIALIST ASSESSMENT AND MINIMUM REPORT CONTENT REQUIREMENTS FOR THE ENVIRONMENTAL IMPACTS ON AQUATIC BIODIVERSITY (Government Gazette 43110, 20 March 2020), superseding the Appendix 6 NEMA requirements, was also adhered to as results of the DFFE Screening tool indicated that portions of the study area are located within a VERY HIGH SENSITIVITY area, requiring this assessment. This is due to following being highlighted by the DFFE Screening Tool Results:

- Very High CBA: Aquatic rivers
- Very High CBA: Wetlands
- Very High ESA: Important sub catchments
- Very High ESA: Strategic Water Source Area (SWSA)
- Very High ESA: Wetland clusters
- Very High ESA: Wetlands
- Very High FEPA Subcatchment
- Very High Rivers_AB
- Very High Rivers_B
- Very High Rivers_C
- Very High SWSA (Surface Water) _Upper Usutu
- Very High SWSA (Surface Water) _Upper Vaal
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Seep)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Valley-bottom)
- Very High Wetlands_Mesic (Riverine)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Depression)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Floodplain)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Seep)

The proposed Wind Energy Facility (WEF) is located in the Inkomati-Usuthu Water Management Area, within the upper catchment of the Usuthu River (SQ W54A) and Mpama River (SQ W53B), while the proposed grid connection options are located in the Upper Vaal River (SQ C11B) in the Vaal Water Management Area. Thus, several permanent rivers and a variety of wetland hydrogeomorphic types are anticipated both associated with the riverine valleys and bench or plateaux areas located between river valleys on higher lying areas.

The study region is further characterised by several National Biodiversity Assessment (2018) Wetland Clusters, National Freshwater Ecosystem Area (NFEPAs), Threatened Ecosystems and Strategic Water Resources Areas.

The geology is mostly shales or sandstone of the Vryhied Group, with several intrusions associated with dolerite sills and dykes in areas associated with the Karoo Supergroup. This typically allows for the development of riverine areas, some with floodplains, interspersed by the rocky inselbergs and small ridges and or bench / plateaus observed.

Overall, these catchment and subsequent rivers / watercourses and wetlands range from a Largely Natural to transformed states. Current impacts occur in localised areas and included the following:

- Mining
- Large scale farming
- Forestry
- Erosion due small road crossings and tracks;
- Grazing; and
- Small to large river impoundments, and off channel farm dams.

In terms of the National Freshwater Ecosystems Priority Areas (NFEPA) assessment, all the watercourses within the site have been assigned a condition score of C (Nel et al. 2011), indicating that they are Moderately Modified, but still have biological significance, while the NBA (2018) data indicated that most mainstem system near the WEF, had a River Conservation Score of B (Usuthu) and B on the Vaal River. These scores were substantiated by observations made in the field within the study area, and due to the impacts or disturbance observed these scores would be upheld.

Any ratings will the also be substantiated with an assessment of the study area catchments linked to Critical Biodiversity Areas (CBA) and Ecological Support Areas, as shown in the Mpumalanga CBA spatial data.

The National Freshwater Ecosystems Priority Areas (NFEPA) (Nel *et al*., 2011), also earmarked sub-quaternaries, based either on the presence of important biota (e.g. rare or endemic fish species) or conversely the degree of riverine degradation, i.e. the greater the catchment degradation the lower the priority to conserve the catchment. The important catchments areas are then classified as Freshwater Ecosystems Priority Areas (FEPAs). The study area falls within several FEPA and Upstream FEPA catchments associated with the Usuthu & Vaal river systems. This is large due to the presence of several important fish and aquatic invertebrate habitats that as well as the provision and maintenance of flows within the lower catchments.

This report also indicates the significant watercourses and wetlands delineated within the study area, inclusive of the respective buffers. Any activities within these areas and or the 100m (riverine) 500m (wetland) regulated zones will require a Water Use license under Section 21 c & i of the National Water Act (Act 36 of 1998). The respective Water Use Licenses must be finalised once the preferred layout has been determined especially if any access roads will need to cross these areas, but it is advised that any new crossing over watercourses and wetlands areas are avoided.

Using the baseline description, aquatic features were identified, then categorised into one of number pre-determined sensitivity categories to provide protection and/or guide the layout planning processes. The sensitivity ratings of High (No-Go) to Low were determined through an assessment of the habitat sensitivity and related constraints. However, these No-Go areas (with buffers) relate in general terms to the project and there are areas where encroachment on these areas would occur (i.e. existing road crossings within systems) and this is considered acceptable since these areas are already disturbed.

These proposed constraints / buffers do not include bird buffers / constraints as theirs buffers along aquatic features are at times far larger around aquatic features, than those required for the known aquatic species within this region.

Development Component	Habitat type	Sensitivity rating of the respective habitat type against the development type	Buffer distance (m)	Development acceptability	Sensitivity rating override if an impact such as a road or other disturbance already occurs within the proposed footprint and confirmed by the specialist
WTG towers	Channelled Valley Bottom Wetlands	No-Go	105m	No WTGs should be placed in any of these areas, regardless of the state, type and functionality of the respective aquatic ecosystem	None
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		
Hardstands, Buildings / Substations & BESS	Channelled Valley Bottom Wetlands	No-Go	105m	None of these types of infrastructure should be placed in any of these areas	None
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		
Roads & Underground cables alignment roads	Channelled Valley Bottom Wetlands	High	105m	New roads and underground cables would not be deem appropriate within any of these areas, unless some form of disturbance already occurs, such as an existing track or bridge	Only existing tracks or disturbed areas may be used
	Pans and Depressions		95m		
	Rivers and Floodplains				
	Seeps		65m		
	Minor watercourses		35m		

Development Component	Habitat type	Sensitivity rating of the respective habitat type against the development type	Buffer distance (m)	Development acceptability	Sensitivity rating override if an impact such as a road or other disturbance already occurs within the proposed footprint and confirmed by the specialist
OHL	Channelled Valley Bottom Wetlands	High	105m	OHL towers must be placed outside of these area so that only the cables span these systems. The exception being that Pans & Depression inclusive of buffers must be avoided completely	
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		

In summary, any structures such as turbines/towers, crane pads, hardstands, buildings, substations and BESS, have been placed outside of the observed Very High Sensitivity watercourses, while any remaining structures (Roads and transmission lines) could cross or span the other sensitivity areas. Noting Low Sensitivity = Moderate areas but with existing impacts e.g., current roads, farm tracks of previously disturbed areas

The following direct impacts were assessed with regard the aquatic systems in this impact assessment phase based on the assumptions that any of the delineated Very High no-Go sensitivity areas shown in this assessment will either be avoided by the WEF components or spanned by the grid connections, noting that some access roads must cross some of these areas, but should preferably be within previously disturbed areas:

- Impact 1: Loss of habitat containing protected species or Species of Special Concern
- Impact 2: Loss of any critical corridors, important catchment areas and connected habitats that are linked to any Critical Biodiversity Areas or Ecological Support Areas
- Impact 3: The potential spread of alien vegetation
- Impact 4: Loss of riparian and or wetland habitat
- Impact 5: Changes to the hydrological regime and increased potential for erosion
- Impact 6: Changes to water quality
- Impact 7: Cumulative Impacts

During this assessment, several sensitive aquatic habitats were observed and are shown in the maps provided in this report. Noteworthy areas, were then avoided by the required infrastructure, and include the main riverine and wetland systems, while the access roads could will make use of existing roads thus previously disturbed areas.

If this is carried out, then the specialist has no objection to the authorisation of the proposed activities assuming that all mitigations and buffer zones are implemented.

Mitigation should focus on these areas and include measures to halt erosion and rehabilitate habitat in the sections affected by the construction. Without the implementation of mitigation measures, the project has potential to cause a Moderate cumulative impact upon aquatic biodiversity. However, with the adoption of mitigation, the proposed project will have a Low impact upon aquatic biodiversity.

As the proposed activities have the potential to create erosion the following recommendations are reiterated:

- Vegetation clearing should occur in a phased manner in accordance with the construction programme to minimise erosion and/or run-off. Large tracts of bare soil will either cause dust pollution or quickly erode and then cause sedimentation in the lower portions of the catchment, and suitable dust and erosion control mitigation measures should be included in the generic EMPr, if not included already to mitigate.
- All construction materials including fuels and oil should be stored in demarcated areas that are contained within berms / bunds to avoid spread of any contamination / leaks. Washing and cleaning of equipment should also be done in berms or bunds, to trap any cement / hazardous substances and prevent excessive soil erosion. Mechanical plant and bowsers must not be refuelled or serviced within or directly adjacent to any channel. It is therefore suggested that all construction camps, lay down areas, batching plants or areas and any stores should be located more than 50 m from any demarcated watercourses.
- It is also advised that an Environmental Control Officer (ECO), with a good understanding of the local flora be appointed during the construction phase. The ECO should be able to make clear recommendations with regards to the re-vegetation of the newly completed / disturbed areas along aquatic features, using selected species detailed in this report.
- All alien plant re-growth must be monitored and should these alien plants reoccur these plants should be re-eradicated. The scale of the operation does however not warrant the use of a Landscape Architect and / or Landscape Contractor.
- It is further recommended from the project onset that all watercourse areas (inclusive of buffers) are included into any existing EMPr as reference, this to ensure a net benefit to the aquatic environment. This should from part of the suggested walk down as part of the final EMP preparation.

SPECIALIST REPORT DETAILS

Report prepared by: Dr. Brian Colloty Pr.Sci.Nat. (Ecology) / Member SAEIES.

Expertise / Field of Study: BSc (Hons) Zoology, MSc Botany (Rivers), Ph. D Botany Conservation Importance rating (Estuaries) and interior wetland / riverine assessment consultant from 1996 to present.

I, Dr. Brian Michael Colloty declare that this report has been prepared independently of any influence or prejudice as may be specified by the National Department of Environmental Affairs and or Department of Human Settlement, Water and Sanitation.

Signed: ..... Date:15 August 2025.....

Appendix 1 of this report contains a detailed CV

This document contains intellectual property and proprietary information that is protected by copyright in favour of EnviroSci (Pty) Ltd. The document may therefore not be reproduced, or used without the prior written consent of EnviroSci (Pty) Ltd. This document is prepared exclusively for ERM Southern Africa (Pty) Ltd, their client and is subject to all confidentiality, copyright, trade secrets, and intellectual property law and practices of SOUTH AFRICA.

1. Introduction

ERM Southern Africa (Pty) Ltd appointed EnviroSci (Pty) Ltd to conduct an aquatic assessment of the proposed Mulilo Amsterdam Wind Energy Facility cluster between Ermelo and Amsterdam in the Mpumalanga Province. This report is focused on assessing the Emvelo Wind Energy Facility and its associated Overhead Line alternative corridors (Figure 1).

This assessment includes delineating any natural waterbodies, as well as assessing the potential consequences of the proposed project – The study area) on the surrounding wetlands and or watercourses. This was based on information collected during various site visits conducted within the region from March 2022 and a site-specific assessment in April & September 2023. Substantiated by the National Wetland Inventory v5.2 spatial data (NWI). Additional site visits were conducted in February 2025, while working in the region to confirm any changes since the initial surveys.

These surveys adhered to the assessment criteria contained in the DWAF 2005 / 2008 delineation manuals and the National Wetland Classification System. This report will inform the Environmental Authorisation process, as well as the required Water Use License Application that will be initiated, once the final project layout is available, i.e. once all the constraints, if any from this and other specialists have been considered in the design process.

The PROTOCOL FOR SPECIALIST ASSESSMENT AND MINIMUM REPORT CONTENT REQUIREMENTS FOR THE ENVIRONMENTAL IMPACTS ON AQUATIC BIODIVERSITY (Government Gazette 43110, 20 March 2020), superseding the Appendix 6 NEMA requirements, was also adhered to as results of the DFFE Screening tool indicated that portions of the study area are located within a VERY HIGH SENSITIVITY area, requiring this assessment. This is due to following being highlighted by the DFFE Screening Tool Results for the WEF study area and OHL assessment corridors:

- Very High CBA: Aquatic rivers
- Very High CBA: Wetlands
- Very High ESA: Important sub catchments
- Very High ESA: Strategic Water Source Area (SWSA)
- Very High ESA: Wetland clusters
- Very High ESA: Wetlands
- Very High FEPA Subcatchment
- Very High Rivers_AB
- Very High Rivers_B
- Very High Rivers_C
- Very High SWSA (Surface Water) _Upper Usutu
- Very High SWSA (Surface Water) _Upper Vaal
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Seep)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Valley-bottom)
- Very High Wetlands_Mesic (Riverine)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Depression)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Floodplain)
- Very High Wetlands_Mesic Highveld Grassland Bioregion (Seep)

Several important national, provincial and municipal scale conservation plans were also reviewed, with the results of those studies being included in this report. Most conservation plans are produced at a high level, so it is therefore important to verify the actual status of the study area during this initial phase, prior to the final layout plan being produced.

1.1 Aims and objectives

The aim of this report is to firstly provide a summary of the aquatic baseline and identify any No-Go areas. The report also makes recommendations with regard to further management and mitigation, to further reduce, avoid or mitigate the potential impacts and ultimately ensure the responsible and sustainable use of South

Africa's aquatic resources. The proposed layout was then assessed with regard the potential impacts and mitigations later in this report.

Certain aspects of the development could trigger the need for Section 21, Water Use License Applications (WULAs) (or general authorisation [GA] applications) such as river crossings or any activities within 500m of a wetland. Once the final layout receives Environmental Authorisation, these applications must then be submitted to the Department of Water and Sanitation (DWS).

Information regarding the state and function of the observed water bodies, including suitable no-go buffers areas is thus also provided. Information with regard to the state and function of the observed water bodies, suitable no-go buffers and assessment of the potential impacts are also provided, but it is the intent that where possible sensitive areas such as the wetlands will be avoided or spanned (OHL).

1.2 Assumptions and Limitation

To obtain a comprehensive understanding of the dynamics of both the flora and fauna of the aquatic communities within a study site, as well as the status of endemic, rare or threatened species in any area, assessments should always consider investigations at different time scales (across seasons/years) and through replication. No baseline long-term monitoring was undertaken as part of this assessment. However, a concerted effort was made to assess as much of the potential site, as well as make use of any available literature, species distribution data and aerial photography. Furthermore, based on the previous assessments undertaken between 2003 and 2023 in the area and this was not foreseen as a huge limiting factor. Detailed site visits conducted within the region from March 2022 and a site-specific assessment in April & September 2023 were also conducted. The level of investigation undertaken is sufficient to inform this assessment. Additional site visits were conducted in February 2025, while working in the region to confirm any changes since the initial surveys.

It should be emphasised that information, as presented in this document, only has reference to the study area as indicated on the accompanying maps. Therefore, this information cannot be applied to any other area without detailed investigation.

For the purposes of this report, it is assumed that any existing roads and tracks will be used, while structures will be placed outside the wetlands and or watercourses. A further assumption is that water will be sourced from a licensed resource and not illegally abstracted from any surrounding watercourses, particularly if dust suppression is required for example at the laydown areas or along main / district roads.

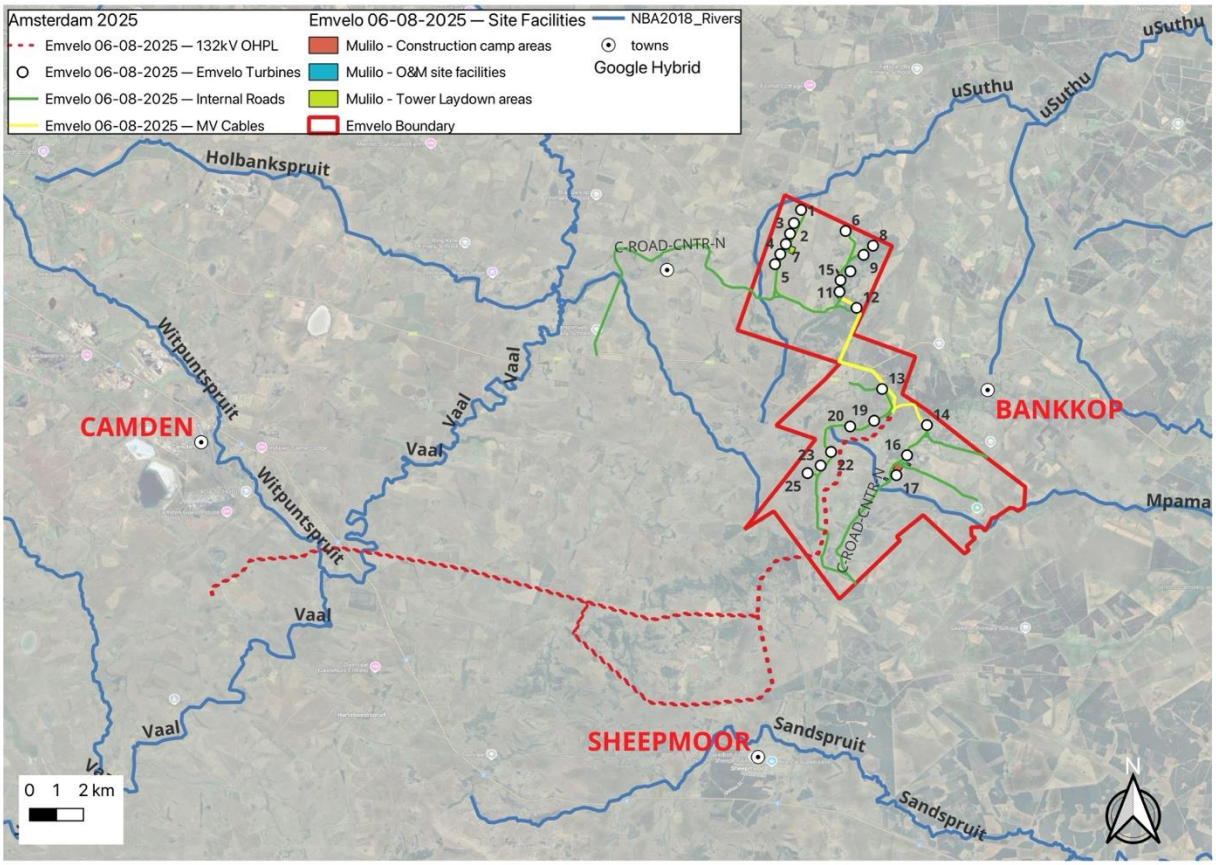

Figure 1: The proposed Wind Energy Facility (WEF) site boundaries, possible infrastructure layout (excluding hardstand and crane pads) and the potential OHL alignment

2. Terms of Reference

The proposed methods used in this assessment have been developed with the renewable industry in mind, coupled to the minimum requirements stipulated by DFFE and the Department of Water and Sanitation. These have been successful in assessing the direct, indirect and cumulative impacts of ca 200 renewable energy projects (2010 – 2023), of which 28 have been constructed:

- Desktop analysis
- Site investigation
- Compilation of one draft and one final site screening / sensitivity report for the project which adheres to the following (this list is not exhaustive):
    - The Initial Site Sensitivity Verification reporting requirements for environmental themes set out in Government Gazette No. 43110 which was promulgated on 20 March 2020 in terms of section 24(5)(a) and (h) of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA).
    - Identification and mapping of any discrepancies with the environmental sensitivity as identified on the national web based environmental screening tool.
    - Identification of sensitive areas to be avoided (including corresponding spatial data) and the determination of the respective buffers (if applicable) for each site.
    - Initial recommendations for the layout and allowable development footprint from a surface water and aquatic biodiversity perspective (including corresponding spatial data).
    - Recommendations regarding the areas to be utilised for solar technologies within the project site from a surface water and aquatic biodiversity perspective (including corresponding spatial data)
- Assess the potential impacts, based on a supplied methodology, including cumulative impacts and for pre-construction, construction, operations and decommissioning phases.

- Provide mitigations regarding project related impacts, including engineering services that could negatively affect demarcated wetland areas.
- Supply the client with geo-referenced GIS shape files of the wetland / riverine areas.
- Provide one draft report for comment, with a maximum of two rounds of comments addressed per project phase (max of 2).

3. Project Description

The following information was provided by the client:

Emvelo WEF is proposed to comprise up to 45 turbines with a maximum output capacity of up to 200 MW. The WEF will be located on nineteen (19) land parcels and will have an anticipated lifespan of 20 – 25 years. The final design which will be requested for approval in the EA, will be determined based on the outcome of the specialist studies undertaken for the EIA phase of the development. The proposed turbine footprints and associated facility infrastructure will cover an area of up to 180 ha after rehabilitation, depending on final layout design.

It is proposed that an on-site substation with a capacity up 132 kV and an up to 132 kV Overhead Powerline (OHPL) of approximately 30 km (300 m corridor) in distance, traversing eighteen (18) land parcels, be constructed to connect the proposed WEF to the Eskom Uitkoms Substation.

4. Methodology

This study followed the approaches of several national guidelines with regards to wetland assessment. These have been modified by the author, to provide a relevant mechanism of assessing the present state of the study systems, applicable to the specific environment and in a clear and objective manner, assess the potential impacts associated with the proposed development site based on information collected within the relevant farm portions of a number of years for this and other proposed projects.

Current water resource classification systems make use of the Hydrogeomorphic (HGM) approach, and for this reason, the National Wetland Classification System (NWCS) approach will be used in this study. It is also important to understand wetland definition, means of assessing wetland conservation and importance as well as understanding the pertinent legislation with regards to protecting wetlands. These aspects will be discussed in greater depth in this section of the report, as they form the basis of the study approach to assessing wetland impacts.

4.1 Waterbody classification systems

Since the late 1960's, wetland classification systems have undergone a series of international and national revisions. These revisions allowed for the inclusion of additional wetland types, ecological and conservation rating metrics, together with a need for a system that would allude to the functional requirements of any given wetland (Ewart-Smith *et al*., 2006). Wetland function is a consequence of biotic and abiotic factors, and wetland classification should strive to capture these aspects. Coupled to this was the inclusion of other criteria within the classification systems to differentiate between river, riparian and wetland systems, as well as natural versus artificial waterbodies.

The South African National Biodiversity Institute (SANBI) in collaboration with several specialists and stakeholders developed the newly revised and now accepted National Wetland Classification Systems (NWCS) (Ollis *et al*., 2013). This system comprises a hierarchical classification process of defining a wetland based on the principles of the hydrogeomorphic (HGM) approach at higher levels, with including structural features at the finer or lower levels of classification (Ollis *et al*., 2013).

Wetlands develop in a response to elevated water tables, linked either to rivers, groundwater flows or seepage from aquifers (Parsons, 2004). These water levels or flows then interact with localised geology and soil forms, which then determines the form and function of the respective wetlands. Water is thus the common driving force, in the formation of wetlands (DWAF, 2005). It is significant that the HGM approach has now been included in the wetland classifications as the HGM approach has been adopted throughout the water resources management realm with regards to the determination of the Present Ecological State (PES) and Ecological Importance and Sensitivity (EIS) and WET-Health assessments for aquatic environments. All these systems are then easily integrated using the HGM approach in line with the Eco-classification process of river and wetland reserve determinations used by the Department of Human Settlement, Water and Sanitation (DHSWS). The Ecological Reserve of a wetland or river is used by DHSWS to assess the water resource allocations when assessing WULAs.

The National Wetland Classification System process is provided in more detail in the methods section of the report, but some of the terms and definitions used in this document are presented below:

Definition Box

Present Ecological State is a term for the current ecological condition of the resource. This is assessed relative to the deviation from the Reference State. Reference State/Condition is the natural or pre-impacted condition of the system. The reference state is not a static condition but refers to the natural dynamics (range and rates of change or flux) prior to development. The PES is determined per component - for rivers and wetlands this would be for the drivers: flow, water quality and geomorphology; and the biotic response indicators: fish, macroinvertebrates, riparian vegetation and diatoms. PES categories for every component would be integrated into an overall PES for the river reach or wetland being investigated. This integrated PES is called the EcoStatus of the reach or wetland.

EcoStatus is the overall PES or current state of the resource. It represents the totality of the features and characteristics of a river and its riparian areas or wetland that bear upon its ability to support an appropriate natural flora and fauna and its capacity to provide a variety of goods and services. The EcoStatus value is an integrated ecological state made up of a combination of various PES findings from component EcoStatus assessments (such as for invertebrates, fish, riparian vegetation, geomorphology, hydrology and water quality).

Reserve: The quantity and quality of water needed to sustain basic *human needs* and *ecosystems* (e.g. estuaries, rivers, lakes, groundwater and wetlands) to ensure ecologically sustainable development and utilisation of a water resource. The *Ecological Reserve* pertains specifically to aquatic ecosystems.

Reserve requirements: The quality, quantity and reliability of water needed to satisfy the requirements of basic human needs and the Ecological Reserve (inclusive of instream requirements).

Ecological Reserve determination study: The study undertaken to determine Ecological Reserve requirements.

Licensing applications: Water users are required (by legislation) to apply for licenses prior to extracting water resources from a water catchment.

Ecological Water Requirements: This is the quality and quantity of water flowing through a natural stream course that is needed to sustain instream functions and ecosystem integrity at an acceptable level as determined during an EWR study. These then form part of the conditions for managing achievable water quantity and quality conditions as stipulated in the Reserve Template

Water allocation process (compulsory licensing): This is a process where all existing and new water users are requested to reapply for their licenses, particularly in stressed catchments where there is an over-allocation of water or an inequitable distribution of entitlements.

Ecoregions are geographic regions that have been delineated in a top-down manner on the basis of physical/abiotic factors. • NOTE: For purposes of the classification system, the 'Level I Ecoregions' for South Africa, Lesotho and Swaziland (Kleynhans *et al.* 2005), which have been specifically developed by the Department of Water Affairs & Forestry (DWAF) for rivers but are used for the management of inland aquatic ecosystems more generally, are applied at Level 2A of the classification system. These Ecoregions are based on physiography, climate, geology, soils and potential natural vegetation.

4.2 Wetland definition

Although the National Wetland Classification System (NWCS) (Ollis *et al*., 2013) is used to classify wetland types, it is still necessary to understand the definition of a wetland. Terminology currently strives to characterise a wetland not only on its structure (visible form), but also to relate this to the function and value of any given wetland.

The Ramsar Convention definition of a wetland is widely accepted as "areas of marsh, fen, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed six metres" (Davis 1994). South Africa is a signatory to the Ramsar Convention and therefore its extremely broad definition of wetlands has been adopted for the proposed NWCS, with a few modifications.

Whereas the Ramsar Convention included marine water to a depth of six metres, the definition used for the NWCS extends to a depth of ten metres at low tide, as this is recognised as the seaward boundary of the shallow photic zone (Lombard et al., 2005). An additional minor adaptation of the definition is the removal of the term

'fen' as fens are considered a type of peatland. The adapted definition for the NWCS is, therefore, as follows (Ollis *et al*., 2013):

WETLAND: an area of marsh, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed ten metres.

This definition encompasses all ecosystems characterised by the permanent or periodic presence of water other than marine waters deeper than ten metres. The only legislated definition of wetlands in South Africa, however, is contained within the National Water Act (Act No. 36 of 1998) (NWA), where wetlands are defined as "land which is transitional between terrestrial and aquatic systems, where the water table is usually at, or near the surface, or the land is periodically covered with shallow water and which land in normal circumstances supports, or would support, vegetation adapted to life in saturated soil." This definition is consistent with more precise working definitions of wetlands and therefore includes only a subset of ecosystems encapsulated in the Ramsar definition. It should be noted that the NWA definition is not concerned with marine systems and clearly distinguishes wetlands from estuaries, classifying the latter as a watercourse (Ollis *et al*., 2013). Table 1 below provides a comparison of the various wetlands included within the main sources of wetland definitions used in South Africa.

Although a subset of Ramsar-defined wetlands was used as a starting point for the compilation of the first version of the National Wetland Inventory (i.e. "wetlands", as defined by the NWA, together with open waterbodies), it is understood that subsequent versions of the Inventory include the full suite of Ramsar-defined wetlands in order to ensure that South Africa meets its wetland inventory obligations as a signatory to the Convention (Ollis *et al.*, 2013).

Wetlands must therefore have one or more of the following attributes to meet the above definition (DWAF, 2005):

- A high-water table that results in the saturation at or near the surface, leading to anaerobic conditions developing in the top 50 cm of the soil.
- Wetland or hydromorphic soils that display characteristics resulting from prolonged saturation, i.e. mottling or grey soils
- The presence of, at least occasionally, hydrophilic plants, i.e. hydrophytes (water loving plants).

It should be noted that riparian systems that are not permanently or periodically inundated are not considered true wetlands, i.e. those associated with the drainage lines and rivers.

Table 1: Comparison of ecosystems considered to be 'wetlands' as defined by the proposed NWCS, the NWA and ecosystems included in DWAF's (2005) delineation manual.

Ecosystem	NWCS "wetland"	National Water Act wetland	DWAF (2005) delineation manual
Marine	YES	NO	NO
Estuarine	YES	NO	NO
Waterbodies deeper than 2 m (i.e. limnetic habitats often described as lakes or dams)	YES	NO	NO
Rivers, channels and canals	YES	NO[1]	NO
Inland aquatic ecosystems that are not river channels and are less than 2 m deep	YES	YES	YES
Riparian[2] areas that are permanently / periodically inundated or saturated with water within 50 cm of the surface	YES	YES	YES[3]
Riparian [3] areas that are not permanently / periodically inundated or saturated with water within 50 cm of the surface	NO	NO	YES[3]

[1] Although river channels and canals would generally not be regarded as wetlands in terms of the National Water Act, they are included as a 'watercourse' in terms of the Act

[2] According to the National Water Act and Ramsar, riparian areas are those areas that are saturated or flooded for prolonged periods and would be considered riparian wetlands, as opposed to non –wetland riparian areas that are only periodically inundated and the riparian vegetation persists due to having deep root systems drawing on water many meters below the surface.

[3] The delineation of 'riparian areas' (including both wetland and non-wetland components) is treated separately to the delineation of wetlands in DWAF's (2005) delineation manual.

4.3 National Wetland Classification System method

During this study, due to the nature of the wetlands and watercourses observed, it was determined that the newly accepted NWCS be adopted. This classification approach has integrated aspects of the HGM approach used in the WET-Health system as well as the widely accepted eco-classification approach used for rivers.

The NWCS (Ollis *et al*., 2013) as stated previously, uses hydrological and geomorphological traits to distinguish the primary wetland units, i.e. direct factors that influence wetland function. Other wetland assessment techniques, such as the DWAF (2005) delineation method, only infer wetland function based on abiotic and biotic descriptors (size, soils & vegetation) stemming from the Cowardin approach (Ollis *et al.,* 2013).

The classification system used in this study is thus based on Ollis *et al*. (2013) and is summarised below:

The NWCS has a six-tiered hierarchical structure, with four spatially nested primary levels of classification (Figure 2). The hierarchical system firstly distinguishes between Marine, Estuarine and Inland ecosystems (Level 1), based on the degree of connectivity the particular system has with the open ocean (greater than 10 m in depth). Level 2 then categorises the regional wetland setting using a combination of biophysical attributes at the landscape level, which operate at a broad bioregional scale.

This is opposed to specific attributes such as soils and vegetation. Level 2 has adopted the following systems:

- Inshore bioregions (marine)
- Biogeographic zones (estuaries)
- Ecoregions (Inland)

Level 3 of the NWCS assess the topographical position of inland wetlands as this factor broadly defines certain hydrological characteristics of the inland systems. Four landscape units based on topographical position are used in distinguishing between Inland systems at this level. No subsystems are recognised for Marine systems, but estuaries are grouped according to their periodicity of connection with the marine environment, as this would affect the biotic characteristics of the estuary.

Level 4 classifies the hydrogeomorphic (HGM) units discussed earlier. The HGM units are defined as follows:

- Landform – shape and localised setting of wetland
- Hydrological characteristics – nature of water movement into, through and out of the wetland
- Hydrodynamics – the direction and strength of flow through the wetland

These factors characterise the geomorphological processes within the wetland, such as erosion and deposition, as well as the biogeochemical processes.

Level 5 of the assessment pertains to the classification of the tidal regime within the marine and estuarine environments, while the hydrological and inundation depth classes are determined for inland wetlands. Classes are based on frequency and depth of inundation, which are used to determine the functional unit of the wetlands and are considered secondary discriminators within the NWCS.

Level 6 uses six descriptors to characterise the wetland types based on biophysical features. As with Level 5, these are non-hierarchal in relation to each other and are applied in any order, dependent on the availability of information. The descriptors include:

- Geology;
- Natural vs. Artificial;
- Vegetation cover type;
- Substratum;
- Salinity; and
- Acidity or Alkalinity.

It should be noted that where sub-categories exist within the above descriptors, hierarchical systems are employed, and these are thus nested in relation to each other.

The HGM unit (Level 4) is the focal point of the NWCS, with the upper levels (Figure 3 – Inland systems only) providing means to classify the broad bio-geographical context for grouping functional wetland units at the HGM level, while the lower levels provide more descriptive detail on the particular wetland type characteristics of a particular HGM unit. Therefore Level 1 – 5 deals with functional aspects, while Level 6 classifies wetlands on structural aspects.

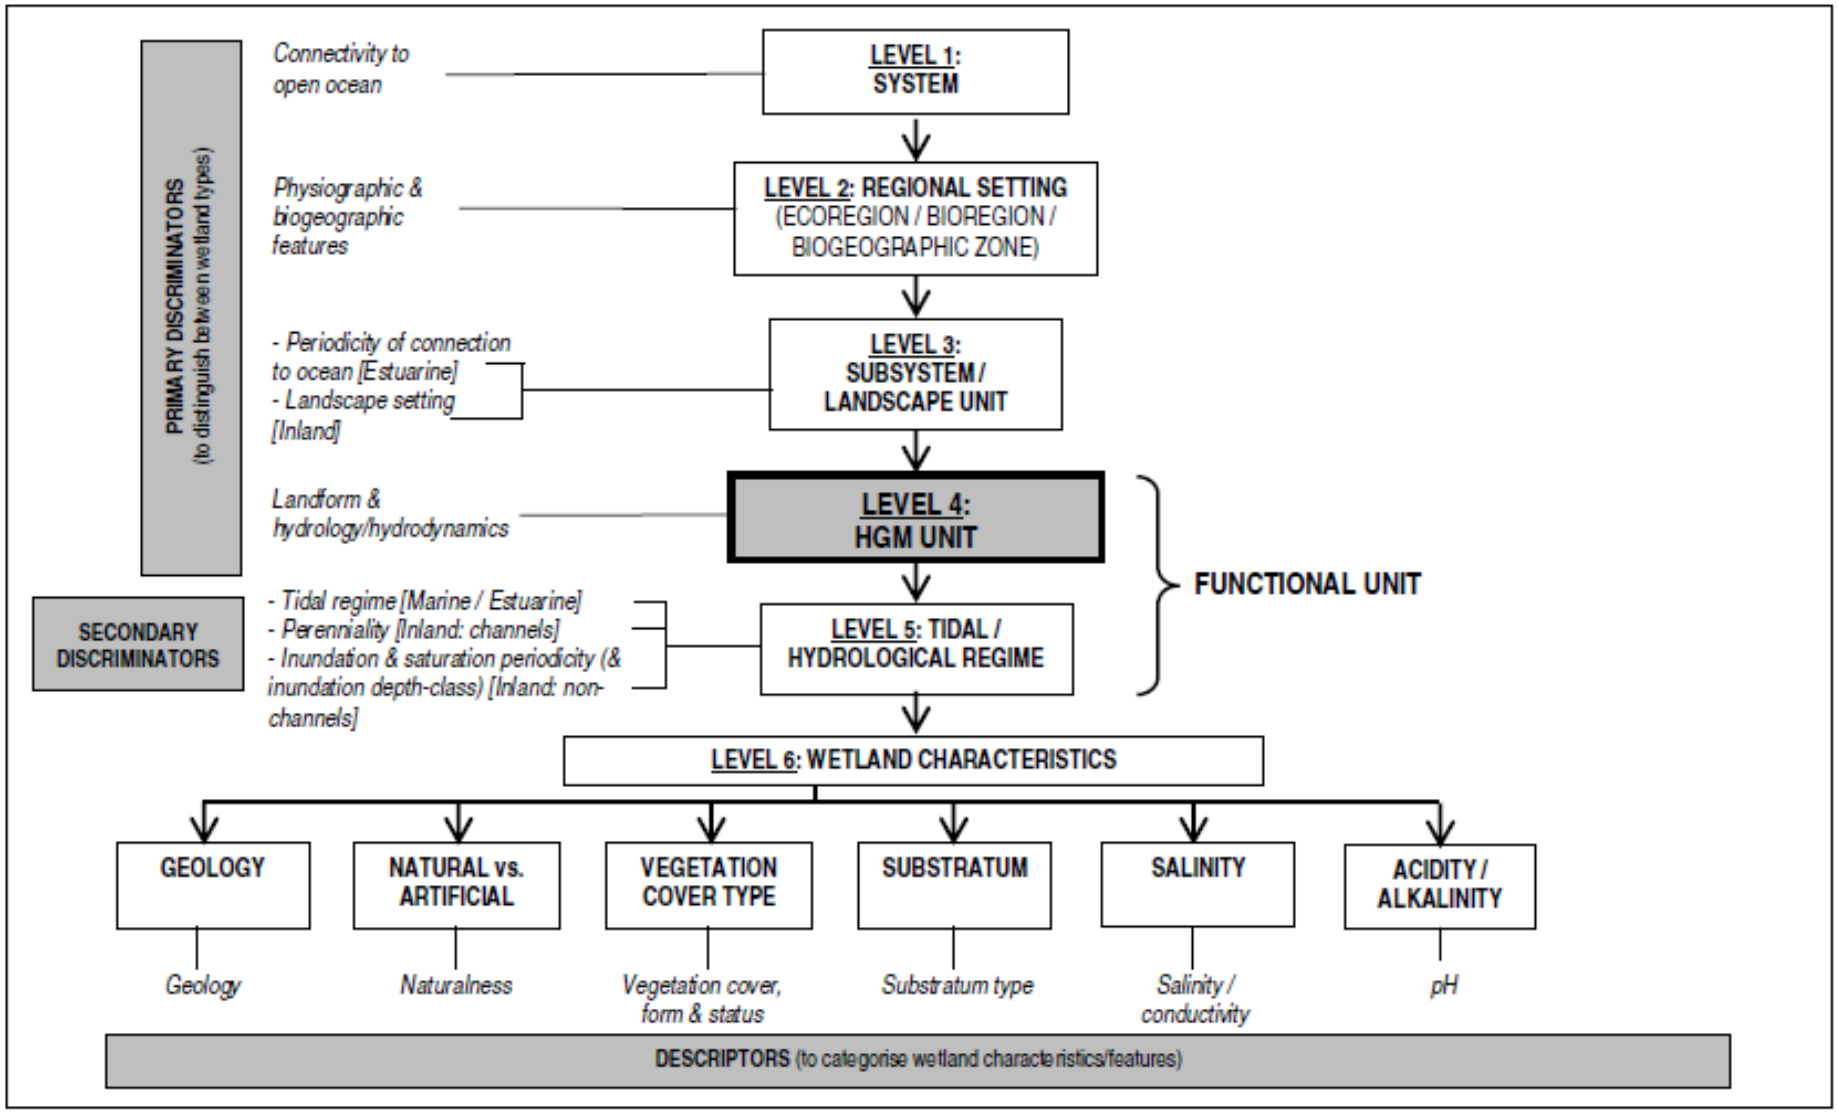

Figure 2: Basic structure of the NWCS, showing how 'primary discriminators' are applied up to Level 4 to classify Hydrogeomorphic (HGM) Units, with 'secondary discriminators' applied at Level 5 to classify the tidal/hydrological regime, and 'descriptors' applied at Level 6 to categorise the characteristics of wetlands classified up to Level 5 (From Ollis *et al*., 2013).

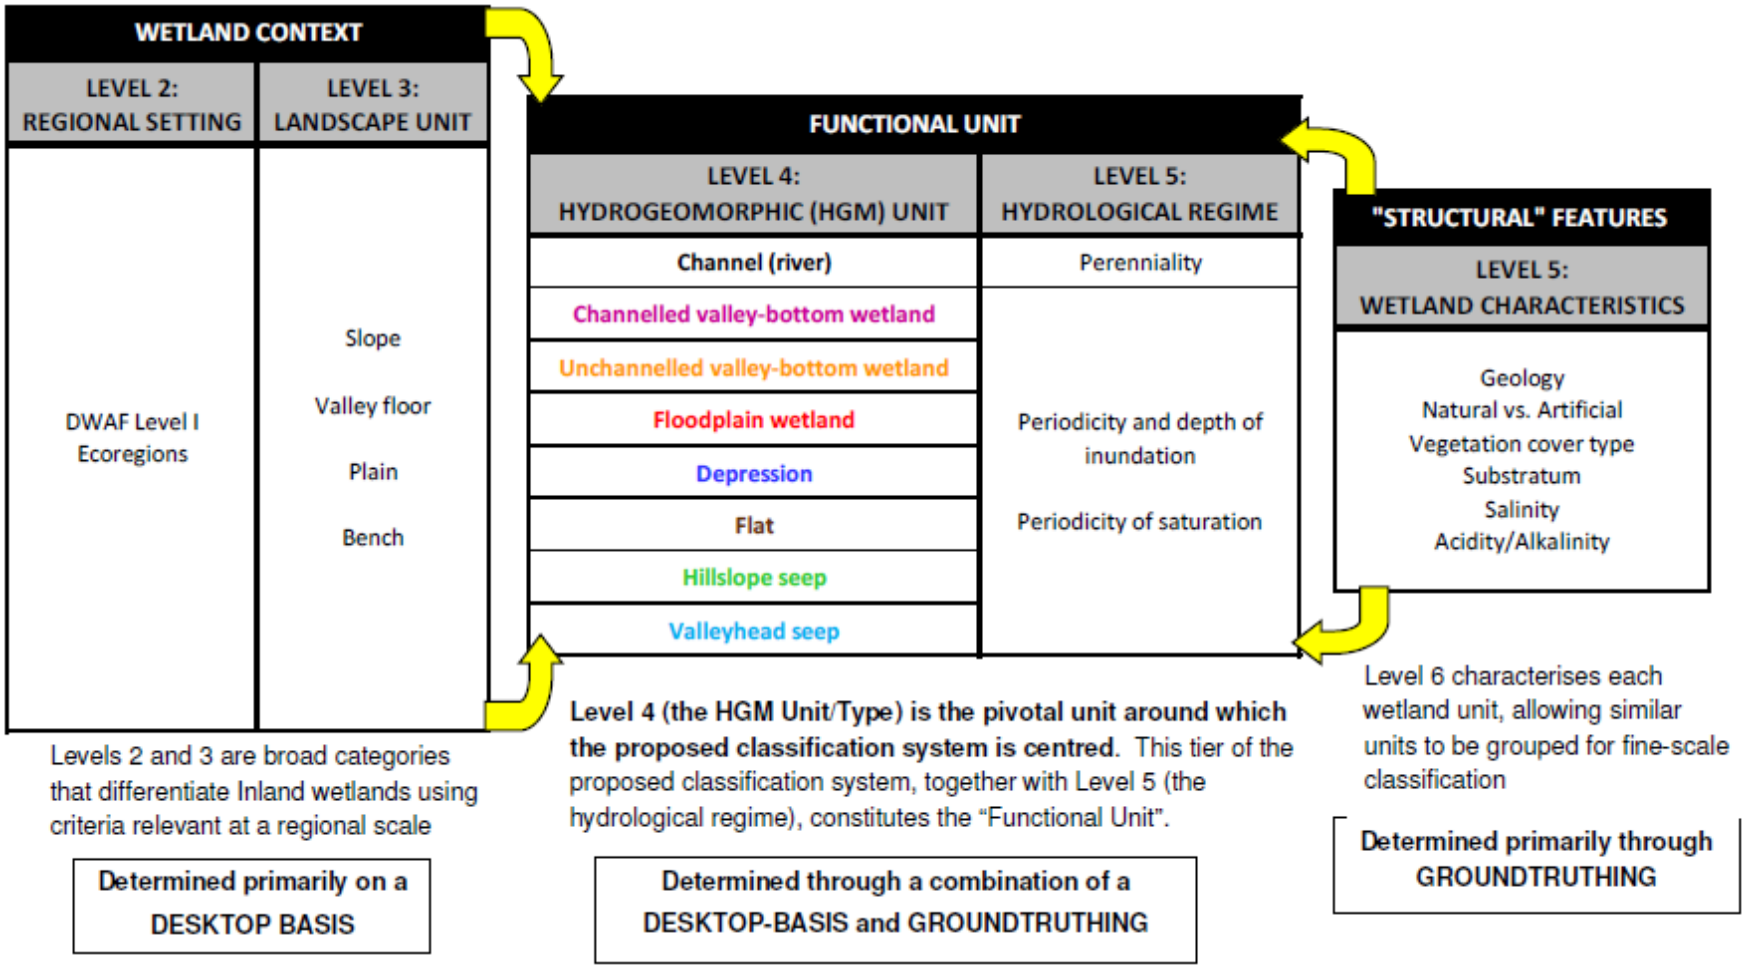

Figure 3: Illustration of the conceptual relationship of HGM Units (at Level 4) with higher and lower levels (relative sizes of the boxes show the increasing spatial resolution and level of detail from the higher to the lower levels) for Inland Systems (from Ollis *et al*., 2013).

4.4 Waterbody condition

To assess the PES or condition of the observed wetlands, a modified Wetland Index of Habitat Integrity (DWAF, 2007) was used. The Wetland Index of Habitat Integrity (WETLAND-IHI) is a tool developed for use in the National Aquatic Ecosystem Health Monitoring Programme (NAEHMP), formerly known as the River Health Programme (RHP). The output scores from the WETLAND-IHI model are presented in the standard DWAF A-F ecological categories (Table 2) and provide a score of the PES of the habitat integrity of the wetland system being examined. The author has included additional criteria into the model-based system to include additional wetland types. This system is preferred when compared to systems such as WET-Health – wetland management series (WRC 2009), as WET-Health (Level 1) was developed with wetland rehabilitation in mind and is not always suitable for impact assessments. This coupled with the degraded state of the wetlands in the study area, indicated that a complex study approach was not warranted, i.e. conduct a Wet-Health Level 2 and WET-Ecosystems Services study required for an impact assessment.

Table 2: Description of A – F ecological categories based on Kleynhans *et al*., (2005)

ECOLOGICAL CATEGORY	ECOLOGICAL DESCRIPTION	MANAGEMENT PERSPECTIVE
A	Unmodified, natural.	Protected systems; relatively untouched by human hands; no discharges or impoundments allowed
B	Largely natural with few modifications. A small change in natural habitats and biota may have taken place but the ecosystem functions are essentially unchanged.	Some human-related disturbance, but mostly of low impact potential
C	Moderately modified. Loss and change of natural habitat and biota have occurred, but the basic ecosystem functions are still predominantly unchanged.	Multiple disturbances associated with need for socio-economic development, e.g. impoundment, habitat modification and water quality degradation
D	Largely modified. A large loss of natural habitat, biota and basic ecosystem functions has occurred.	
E	Seriously modified. The loss of natural habitat, biota and basic ecosystem functions is extensive.	Often characterized by high human densities or extensive resource exploitation. Management intervention is needed to improve health, e.g. to restore flow patterns, river habitats or water quality
F	Critically / Extremely modified. Modifications have reached a critical level and the system has been modified completely with an almost complete loss of natural habitat and biota. In the worst instances the basic ecosystem functions have been destroyed and the changes are irreversible.	

The WETLAND-IHI model is composed of four modules. The "Hydrology", "Geomorphology" and "Water Quality" modules all assess the contemporary driving processes behind wetland formation and maintenance. The last module, "Vegetation Alteration", provides an indication of the intensity of human land use activities on the wetland surface itself and how these may have modified the condition of the wetland. The integration of the scores from these 4 modules provides an overall PES score for the wetland system being examined. The WETLAND-IHI model is an MS Excel-based model, and the data required for the assessment are generated during a site visit.

Additional data may be obtained from remotely sensed imagery (aerial photos; maps and/or satellite imagery) to assist with the assessment. The interface of the WETLAND-IHI has been developed in a format which is similar to DWA's River EcoStatus models which are currently used for the assessment of PES in riverine environments.

4.5 Aquatic ecosystem importance and function

South Africa is a Contracting Party to the Ramsar Convention on Wetlands, signed in Ramsar, Iran, in 1971, and has thus committed itself to this intergovernmental treaty, which provides the framework for the national protection of wetlands and the resources they could provide. Wetland conservation is now driven by the South African National Biodiversity Institute, a requirement under the National Environmental Management: Biodiversity Act (No 10 of 2004).

Wetlands are among the most valuable and productive ecosystems on earth, providing important opportunities for sustainable development (Davies and Day, 1998). However, wetlands in South Africa are still rapidly being lost or degraded through direct human induced pressures (Nel *et al.,* 2004).

The most common attributes or goods and services provided by wetlands include:

- Improve water quality;
- Impede flow and reduce the occurrence of floods;
- Reeds and sedges used in construction and traditional crafts;
- Bulbs and tubers, a source of food and natural medicine;
- Store water and maintain base flow of rivers;
- Trap sediments; and
- Reduce the number of water-borne diseases.

In terms of this study, the wetlands provide ecological (environmental) value to the area acting as refugia for various wetland associated plants, butterflies and birds.

In the past wetland conservation has focused on biodiversity as a means of substantiating the protection of wetland habitat. However not all wetlands provide such motivation for their protection, thus wetland managers and conservationists began assessing the importance of wetland function within an ecosystem.

Table 3 below summarises the importance of wetland function when related to ecosystem services or ecoservices (Kotze *et al*., 2008). One such example is emergent reed bed wetlands that function as transformers converting inorganic nutrients into organic compounds (Mitsch and Gosselink, 2000).

Table 3: Summary of direct and indirect ecoservices provided by wetlands from Kotze *et al*., 2008

Ecosystem services supplied by wetlands	Indirect benefits	Hydro-geochemical benefits		Flood attenuation
				Stream flow regulation
			Water quality enhancement benefits	Sediment trapping
				Phosphate assimilation
				Nitrate assimilation
				Toxicant assimilation
				Erosion control
				Carbon storage
		Biodiversity maintenance		
	Direct benefits	*Provision of water for human use*		
		Provision of harvestable resources[2]		
		Provision of cultivated foods		
		Cultural significance		
		Tourism and recreation		
		Education and research		

Conservation importance of the individual wetlands was based on the following criteria:

- Habitat uniqueness;
- Species of conservation concern;
- Habitat fragmentation or rather, continuity or intactness with regards to ecological corridors; and
- Ecosystem service (social and ecological).

The presence of any or a combination of the above criteria would result in a HIGH conservation rating if the wetland was found in a near natural state (high PES). Should any of the habitats be found modified the conservation importance would rate as MEDIUM, unless a Species of Conservation Concern (SCC) was observed, in which case it would receive a HIGH rating. Any system that was highly modified (low PES) or had none of the above criteria, received a LOW conservation importance rating. Wetlands with HIGH and MEDIUM ratings should thus be excluded from development with incorporation into a suitable open space system, with the maximum possible buffer being applied. Natural wetlands or Wetlands that resemble some form of the past landscape but receive a LOW conservation importance rating could be included into stormwater management features and should not be developed to retain the function of any ecological corridors.

4.6 Relevant wetland legislation and policy

Locally the South African Constitution, seven (7) Acts and two (2) international treaties allow for the protection of wetlands and rivers. These systems are protected from destruction or pollution by the following:

- Section 24 of The Constitution of the Republic of South Africa, 1996;
- Agenda 21 – Action plan for sustainable development of the Department of Environmental Affairs and Tourism (DEAT) 1998;
- The Ramsar Convention, 1971 including the Wetland Conservation Programme (DEAT) and the National Wetland Rehabilitation Initiative (DEAT, 2000);
- National Environmental Management Act (NEMA), 1998 (Act No. 107 of 1998) inclusive of all amendments, as well as the NEM: Biodiversity Act;
- National Water Act, 1998 (Act No. 36 of 1998);
- Conservation of Agricultural Resources Act, 1983 (Act No. 43 of 1983); and
- Minerals and Petroleum Resources Development Act, 2002 (Act No. 28 of 2002).
- Nature and Environmental Conservation Ordinance, 1974 (No. 19 of 1974)
- National Forest Act, 1998 (No. 84 of 1998)
- National Heritage Resources Act, 1999 (No. 25 of 1999)

NEMA and the Conservation of Agricultural Resources Act (CARA), 1983 (Act No. 43 of 1983) would also apply to this project. These Acts have categorised many invasive plants together with associated obligations on the landowner.

4.7 Provincial legislation and policy

Currently riverine and wetland buffers distances are calculated using the model described by Macfarlane *&* Bredin (2017). Site specific information was collected during the visit and is used to determine site and development specific range of buffers. In short, the buffer distances are based on the current condition of the waterbody, the state of the remainder of the site, the potential impacts posed by the type and scale of the of development, as wells as the proposed alteration of hydrological flows. The model also takes cognisance of the level of mitigation possible, coupled to the reversibility of the impacts. Based then on the information known for the site the buffer model provided the following:

Channelled Valley Bottom Wetlands	65m
Pans and Depressions	105m
Rivers and Floodplains	95m
Seeps	65m
Minor watercourses	35m

Artificial dams were not buffered.

5. Description of the affected environment

This baseline description was a summer and winter survey of the study area that spanned a total of two weeks and conducted in February / March 2022 (late summer) and a site-specific assessment in April (Autumn) & September (Later winter) 2023. Additional site visits were conducted in February 2025, while working in the region to confirm any changes since the initial surveys.

The study area was dominated by a variety of aquatic features associated with catchments and rivers, characterised as follows:

- Mainstem Rivers: Floodplain dominated systems with floodplain wetlands (Plate 1). A few reaches did contain very narrow riparian zones, consisting mostly of a single row of willow trees associated with the Vaal River
- Valley Bottom Wetlands (Channelled and Unchanneled) (Plate 2)
- Endorheic pans (Plate 3)
- Seep wetlands (Plate 4)

The proposed Wind Energy Facility (WEF) is located in the Inkomati-Usuthu Water Management Area, within the upper catchment of the Usuthu River (SQ W54A) and Mpama Rivers (SQ W53B), while the proposed grid connection options are located in the Upper Vaal River (SQ C11B) in the Vaal Water Management Area (Figure 4). Thus, several permanent rivers and a variety of wetland hydrogeomorphic types are anticipated both associated with the riverine valleys and bench or plateaux areas located between river valleys on higher lying areas (Figure 5).

The study region is further characterised by several National Biodiversity Assessment (2018) Wetland Clusters, National Freshwater Ecosystem Area (NFEPAs) and Strategic Water Resources Areas (Figure 6)

The geology is mostly shales or sandstone of the Vryhied Group, with several intrusions associated with dolerite sills and dykes in areas associated with the Karoo Supergroup. This typically allows for the development of riverine areas, some with floodplains, interspersed by the rocky inselbergs and small ridges and or bench / plateaus observed.

Overall, these catchment and subsequent rivers / watercourses and wetlands range from a Largely Natural to transformed states. Current impacts occur in localised areas and included the following:

- Mining
- Large scale farming
- Forestry
- Erosion due small road crossings and tracks;
- Grazing; and
- Small to large river impoundments, and off channel farm dams.

In terms of the National Freshwater Ecosystems Priority Areas (NFEPA) assessment, all the watercourses within the site have been assigned a condition score of C (Nel et al. 2011), indicating that they are Moderately Modified, but still have biological significance, while the NBA (2018) data indicated that most mainstem system near the WEF, had a River Conservation Score of B (Usuthu) and B on the Vaal River. These scores were substantiated by observations made in the field within the study area, and due to the impacts or disturbance observed these scores would be upheld.

Any ratings will the also be substantiated with an assessment of the study area catchments linked to Critical Biodiversity Areas (CBA) and Ecological Support Areas, as shown in the Mpumalanga CBA spatial data.

The National Freshwater Ecosystems Priority Areas (NFEPA) (Nel *et al*., 2011), also earmarked sub-quaternaries, based either on the presence of important biota (e.g. rare or endemic fish species) or conversely the degree of riverine degradation, i.e. the greater the catchment degradation the lower the priority to conserve the catchment. The important catchments areas are then classified as Freshwater Ecosystems Priority Areas (FEPAs).

The study area falls within several FEPA and Upstream FEPA catchments associated with the Usuthu & Vaal river systems. This is large due to the presence of several important fish and aquatic invertebrate habitats that as well as the provision and maintenance of flows within the lower catchments.

Notably the following fish are commonly found in the study areas systems (Freshwater Biodiversity Information System - FBIS):

Fish Taxon	Conservation status
Enteromius anoplus (Weber, 1897)	Least concern
Enteromius pallidus (Smith, 1841)	Least concern
Enteromius paludinosus (Peters, 1852)	Least concern
Pseudocrenilabrus philander (Weber, 1897)	Least concern

The FBIS site data from 44 sites (https://freshwaterbiodiversity.org/map/#search//taxon=&search=&siteId=&collector=&category=&yearFrom=&yearTo=&months=&boundary=&userBoundary=&) spanning the study area also indicated a total of 200 aquatic invertebrate species, none currently listed as conservation needy as well as the following aquatic plants that were confirmed in this assessment

Plant Taxon	Conservation Status
Agrostis continuata Stapf	Not evaluated
Andropogon eucomus Nees	Least concern
Andropogon lacunosus J.G.Anderson	Least concern
Arundinella nepalensis Trin.	Not evaluated
Berula thunbergii (DC.) H.Wolff	Least concern
Brachiaria bovonei (Chiov.) Robyns	Least concern
Carex rhodesiaca Nelmes	Least concern
Chironia purpurascens (E.Mey.) Benth. & Hook.fil.	Least concern
Crinum bulbispermum (Burm.f.) Milne-Redh. & Schweick.	Least concern
Cyperus denudatus L.f.	Least concern
Cyperus macranthus Boeckeler	Not evaluated
Cyperus melanospermus (Nees) Valck.Sur.	Not evaluated
Cyperus nitidus Lam.	Not evaluated
Denekia capensis Thunb.	Not evaluated
Drosera collinsae N.E.Br. ex BurttDavy	Least concern
Echinochloa jubata Stapf	Least concern
Eleocharis dregeana Steud.	Least concern
Eleocharis limosa (Schrad.) Schult.	Least concern
Festuca caprina Nees	Not evaluated
Fimbristylis complanata (Retz.) Link	Least concern
Fuirena pubescens (Poir.) Kunth	Least concern
Geranium multisectum N.E.Br.	Least concern
Geranium wakkerstroomianum R.Knuth	Least concern
Gladiolus papilio Hook.f.	Not evaluated
Gunnera perpensa L.	Least concern
Hesperantha hygrophila Hilliard & B.L.Burtt	Least concern
Isolepis costata Hochst. ex A.Rich.	Not evaluated
Juncus effusus L.	Least concern
Juncus oxycarpus E.Mey. ex Kunth	Least concern
Lagarosiphon muscoides Harv.	Least concern

Leersia hexandra Sw.	Least concern
Limosella major Diels	Least concern
Miscanthus junceus (Stapf) Pilg.	Least concern
Nymphoides thunbergiana (Griseb.) Kuntze	Least concern
Odontelytrum abyssinicum Hack.	Least concern
Ornithogalum flexuosum (Thunb.) U.Müll.-Doblies & D.Müll.-Doblies	Not evaluated
Pennisetum macrourum Trin.	Least concern
Persicaria decipiens (R.Br.) K.L.Wilson	Least concern
Persicaria madagascariensis (Meisn.) S.Ortiz & Paiva	Not evaluated
Pterygodium nigrescens (Sond.) Schltr.	Least concern
Ranunculus multifidus Forssk.	Least concern
Rhynchospora brownii Roem. & Schult.	Least concern
Rorippa nudiuscula (E.Mey. ex Sond.) Thell.	Least concern
Sacciolepis typhura (Stapf) Stapf	Least concern
Schoenoplectus muriculatus (Kük.) Browning	Not evaluated
Schoenoplectus paludicola (Kunth) J.Raynal, 1976	Least concern
Typha capensis (Rohrb.) N.E.Br.	Not evaluated
Veronica anagallis-aquatica L.	Not evaluated
Xyris gerrardii N.E.Br.	Least concern

Plate 4: Seepage wetland in the headwater areas of the Vaal River / Usutu River catchment divide

6. Present Ecological State and conservation importance

The PES of a river represents the extent to which it has changed from the reference or near pristine condition (Category A) towards a highly impacted system where there has been an extensive loss of natural habit and biota, as well as ecosystem functioning (Category E).

The PES scores have been revised for the country and based on the current models, aspects of functional importance as well as direct and indirect impacts have been included (DWS, 2014). The current PES system also incorporates Ecological Importance (EI) and Ecological Sensitivity (ES) separately as opposed to Ecological Importance and Sensitivity (EIS) in the old model, although the new model is still heavily centred on rating rivers using broad fish, invertebrate, riparian vegetation and water quality indicators. The Recommended Ecological Category (REC) is still contained within the updated models, with the default REC being B, when little or no information is available to assess the system or when only one of the above-mentioned parameters are assessed or the overall PES is rated between a C or D.

The Present Ecological State scores (PES) for the main watercourses in the study area were rated as follows (DWS, 2014 – where B = Largely Natural and C = Moderately Modified):

Subquaternary Catchment Number	Present Ecological State	Ecological Importance	Ecological Sensitivity
1630	B	Moderate	High
1710	B	Moderate	High
1678	C	High	Moderate
1693	C	High	High
1770	C	High	High

These scores were substantiated by observations made in the field within the study area, and due to the overall lack of impacts or disturbance these scores for each of the watercourses within the site should be upheld.

This was further substantiated by the inclusion of study area catchments into Critical Biodiversity Areas (Type 1 and 2), i.e. the wetland areas near the alignment crossing the Brak River in particular and Ecological Support Area as shown in the Mpumalanga CBA MAP spatial data and Wetland Clusters (Figure 8).

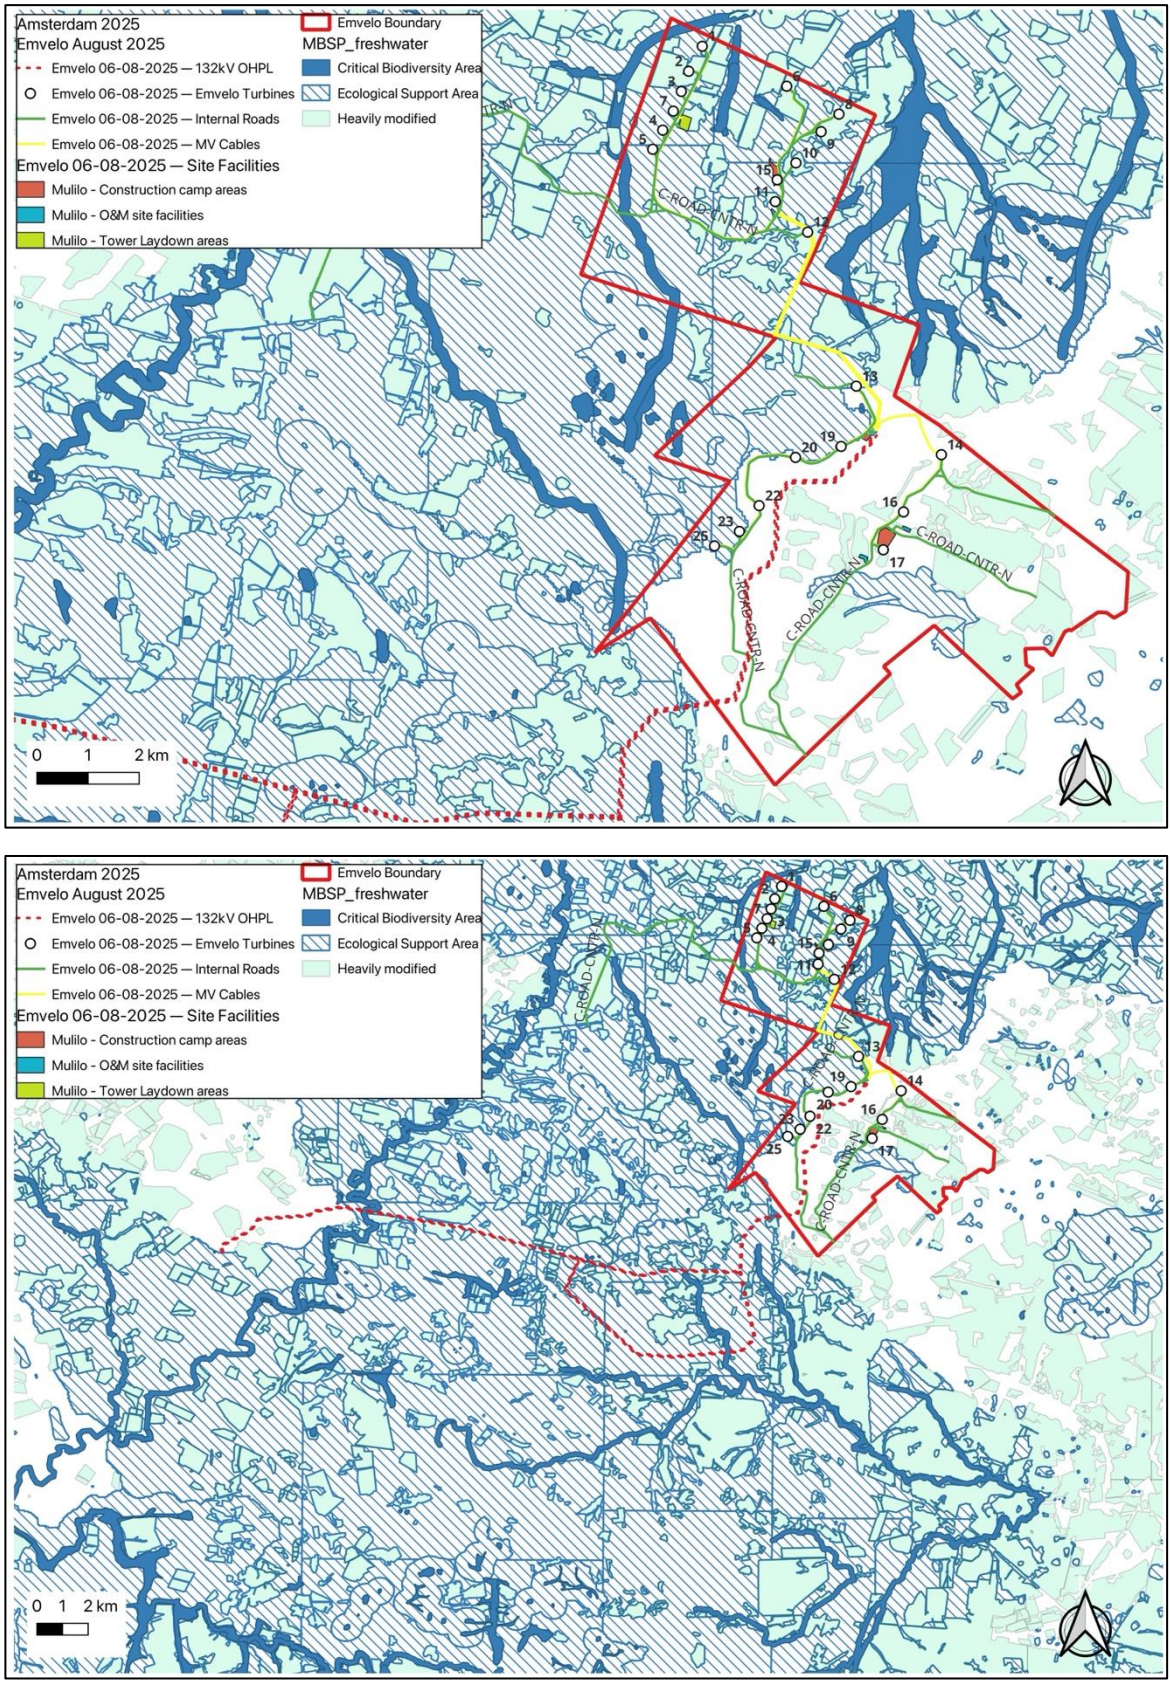

Figure 8: Critical Biodiversity Areas as per the Mpumalanga Biodiversity Spatial Plan, where the top map is for the project area and the bottom map is for the WEF

7. Permit requirements

Based on an assessment of the proposed activities and past engagement with DWS, the following WULs/ GA's could be required based on the following thresholds as listed in the following Government Notices, however ultimately the Department Water and Sanitation (DWS) will determine if a GA or full WULA will be required during the pre-application process (Phase 1):

	Water Use Activity	Applicable to this development proposal
S21(a)	Taking water from a water resource	Only water if water is abstracted from a local river or borehole
S21(b)	Storing water	If the total volume stored is greater than 40 000 m^3 then a full Water Use License will be required. This is however unlikely due to the scale of the project and the need for such large volumes.
S21(c)	Impeding or diverting the flow of water in a watercourse	Yes – several new crossings of watercourses (i.e. activities within 500m of a wetland or 100m of a watercourse will be required. A GA process can potentially be followed if Risk Assessment Matrix indicates all impacts are LOW.
S21(d)	Engaging in a stream flow reduction activity	Not applicable
S21(e)	Engaging in a controlled activity	Not applicable
S21(f)	Discharging waste or water containing waste into a water resource through a pipe, canal, sewer or other conduit	Not applicable
S21(g)	Disposing of waste in a manner which may detrimentally impact on a water resource	Not applicable – Only portable toilets will be required
S21(h)	Disposing in any manner of water which contains waste from, or which has been heated in, any industrial or power generation process	Not applicable
S21(i)	Altering the bed, banks, course or characteristics of a watercourse	Yes – several new crossings of watercourses (i.e. activities within 500m of a wetland or 100m of a watercourse will be required. A GA process can potentially be followed if Risk Assessment Matrix indicates all impacts are LOW.
S21(j)	Removing, discharging or disposing of water found underground for the continuation of an activity or for the safety of persons	Not applicable
S21(k)	Using water for recreational purposes	Not applicable

8. Sensitivity Assessment

Using the baseline description and field data while considering the current disturbances and site characteristics, the following features were identified, then categorised into one of number pre-determined sensitivity categories to provide protect and/or guide the layout planning:

High = No Go	"No go" areas or setbacks and areas or features that are considered of such significance that impacting them may be regarded as fatal flaw or strongly influence the project impact significance profile Therefore areas or features that are considered to have a high sensitivity or where project infrastructure would be highly constrained and should be avoided as far as possible. Infrastructure located in these areas are likely to drive up impact significance ratings and mitigations
Medium	Buffer areas and or areas that are deemed to be of medium sensitivity but should still be avoid as this would minimise impacts and or the need for additional Water Use Authorisation
Low	Areas of low sensitivity or constraints, such as artificial systems with little to no biological value or would not result in any future licensing requirements e.g. dry earth wall farm dams
Neutral	Unconstrained areas (left blank in mapping)

Table 4 below provides an overview of the sensitivity of various aquatic features (with buffers distances included) as it relates to the main project component types for the project. The features are shown spatially in Figure 7 above.

The sensitivity ratings of High No-go and Low were determined through an assessment of the aquatic habitat sensitivity and related constraints. However, these No-Go areas (with buffers) relate in general terms to the project and there are areas where encroachment on these areas would occur (i.e. existing road crossings within systems, but this is considered acceptable since these areas have already been impacted.

These proposed constraints / buffers do not include bird and or bat specialist buffers / constraints as theirs buffers along aquatic features are at times far larger around aquatic features, than those required for the known aquatic species within this region.

Table 4: Results of the sensitivity rating / constraints assessment

Development Component	Habitat type	Sensitivity rating of the respective habitat type against the development type	Buffer distance (m)	Development acceptability	Sensitivity rating override if an impact such as a road or other disturbance already occurs within the proposed footprint and confirmed by the specialist
WTG towers	Channelled Valley Bottom Wetlands	No-Go	105m	No WTGs should be placed in any of these areas, regardless of the state, type and functionality of the respective aquatic ecosystem	None
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		
Hardstands, Buildings / Substations & BESS	Channelled Valley Bottom Wetlands	No-Go	105m	None of these types of infrastructure should be placed in any of these areas	None
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		
Roads & Underground cables alignment roads	Channelled Valley Bottom Wetlands	High	105m	New roads and underground cables would not be deem appropriate within any of these areas, unless some form of disturbance already occurs, such as an existing track or bridge	Only existing tracks or disturbed areas maybe used
	Pans and Depressions		95m		
	Rivers and Floodplains				
	Seeps		65m		
	Minor watercourses		35m		
OHL	Channelled Valley Bottom Wetlands	High	105m	OHL towers must be placed outside of these area so that only the cables span these systems. The exception being that Pans & Depression inclusive of buffers must be avoided completely	
	Pans and Depressions		95m		
	Rivers and Floodplains		65m		
	Seeps		65m		
	Minor watercourses		35m		

9. Impact assessment

During the impact assessment several potential key issues / impacts were identified and these were assessed based on the methodology supplied by ERM.

9.1 Alternatives Assessment

The 2014 EIA Regulations require that any feasible and reasonable activity, location and technology alternatives considered must be described and comparatively assessed.

9.2 No-Go Option

With regard the No-Go option it is assumed that the site would continue to degrade due to the prevalence of grazing and or erosion within the water courses. This would continue into the long-term with a Low intensity that would impact on the regional scale due to loss of important habitat. Little in the way of mitigation could be proposed due to the social needs of the surrounding residents and or landowners, coupled to the need for access.

10. Potential aquatic ecosystems impacts

- Impact 1: Loss of habitat containing protected species or Species of Special Concern
- Impact 2: Loss of any critical corridors, important catchment areas and connected habitats that are linked to any Critical Biodiversity Areas or Ecological Support Areas
- Impact 3: The potential spread of alien vegetation
- Impact 4: Loss of riparian and or wetland habitat
- Impact 5: Changes to the hydrological regime and increased potential for erosion
- Impact 6: Changes to water quality
- Impact 7: Cumulative Impacts

The Tables 5 – 11 below assesses the impact significance for each impact. It was determined that the impacts upon aquatic biodiversity associated with the project are of Low significance, after mitigation. This assumes that the mitigations listed below are considered coupled to the fact that the overall layouts have avoid any of the High / No-Go areas, unless making use of areas with impacts such as existing farm roads. However, it is assumed that the final layout will orientate the hardstands, crane pads, blade laydowns and construction camps outside of any of the No-Go areas.

The loss of irreplaceable aquatic habitat and/or important aquatic obligate biota is therefore highly unlikely. The impacts are easily mitigated (provided the mitigation measures and monitoring plan within the EMP and this report are implemented and adhered to during all phases of the project).

Table 5: Impact assessment summary for Impact 1 – Loss of habitat containing protected species or Species of Special Concern

Impact Phase: Construction and Decommissioning					
Nature of the impact: Loss of vegetation and in particular species / habitats that could contain listed as Critically Endangered and or Vulnerable species (direct)					
Description of Impact: Activities resulting in physical disturbance of aquatic systems which provide ecosystem services, especially where new crossings are made, or large hard engineered surfaces are placed within the buffer zones. Loss can also include a functional loss, through change in vegetation type via alien encroachment, reducing aquatic biodiversity. However no aquatic vegetation with conservation concern were observed during this assessment, coupled to the fact that any sensitive areas will be avoided.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3
With Mitigation	Site	Short Term	Recoverable	Low	Low Probability
Score	1	2	3	1	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Moderate Negative Impact (39)			Low Negative Impact (14)	
Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					
Mitigation measures to reduce residual risk or enhance opportunities: • The development of the stormwater management plan and Aquatic Rehabilitation and Monitoring plan, coupled to confirmation of the final layout prior to construction is made by the aquatic specialist. • Where large cut and fill areas are required, these must be stabilised and rehabilitated during the construction process, to minimise erosion and sedimentation. • Suitable stormwater management systems must be installed along roads and other areas and monitored during the first few months of use. Any erosion / sedimentation must be resolved through whatever additional interventions maybe necessary (i.e., extension, energy dissipaters, spreaders, etc). To minimise the impact of the access roads: • Use existing roads or upgrade existing tracks rather than constructing entirely new roads wherever possible and has been included in the proposed layout.					

- Use the smallest possible working corridor. Outside the working corridor, all watercourses are to be considered no go areas. Where intrusion is required, the working corridor must be kept to a minimum and demarcated clearly before any construction commences.
- Removal of vegetation must only be when essential for the continuation of the project. Do not allow any disturbance to the adjoining natural vegetation cover or soils.
- Where required, all pipe culverts must be removed and replaced with suitable sized box culverts, where road levels are raised. Crossings that are installed below the natural ground level are to be constructed with an appropriate drop inlet structure on the upstream side to ensure that head cut erosion does not develop because of the gradient change from the natural ground level to the invert level of the culvert.
- The channel profile, regardless of the current state of the river / water course, will be reinstated thus preventing any impoundments from being formed. The related designs must be assessed by an aquatic specialist, with a preference for low level drifts where possible.
- Water diversions must be temporary in nature and no permanent walls, berms or dams may be installed within a watercourse. Sandbags used in any diversion or for any other activity within a watercourse must be in a good condition, so that they do not burst and empty sediment into the watercourse. Upon completion of the construction at the site, the diversions shall be removed to restore natural flow patterns. Under no circumstance shall a new channel or drainage canals be excavated to divert water away from construction activities.
- Any fauna (frogs, snakes, etc.) that are found within the construction area must be moved to the closest point of similar habitat type outside of the areas to be impacted.
- All disturbed areas beyond the construction site that are intentionally or accidentally disturbed during the construction phase must be rehabilitated.

It is the contractor's responsibility to continuously monitor the area for newly established alien species during the contract and establishment period, which if present must be removed. Removal of these species shall be undertaken in a way which prevents any damage to the remaining indigenous species and inhibits the re-infestation of the cleaned areas.

Table 6: Impact assessment summary for Impact 2 – Loss of CBAs or potential areas with conservation potential or linked to any important catchments and strategic water resource areas

Impact Phase: Construction and Decommissioning					
Nature of the impact: Loss of any critical corridors and connect habitats that are linked to any future conservation plans (direct) is not expected as these can been avoided, coupled to the fact that hydrological connections will be retained through avoidance or the inclusion of ecological buffers.					
Description of Impact: Activities resulting in physical disturbance of aquatic systems which provide ecosystem services, especially where new crossings are made, or large hard engineered surfaces are placed within the buffer zones and have been included in any Critical Biodiversity Areas. it is assumed that the final layout will orientate the hardstands, crane pads, blade laydowns and construction camps outside of any of the No-Go areas.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable

Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					
Mitigation measures to reduce residual risk or enhance opportunities: • The aquatic systems have been mapped to a finer scale and have taken cognizance of any potential CBAs. As High / No-Go have been avoided by the major infrastructure such as turbines, the aquatic zones associated within the CBA / ESAs have also been avoided. Roads will need to traverse these areas, thus it is important to try and select existing areas with impacts / crossings where possible, coupled to the assumptions above • The development of the stormwater management plan and Aquatic Rehabilitation and Monitoring plan, coupled to confirmation of the final layout prior to construction is made by the aquatic specialist. • Where large cut and fill areas are required, these must be stabilised and rehabilitated during the construction process, to minimise erosion and sedimentation. • Suitable stormwater management systems must be installed along roads and other areas and monitored during the first few months of use. Any erosion / sedimentation must be resolved through whatever additional interventions maybe necessary (i.e., extension, energy dissipaters, spreaders, etc). To minimise the impact of the access roads: • Use existing roads or upgrade existing tracks rather than constructing entirely new roads wherever possible and has been included in the proposed layout. • Use the smallest possible working corridor. Outside the working corridor, all watercourses are to be considered no go areas. Where intrusion is required, the working corridor must be kept to a minimum and demarcated clearly, before any construction commences.					

• Removal of vegetation must only be when essential for the continuation of the project. Do not allow any disturbance to the adjoining natural vegetation cover or soils. • Where required, all pipe culverts must be removed and replaced with suitable sized box culverts, where road levels are raised. Crossings that are installed below the natural ground level are to be constructed with an appropriate drop inlet structure on the upstream side to ensure that head cut erosion does not develop as a result of the gradient change from the natural ground level to the invert level of the culvert. • The channel profile, regardless of the current state of the river / water course, will be reinstated thus preventing any impoundments from being formed. The related designs must be assessed by an aquatic specialist, with a preference for low level drifts where possible. • Water diversions must be temporary in nature and no permanent walls, berms or dams may be installed within a watercourse. Sandbags used in any diversion or for any other activity within a watercourse must be in a good condition, so that they do not burst and empty sediment into the watercourse. Upon completion of the construction at the site, the diversions shall be removed to restore natural flow patterns. Under no circumstance shall a new channel or drainage canals be excavated to divert water away from construction activities. • Any fauna (frogs, snakes, etc.) that are found within the construction area must be moved to the closest point of similar habitat type outside of the areas to be impacted. • All disturbed areas beyond the construction site that are intentionally or accidentally disturbed during the construction phase must be rehabilitated. It is the contractor's responsibility to continuously monitor the area for newly established alien species during the contract and establishment period, which if present must be removed. Removal of these species shall be undertaken in a way which prevents any damage to the remaining indigenous species and inhibits the re-infestation of the cleaned areas.	
Residual impact	Very low and acceptable with adoption of mitigation measures

Table 7: Impact assessment summary for Impact 3 – Potential spread of alien vegetation

Impact Phase: Construction and Operation					
Nature of the impact: Any physical disturbance could result in the spread of alien vegetation (direct)					
Description of Impact: During construction, complete clearing of the roads and turbine areas, as well any ancillary structures (offices and substations) will be required. This disturbance then allows for the alien species to colonise the soils, if left unmanaged.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3
With Mitigation	Site	Short Term	Recoverable	Low	Low Probability
Score	1	2	3	1	2

Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					

Mitigation measures to reduce residual risk or enhance opportunities: • Alien vegetation management must be initiated at the beginning of the construction period and must extend into any remaining areas into the operation phase on the facility • The revegetation of any temporary sites as well as any previously degraded areas must begin from the onset of the project, with the involvement of a botanist to assist with the revegetation specifications Regeneration of alien vegetation must be monitored once all areas have been cleared, forming part of a long-term alien vegetation management plan	
Residual impact	Very low and acceptable, with adoption of mitigation measures and monitoring

Table 8: Impact assessment summary for Impact 4 – Loss of riparian and or wetland habitat

Impact Phase: Construction and Decommissioning					
Nature of the impact: It was recommended that all wetlands / riverine systems as well as the inclusive of buffers, be avoided. it is assumed that the final layout will orientate the hardstands, crane pads, blade laydowns and construction camps outside of any of the No-Go areas.					
Description of Impact: During construction, complete clearing of the roads and turbine areas, as well any ancillary structures (offices and substations) will be required, which may impact the aquatic function or any corridors or connections between aquatic systems. However, all Very High Sensitivity / No-Go areas have been avoided by the proposed layout by also making use of existing road crossings or considering any of the proposed buffers.					
Impact Status: Negative

Removal of these species shall be undertaken in a way which prevents any damage to the remaining indigenous species and inhibits the re-infestation of the cleaned areas.	
Residual impact	Very low and acceptable with adoption of mitigation measures

Table 9: Impact assessment summary for Impact 5 – Changes to the hydrological regime and increase potential for erosion

Impact Phase: Construction and Decommissioning					
Nature of the impact: Increased hard surfaces can result in increases in runoff generated by the site, thereby resulting in changes to localised hydrological regimes.					
Description of Impact: During construction, complete clearing of the roads and turbine areas, as well any ancillary structures (offices and substations) will be required, which may impact the aquatic function or any corridors or connections between aquatic systems. However, these areas must be by the proposed layout by also making use of existing road crossings or by considering any of the proposed buffers.					
Impact Status: Negative					
	E	D	R	M	P

With Mitigation	Site	Short Term	Recoverable	Low	Low Probability

Score	1	2	3	1	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Moderate Negative Impact (39)			Low Negative Impact (14)	
Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					

Mitigation measures to reduce residual risk or enhance opportunities:

- No stormwater discharged may be directed to delineated aquatic zones or the associated buffers.
- A stormwater management plan finalised prior to construction, detailing the structures and actions that must be installed to prevent the increase of surface water flows directly into any natural systems.
- Effective stormwater management must include measures to slow, spread and deplete the energy of concentrated flows thorough effective stabilisation (gabions and Reno mattresses) and the re-vegetation of any disturbed areas

To minimise the impact of the access roads:

- Use existing roads or upgrade existing tracks rather than constructing entirely new roads wherever possible and has been included in the proposed layout.
- Use the smallest possible working corridor. Outside the working corridor, all watercourses are to be considered no go areas.. Where intrusion is required, the working corridor must be kept to a minimum and demarcated clearly, before any construction commences.
- Removal of vegetation must only be when essential for the continuation of the project. Do not allow any disturbance to the adjoining natural vegetation cover or soils.
- Where required, all pipe culverts must be removed and replaced with suitable sized box culverts, where road levels are raised. Crossings that are installed below the natural ground level are to be constructed with an appropriate drop inlet structure on the upstream side to ensure that head cut erosion does not develop as a result of the gradient change from the natural ground level to the invert level of the culvert.
- The channel profile, regardless of the current state of the river / water course, will be reinstated thus preventing any impoundments from being formed. The related designs must be assessed by an aquatic specialist, with a preference for low level drifts where possible.
- Water diversions must be temporary in nature and no permanent walls, berms or dams may be installed within a watercourse. Sandbags used in any diversion or for any other activity within a watercourse must be in a good condition, so that they do not burst and empty sediment into the watercourse. Upon completion of the construction at the site, the diversions shall be removed to restore natural flow patterns. Under no circumstance shall a new channel or drainage canals be excavated to divert water away from construction activities.
- Any fauna (frogs, snakes, etc.) that are found within the construction area must be moved to the closest point of similar habitat type outside of the areas to be impacted.
- All disturbed areas beyond the construction site that are intentionally or accidentally disturbed during the construction phase must be rehabilitated.

It is the contractor's responsibility to continuously monitor the area for newly established alien species during the contract and establishment period, which if present must be removed. Removal of these species shall be undertaken in a way which prevents any damage to the remaining indigenous species and inhibits the re-infestation of the cleaned areas.

Residual impact	Very low and acceptable with adoption of mitigation measures

Table 10: Impact assessment summary for Impact 6 –Changes to surface water quality characteristics

Impact Phase: Construction and Decommissioning					
Nature of the impact: Potential impact on localised surface water quality (indirect)					
Description of Impact: During construction or decommissioning, earthworks will expose and mobilise earth materials, and a number of materials as well as chemicals will be imported and used on site and may end up in the surface water, including soaps, oils, grease and fuels, human wastes, cementitious wastes, paints and solvents, etc. Any spills during transport or while works area conducted in proximity to a watercourse has the potential to affect the surrounding biota. This can result in possible deterioration in aquatic ecosystem integrity and species diversity.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3

Was public comment received? Not yet					
Has public comment been included in mitigation measures? Note still in the draft phase and that comment will be obtained during the NEMA comment periods					
Mitigation measures to reduce residual risk or enhance opportunities: • All liquid chemicals including fuels and oil, including for the BESS, must be stored in with secondary containment (bunds or containers or berms) that can contain a leak or spill. Such facilities must be inspected routinely and must have the suitable PPE and spill kits needed to contain likely worst-case scenario leak or spill in that facility, safely. • Washing and cleaning of equipment must be done in designated wash bays, where rinse water is contained in evaporation/sedimentation ponds (to capture oils, grease cement and sediment). • Mechanical plant and bowsers must not be refueled or serviced within 100m of a river channel or wetland. • All construction camps, lay down areas, wash bays, batching plants or areas and any stores should be beyond any demarcated water courses and their respective buffers. • Littering and contamination associated with construction activity must be avoided through effective construction camp management. • No stockpiling should take place within or near a water course. • All stockpiles must be protected and located in flat areas where run-off will be minimised and sediment recoverable.					

ECO monitors the site on a daily basis to ensure plant is in working order (minimise leaks), spills are prevented and if they do occur, are quickly rectified.	
Residual impact	Low risk and acceptable, with adoption of mitigation measures and monitoring

Table 11: Impact assessment summary for Impact 7 - Cumulative impact assessment for aquatic biodiversity

Cumulative Impact: Cumulative impacts on the aquatic resources of the area
