Description of Cumulative Impact: The cumulative impact assessment considers the combined impact of the remaining and other renewable projects within a 30km radius, that are also in the development phase and the associated grid lines on the aquatic resources. The rating below is based on the premise that important or sensitive features will be avoided by the various projects, while the mitigations proposed will ensure that the form and or function of downstream areas remain intact.					
Impact Status: Negative					
	E	D	R	M	P
Without Mitigation	Local	Long Term	Irreversible	Medium	Probable
Score	2	4	5	2	3
With Mitigation	Site	Short Term	Recoverable	Low	Low Probability
Score	1	2	3	1	2
Significance Calculation	Without Mitigation			With Mitigation	
S=(E+D+R+M)*P	Moderate Negative Impact (39)			Low Negative Impact (14)	
Can Impacts be Enhanced?	No				
Enhancement: The project should share roads and infrastructure where possible to reduce the overall footprint and reduce stormwater and erosion and sedimentation related impacts The projects should collaborate with provincial roads authority to upgrade the main access routes and improve the crossings and stormwater controls					
Residual impact	Low				

11. Draft Specialists Recommendations for the EA

The DFFE Screening Tool identified two sensitivity ratings within the development footprint, namely, Low and Very High. There is overlap with the findings on site and the Screening Tool's outcome, thus the development footprint must be developed with cognisance of these sensitivities.

Therefore, environmental sensitivity input received from the aquatic ecology specialist was taken forward and considered within the EIA process and the impact to these areas assessed. Appropriate layout and development restrictions were implemented within the development footprint to ensure that the impact to aquatic ecology is deemed acceptable by the aquatic ecologist. However, it is assumed that the final layout will orientate the hardstands, crane pads, blade laydowns outside of any of the No-Go areas.

The specialist has no objection to the authorisation of the proposed activities assuming that all mitigations and buffer zones are implemented.

Mitigation should focus on these areas and include measures to halt erosion and rehabilitate habitat in the sections affected by the construction. Without the implementation of mitigation measures, the project has potential to cause a Low cumulative impact upon aquatic biodiversity. However, with the adoption of mitigation, the proposed project will have a Very Low impact upon aquatic biodiversity.

12. Monitoring and Management Actions

The following are key recommendations, which are also critical to the proposed mitigations:

- Any of the activities, should also be monitored by the appointed Environmental Officer /Environmental Control Officer (EO/ECO) on a daily basis, especially during periods of river flow during construction.
- Any points of erosion should be stabilised immediately (sand bags in the short term) using gabions and reno mattress as required. No activities should take place outside of the demarcated servitude, to prevent additional cumulative impacts on these systems.
- The EMPr, must include a Construction Specific Monitoring and Rehabilitation Plan related to the water course and wetland crossings, and specifically to the prevention of erosion and sedimentation as these systems are prone to scour, with rehabilitation options being limited due to the sparse nature of the vegetation.
- Monitoring should occur on a monthly basis for 6 months post construction and where any unstable soils occur, these must be protected with temporary stabilisation dependent on the scale of the impact i.e. sand bags - hay bales) until areas become revegetated. If any areas require permanent erosion protection (e.g. gabions or stone pitching) then the WULA/GA must be amended to include these areas.

13.Conclusion and Recommendations

During this assessment, several sensitive aquatic habitats were observed and are shown in the maps provided in this report. Noteworthy areas, were then avoided by the required infrastructure, and include the main riverine and wetland systems, while the access roads could will make use of existing roads thus previously disturbed areas.

If this is carried out, then the specialist has no objection to the authorisation of the proposed activities assuming that all mitigations and buffer zones are implemented.

Mitigation should focus on these areas and include measures to halt erosion and rehabilitate habitat in the sections affected by the construction. Without the implementation of mitigation measures, the project has potential to cause a Moderate cumulative impact upon aquatic biodiversity. However, with the adoption of mitigation, the proposed project will have a Low impact upon aquatic biodiversity.

As the proposed activities have the potential to create erosion the following recommendations are reiterated:

- Vegetation clearing should occur in a phased manner in accordance with the construction programme to minimise erosion and/or run-off. Large tracts of bare soil will either cause dust pollution or quickly erode and then cause sedimentation in the lower portions of the catchment, and suitable dust and erosion control mitigation measures should be included in the generic EMPr, if not included already to mitigate.
- All construction materials including fuels and oil should be stored in demarcated areas that are contained within berms / bunds to avoid spread of any contamination / leaks. Washing and cleaning of equipment should also be done in berms or bunds, to trap any cement / hazardous substances and prevent excessive soil erosion. Mechanical plant and bowsers must not be refuelled or serviced within or directly adjacent to any channel. It is therefore suggested that all construction camps, lay down areas, batching plants or areas and any stores should be located more than 50 m from any demarcated watercourses.

- It is also advised that an Environmental Control Officer (ECO), with a good understanding of the local flora be appointed during the construction phase. The ECO should be able to make clear recommendations with regards to the re-vegetation of the newly completed / disturbed areas along aquatic features, using selected species detailed in this report.
- All alien plant re-growth must be monitored and should these alien plants reoccur these plants should be re-eradicated. The scale of the operation does however not warrant the use of a Landscape Architect and / or Landscape Contractor.

It is further recommended from the project onset that all watercourse areas (inclusive of buffers) are included into any existing EMPr as reference, this to ensure a net benefit to the aquatic environment. This should from part of the suggested walk down as part of the final EMP preparation.

CURRICULUM VITAE
Dr Brian Michael Colloty

1 Rossini Rd
Pari Park
Port Elizabeth, 6070
b.colloty@gmail.com

Profession: Ecologist & Environmental Assessment Practitioner (Pr. Sci. Nat. 400268/07)
Member of the South African Wetland Society
Specialisation: Ecology and conservation importance rating of terrestrial habitats, wetlands, rivers & estuaries
Years experience: 25 years

SKILLS BASE AND CORE COMPETENCIES

- 25 years experience in environmental sensitivity and conservation assessment of aquatic and terrestrial systems inclusive of Index of Habitat Integrity (IHI), WET Tools, Riparian Vegetation Response Assessment Index (VEGRAI) for Reserve Determinations, estuarine and wetland delineation throughout Africa. Experience also includes biodiversity and ecological assessments with regard sensitive fauna and flora, within the marine, coastal and inland environments. Countries include Mozambique, Kenya, Namibia, Central African Republic, Zambia, Eritrea, Mauritius, Madagascar, Angola, Ghana, Guinea-Bissau and Sierra Leone. Current projects also span all nine provinces in South Africa.
- 15 years experience in the coordination and management of multi-disciplinary teams, such as specialist teams for small to large scale EIAs and environmental monitoring programmes, throughout Africa and inclusive of marine, coastal and inland systems. This includes project and budget management, specialist team management, client and stakeholder engagement and project reporting.
- GIS mapping and sensitivity analysis

TERTIARY EDUCATION

- 1994: B Sc Degree (Botany & Zoology) - NMU
- 1995: B Sc Hon (Zoology) - NMU
- 1996: M Sc (Botany - Rivers) - NMU
- 2000: Ph D (Botany – Estuaries & Mangroves) – NMU

EMPLOYMENT HISTORY

- 1996 – 2000 Researcher at Nelson Mandela University – SAB institute for Coastal Research & Management. Funded by the WRC to develop estuarine importance rating methods for South African Estuaries
- 2001 – January 2003 Training development officer AVK SA (reason for leaving – sought work back in the environmental field rather than engineering sector)
- February 2003- June 2005 Project manager & Ecologist for Strategic Environmental Focus (Pretoria) – (reason for leaving – sought work related more to experience in the coastal environment)
- July 2005 – June 2009 Principal Environmental Consultant Coastal & Environmental Services (reason for leaving – company restructuring)
- June 2009 – August 2018 Owner / Ecologist of Scherman Colloty & Associates cc
- August 2018 Owner / Ecologist - EnviroSci (Pty) Ltd

SELECTED RELEVANT PROJECT EXPERIENCE

World Bank IFC Standards

- Kenmare Mining Pilivilli, Mozambique - wetland (mangroves, peatlands and estuarine) assessment and biodiversity offset analysis - current
- Botswana South Africa 400kv transmission line (400km) biodiversity assessment on behalf of Aurecon - current
- Farim phosphate mine and port development, Guinea Bissau – biodiversity and estuarine assessment on behalf of Knight Piesold Canada – 2016.
- Tema LNG offshore pipeline EIA – marine and estuarine assessment for Quantum Power (2015).
- Colluli Potash South Boulder, Eritrea, SEIA marine baseline and hydrodynamic surveys co-ordinator and coastal vegetation specialist (coastal lagoon and marine) (on-going).
- Wetland, estuarine and riverine assessment for Addax Biofeuls Sierra Leone, Makeni for Coastal & Environmental Services: 2009
- ESHIA Project manager and long-term marine monitoring phase coordinator with regards the dredge works required in Luanda bay, Angola. Monitoring included water quality and biological changes in the bay and at the offshore disposal outfall site, 2005-2011

South African

- Plant and animal search and rescue for the Karusa, Soetwater, Nxuba, Oyster Bay and Garob Wind Farms on behalf of Enel Green Power, 2018 - 2019
- Plant and Animal Search and Rescue for the Port of Ngqura, Transnet Landside infrastructure Project, with development and management of on site nursery (Current).
- Plant and Animal Search and Rescue for the Port of Ngqura, OTGC Tank Farm Project (2019)
- Plant search and rescue, for NMBM (Driftsands sewer, Glen Hurd Drive), Department of Social Development (Military veterans housing, Despatch) and Nxuba Wind Farm, - current
- Wetland specialist appointed to update the Eastern Cape Biodiversity Conservation Plan, for the Province on behalf of EOH CES appointment by SANBI – current. This includes updating the National Wetland Inventory for the province, submitting the new data to CSIR/SANBI.
- CDC IDZ Alien eradication plans for three renewable projects Coega Wind Farm, Sonop Wind Farm and Coega PV, on behalf of JG Afrika (2016 – 2017).
- Nelson Mandela Bay Municipality Baakens River Integrated Wetland Assessment (Inclusive of Rehabilitation and Monitoring Plans) for CEN IEM Unit - Current
- Rangers Biomass Gasification Project (Uitenhage), biodiversity and wetland assessment and wetland rehabilitation / monitoring plans for CEM IEM Unit – current.
- Gibson Bay Wind Farm implementation of the wetland management plan during the construction and operation of the wind farm (includes surface / groundwater as well wetland rehabilitation & monitoring plan) on behalf of Enel Green Power - current
- Gibson Bay Wind Farm 133kV Transmission Line wetland management plan during the construction of the transmission line (includes wetland rehabilitation & monitoring plan) on behalf of Eskom – 2016.
- Tsitsikamma Community Wind Farm implementation of the wetland management plan during the construction of the wind farm (includes surface / biomonitoring, as well wetland rehabilitation & monitoring plan) on behalf of Cennergi – completed May 2016.
- Alicedale bulk sewer pipeline for Cacadu District, wetland and water quality assessment, 2016
- Mogalakwena 33kv transmission line in the Limpopo Province, on behlaf of Aurecon, 2016
- Cape St Francis WWTW expansion wetland and passive treatment system for the Kouga Municipality, 2015
- Macindane bulk water and sewer pipelines wetland and wetland rehabilitation plan 2015
- Eskom Prieska to Copperton 132kV transmission line aquatic assessment, Northern Cape on behalf of Savannah Environmental 2015.
- Joe Slovo sewer pipeline upgrade wetland assessment for Nelson Mandela Bay Municipality 2014
- Cape Recife Waste Water Treatment Works expansion and pipeline aquatic assessment for Nelson Mandela Bay Municipality 2013
- Pola park bulk sewer line upgrade aquatic assessment for Nelson Mandela Bay Municipality 2013
- Transnet Freight Rail – Swazi Rail Link (Current) wetland and ecological assessment on behalf of Aurecon for the proposed rail upgrade from Ermelo to Richards Bay
- Eskom Transmission wetland and ecological assessment for the proposed transmission line between Pietermaritzburg and Richards Bay on behalf of Aurecon (2012).
- Port Durnford Exarro Sands biodiversity assessment for the proposed mineral sands mine on behalf of Exxaro (2009)
- Fairbreeze Mine Exxaro (Mtunzini) wetland assessment on behalf of Strategic Environmental Services (2007).
- Wetland assessment for Richards Bay Minerals (2013) – Zulti North haul road on behalf of RBM.
- Biodiversity and aquatic assessments for 101 renewable projects in the past 8 years in the Western, Eastern, Northern Cape, KwaZulu-Natal and Free State provinces. Clients included RES-SA, Red Cap, ACED Renewables, Mainstream Renewable, GDF Suez, Globeleq, ENEL, Abengoa amongst others. Particular aquatic sensitivity assessment and Water Use License Applications on behalf of Mainstream Renewable Energy (8 wind farms and 3 PV facilities.), Cennergi / Exxaro (2 Wind farms), WKN Wind current (2 wind farms & 2 PV facilities), ACED (6 wind farms) and Windlab (3 Wind farms) were also conducted. Several of these projects also required the assessment of the proposed transmission lines and switching stations, which were conducted on behalf of Eskom.
- Vegetation assessments on the Great Brak rivers for Department of Water and Sanitation, 2006 and the Gouritz Water Management Area (2014)
- Proposed FibreCo fibre optic cable vegetation assessment along the PE to George, George to Graaf Reinet, PE to Colesburg, and East London to Bloemfontein on behalf of SRK (2013-2015).

15.Appendix 2 - Site Sensitivity Verification Report

Site verification report – Aquatic Ecology

Government Notice No. 645, dated 10 May 2019, includes the requirement that an Initial Site Sensitivity Verification Report must be produced for a development footprint. As per Part 1, Section 2.3, the outcome of the Initial Site Verification must be recorded in the form of a report that-

(a) Confirms or disputes the current use of the land and environmental sensitivity as identified by the national web based environmental screening tool;
(b) Contains a motivation and evidence of either the verified or different use of the land and environmental sensitivity;
(c) Is submitted together with the relevant reports prepared in accordance with the requirements of the Environmental Impact Assessment Regulations.

This report has been produced specifically to consider the aquatic ecology theme and addresses the content requirements of (a) and (b) above. The report will be appended to the respective specialist study included in the Basic Assessment Report produced for the project.

Site sensitivity based on the aquatic biodiversity theme included in the Screening Tool and specialist assessment

Based on the DFFE Screening Tool, the WEF and Grid Connection falls within areas of very high sensitivity (Figure 1).

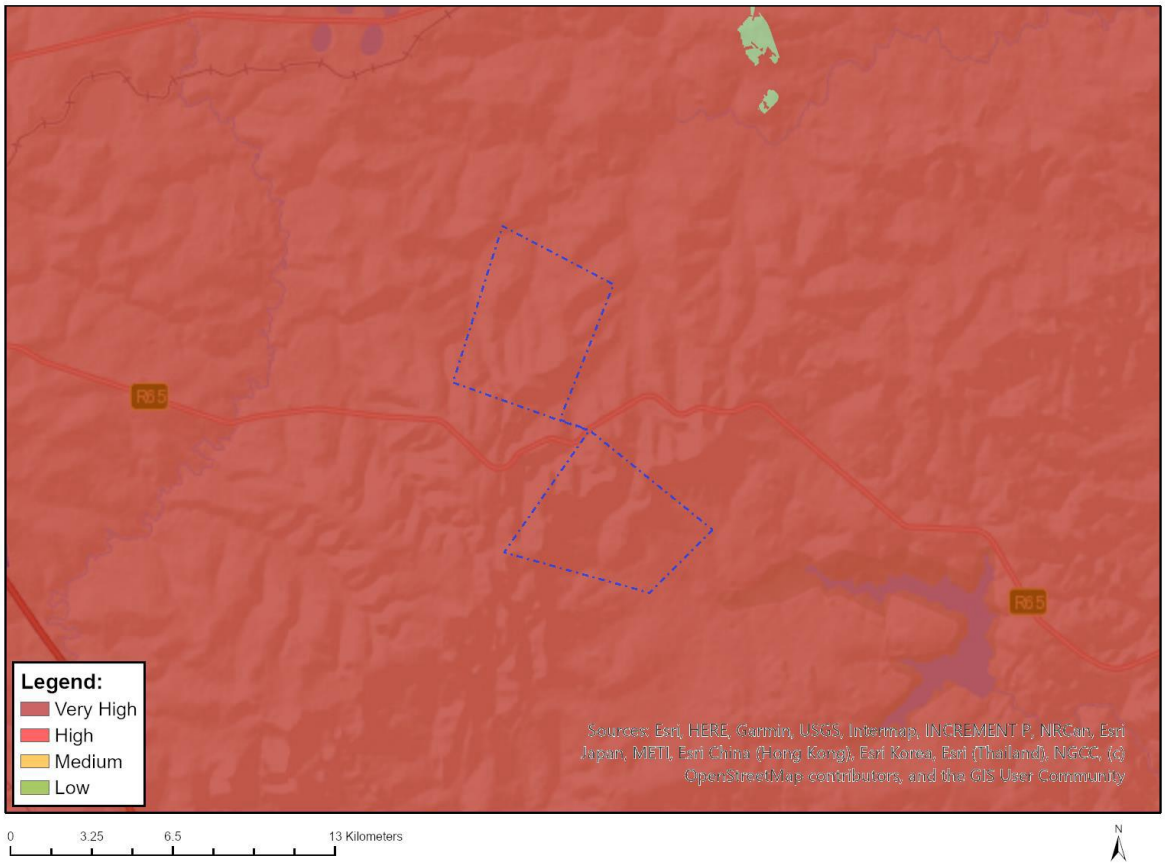

Figure 1a. DFFE Screening Tool outcome for the aquatic biodiversity theme for the WEF site

Figure 1b. DFFE Screening Tool outcome for the aquatic biodiversity theme for the Preferred Grid option

Based on the above outcomes, the specialist agrees the environmental sensitivities identified on site. However, disputes the exact extent of the systems, as the Screening Tool shows a catchment wide representation of the aquatic waterbodies that were rated as sensitive.

The specialist findings were informed by a site visits undertaken by Dr Brian Colloty over the course of several years. This information was then compared to current wetland inventories, 1: 50 000 topocadastral surveys mapping and the site. A baseline map was then developed which was refined, noting that due to the complex of the topography and geology, some of the river lines were digitised at a scale of 1:2000.

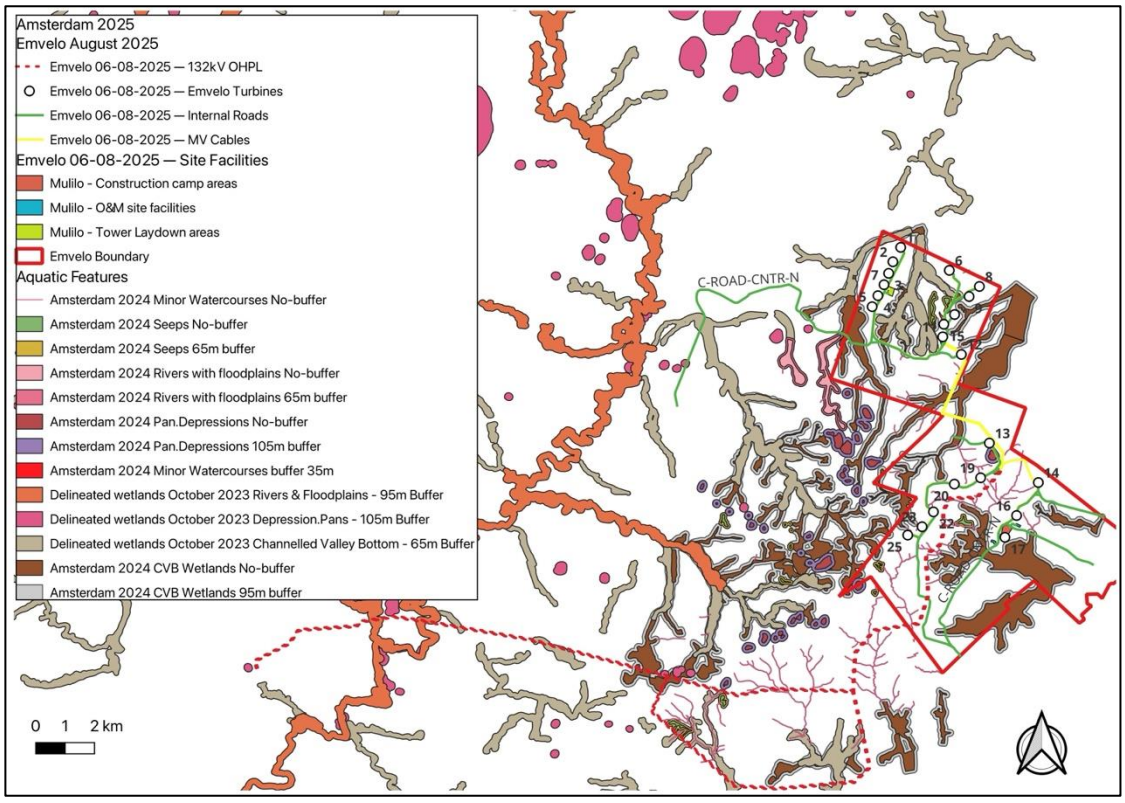

Figure 2. Environmental sensitivity map produced by the aquatic specialist

Motivation of the outcomes of the sensitivity map and key conclusions

In conclusion, the DFFE Screening Tool identified one sensitivity rating within the development footprint, namely, Very High.

Although there is some overlap with the findings on site and the Screening Tool's outcome, the development footprint contains various sensitivities (Very High and Low) that were identified following the undertaking of several site visits and spatial input considerations.

The environmental sensitivity input received from the aquatic ecology specialist wase taken forward and considered within the formal EA process and the impact to these areas assessed. Appropriate layout and development restrictions were implemented within the development footprint to ensure that the impact to aquatic ecology is deemed acceptable by the aquatic ecologist.

16. Appendix 3: Compliance with the Aquatic Biodiversity Protocol (GN 320, 20 March 2020)

Protocol for the Specialist Assessment and Minimum Report Content Requirements for Environmental Impacts on Aquatic Biodiversity	*Section where this has been addressed in the Specialist Report*
2.3. The assessment must provide a baseline description of the site which includes, as a minimum, the following aspects: *2.3.1. a description of the aquatic biodiversity and ecosystems on the site, including;* *a) aquatic ecosystem types; and* *b) presence of aquatic species, and composition of aquatic species communities, their habitat, distribution, and movement patterns;*	*Section 5 & 6 of this report*
2.3.2. the threat status of the ecosystem and species as identified by the screening tool;	*Section 5 & 6 of this report*
2.3.3. an indication of the national and provincial priority status of the aquatic ecosystem, including a description of the criteria for the given status (i.e., if the site includes a wetland or a river freshwater ecosystem priority area or sub catchment, a strategic water source area, a priority estuary, whether or not they are free -flowing rivers, wetland clusters, a critical biodiversity or ecologically sensitivity area); and	*Section 5 & 6 of this report*
2.3.4. a description of the ecological importance and sensitivity of the aquatic ecosystem including: *a) the description (spatially, if possible) of the ecosystem processes that operate in relation to the aquatic ecosystems on and immediately adjacent to the site (e.g., movement of surface and subsurface water, recharge, discharge, sediment transport, etc.); and* *b) the historic ecological condition (reference) as well as present ecological state of rivers (in- stream, riparian, and floodplain habitat), wetlands and/or estuaries in terms of possible changes to the channel and flow regime (surface and groundwater).*	*Section 5 & 6 of this report*
2.4. The assessment must identify alternative development footprints within the preferred site which would be of a "low" sensitivity as identified by the screening tool and verified through the site sensitivity verification and which were not considered appropriate.	*Section 9 of this report*
2.5. Related to impacts, a detailed assessment of the potential impacts of the proposed development on the following aspects must be undertaken to answer the following questions: *2.5.1. Is the proposed development consistent with maintaining the priority aquatic ecosystem in its current state and according to the stated goal?* *2.5.2. Is the proposed development consistent with maintaining the resource quality objectives for the aquatic ecosystems present?* *2.5.3. How will the proposed development impact on fixed and dynamic ecological processes that operate within or across the site? This must include:* *a) impacts on hydrological functioning at a landscape level and across the site which can arise from changes to flood regimes (e.g., suppression of floods, loss of flood attenuation*	*Section 9 of this report*

Protocol for the Specialist Assessment and Minimum Report Content Requirements for Environmental Impacts on Aquatic Biodiversity	*Section where this has been addressed in the Specialist Report*
capacity, unseasonal flooding or destruction of floodplain processes); *b) will the proposed development change the sediment regime of the aquatic ecosystem and its sub -catchment (e.g. sand movement, meandering river mouth or estuary, flooding or sedimentation patterns);* *c) what will the extent of the modification in relation to the overall aquatic ecosystem be (e.g., at the source, upstream or downstream portion, in the temporary I seasonal I permanent zone of a wetland, in the riparian zone or within the channel of a watercourse, etc.); and* *d) to what extent will the risks associated with water uses and related activities change;*	
2.5.4. how will the proposed development impact on the functioning of the aquatic feature? This must include: *a) base flows (e.g., too little or too much water in terms of characteristics and requirements of the system);* *b) quantity of water including change in the hydrological regime or hydroperiod of the aquatic ecosystem (e.g., seasonal to temporary or permanent; impact of over - abstraction or instream or off stream impoundment of a wetland or river);* *c) change in the hydrogeomorphic typing of the aquatic ecosystem (e.g., change from an unchannelled valley-bottom wetland to a channelled valley -bottom wetland);* *d) quality of water (e.g., due to increased sediment load, contamination by chemical and/or organic effluent, and/or eutrophication);* *e) fragmentation (e.g., road or pipeline crossing a wetland) and loss of ecological connectivity (lateral and longitudinal); and* *f) the loss or degradation of all or part of any unique or important features associated with or within the aquatic ecosystem (e.g., waterfalls, springs, oxbow lakes, meandering or braided channels, peat soils, etc.);*	*Section 9 of this report*
2.5.5. how will the proposed development impact on key ecosystems regulating and supporting services especially: *a) flood attenuation;* *b) streamflow regulation;* *c) sediment trapping;* *d) phosphate assimilation;* *e) nitrate assimilation;* *f) toxicant assimilation;* *g) erosion control; and* *h) carbon storage?*	*Section 9 of this report*
2.5.6. how will the proposed development impact community composition (numbers and density of species) and integrity (condition, viability, predator - prey ratios, dispersal rates, etc.) of the faunal and vegetation communities inhabiting the site?	*Section 9 of this report*
2.6. In addition to the above, where applicable, impacts to the frequency of estuary mouth closure should be considered, in relation to:	*N/A*

Protocol for the Specialist Assessment and Minimum Report Content Requirements for Environmental Impacts on Aquatic Biodiversity	*Section where this has been addressed in the Specialist Report*
a) size of the estuary; *b) availability of sediment;* *c) wave action in the mouth;* *d) protection of the mouth;* *e) beach slope;* *f) volume of mean annual runoff; and* *g) extent of saline intrusion (especially relevant to permanently open systems).*	
2.7. The findings of the specialist assessment must be written up in an Aquatic Biodiversity Specialist Assessment Report that contains, as a minimum, the following information:	*This report*
2.7.1. contact details of the specialist, their SACNASP registration number, their field of expertise and a curriculum vitae;	*Appendix 1*
2.7.2. a signed statement of independence by the specialist;	*Attached to EIA / BAR*
2.7.3. a statement on the duration, date and season of the site inspection and the relevance of the season to the outcome of the assessment;	*Section 5 & 6 of this report*
2.7.4. the methodology used to undertake the site inspection and the specialist assessment, including equipment and modelling used, where relevant;	*Section 4*
2.7.5. a description of the assumptions made any uncertainties or gaps in knowledge or data;	*Section 1*
2.7.6. the location of areas not suitable for development, which are to be avoided during construction and operation, where relevant;	*Section 8*
2.7.7. additional environmental impacts expected from the proposed development;	*Section 9*
2.7.8. any direct, indirect, and cumulative impacts of the proposed development on site;	*Section 9*
2.7.9. the degree to which impacts, and risks can be mitigated;	*Section 9*
2.7.10. the degree to which the impacts and risks can be reversed;	*Section 9*
2.7.11. the degree to which the impacts and risks can cause loss of irreplaceable resources;	*Section 9*
2.7.12. a suitable construction and operational buffer for the aquatic ecosystem, using the accepted methodologies;	*Section 4*
2.7.13. proposed impact management actions and impact management outcomes for inclusion in the Environmental Management Programme (EMPr);	*Section 10, 11 & 12*
2.7.14. a motivation must be provided if there were development footprints identified as per paragraph 2.4 above that were identified as having a "low" aquatic biodiversity sensitivity and that were not considered appropriate;	*Section 9*
2.7.15. a substantiated statement, based on the findings of the specialist assessment, regarding the acceptability or not of the proposed development and if the proposed development should receive approval or not; and	*Section 13*
2.7.16. any conditions to which this statement is subjected.	*Section 11*
2.8. The findings of the Aquatic Biodiversity Specialist Assessment must be incorporated into the Basic Assessment Report or the Environmental Impact Assessment Report including the mitigation	*Yes*

Protocol for the Specialist Assessment and Minimum Report Content Requirements for Environmental Impacts on Aquatic Biodiversity	*Section where this has been addressed in the Specialist Report*
and monitoring measures as identified, that are to be included in the EMPr.	
2.9. A signed copy of the assessment must be appended to the Basic Assessment Report or Environmental Impact Assessment Report.	*Yes*

EXTERNAL MESSAGE

Dear Sir/Madam

We have briefly perused the draft EIA report and have been unable to find any reference to the comment submitted by us on the instructions of our client, a copy of which is attached to this email.

Kindly refer us to the relevant pages of the draft report which deal with our client's comments?

We further note from the draft report that a formal application has been lodged with Air Traffic and Navigation Services (ATNS) for a formal obstacles assessment to be conducted. Kindly furnish us with a copy of this application and all communications to and from ATNS relating thereto.

We look forward to hearing from you as a matter of urgency.

Regards

Dear Interested and Affected Party,

Please note that the public comment period for the Draft Environmental Impact Assessment (EIA) Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities has been extended by one day, due to the public holiday on 9 August 2025.

The revised comment period now ends on 15 August 2025.

All other details remain unchanged. We encourage you to submit your comments by the new deadline should you wish to have your input considered in the Final EIA Report.

Thank you for your continued participation.

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

E-mail: stephanie.gopaul@erm.com

Dear Ms. Gopaul

SUBJECT: MTPA'S COMMENTS ON THE DRAFT ENVIRONMENTAL AUTHORISATION APPLICATION FOR THE REVISED EMVELO WIND ENERGY FACILITY COMPRISING OF 24 WIND TURBINES AND AUXILIARY INFRASTRUCTURE. PROJECT FOR EMVELO WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE NUMBER: 14/12/16/3/3/2/2611.

1. INTRODUCTION

The Mpumalanga Tourism and Parks Agency (MTPA) has reviewed the application for the proposed Emvelo Wind Energy Facility (WEF) and associated infrastructure (Reference: 14/12/16/3/3/2/2611), dated 14 July 2025.

The MTPA notes the changes made, such as a revised layout with a reduced number of turbines (now up to 22) and a lower maximum output capacity of up to 240 MW. While these revisions were informed by additional studies identifying sensitive areas requiring avoidance, the modifications often merely shifted turbines into partially transformed areas, with blades and footprints still encroaching on sensitive habitats. These changes are not substantial enough to address our concerns, and the MTPA does not support the current proposed layout.

Key areas of concern include potential impacts on critical habitats such as intact grassland patches, Critical Biodiversity Areas, Important Bird Areas (IBA), climate change corridors, and National Protected Area Expansion Strategy (NPAES) zones; risks to avifauna, including numerous species of conservation concern; perceived shortcomings in specialist assessments and statistical methods; insufficiently tested mitigation measures, especially with respect to buffer zones; and the cumulative impacts within a region already facing significant development pressure.

2. CORE CONCERNS

2.1 Impacts on Sensitive Habitats

Intact Grassland Patches

Intact grassland patches allow species to thrive and to support species that may need to move in response to climate change, enabling the normal functioning of natural ecological processes such as fire regimes or pollination. These patches are typically larger than 100 ha, with little or no gaps and minimal edge effects, and occur in close proximity to other intact grassland patches. They function as "source areas" in metapopulation dynamics where birth rates exceed death rates. No significant impacts should be allowed that would change a source area into a sink area (where death rates exceed birth rates). Mpumalanga has only 1,039 intact grassland patches, covering 15% of the province. These areas have been prioritised for their connectivity importance and must be avoided by wind energy facilities.

The intact patches on Emvelo are critical for maintaining connectivity with other grasslands. Despite MTPA raising concerns, specialist reports were largely silent on their importance. Using over 80,000 bird observations, the MTPA confirmed that intact grasslands have a 22% higher likelihood of hosting birds of conservation concern, 49% more birds of conservation concern, and 98% more individual bird observations than non-intact grasslands. These patches make up 23% of the Emvelo WEF footprint, and six turbines (13, 19, 20, 22, 23, and 25) are located within them. These turbines should be removed.

The MTPA feels strongly that the establishment of wind farms in intact grassland patches should not be allowed as it may turn a "source" area into a "sink" area. Even Pages 3 and 4 of the Faunal assessment within the DEIA recognises that "*Faunal integrity relies on inter-connected grassland habitats across landscapes*." and "*…any contiguous areas of intact grassland are considered as high conservation importance*."

Figure 1: 3D map showing the location of the current turbines. Intact grassland patches are shown in green. Nest sites of threatened birds in red. In the current layout, there are still many turbines in the intact grassland patches.

Other Sensitive Spatial Areas:

Climate Change Corridors

The MBSP's climate change corridor network was designed to enable species and ecosystems to adapt to a changing environment. The corridor network considered a single-best (least-cost) corridor connecting up the climate change refugia with the climate change corridors from adjacent provinces. Additional fine-scale corridors were then identified using Circuitscape, finding alternative pathways and identifying pinch points in the corridors and thereby building resilience into the corridor network.

As can be seen from Figure 2, climate change corridor runs predominantly north-south through the project area, linking the climate change focal areas (as well as coincidentally the Grassland IBA with the Chrissies Pans IBA). Given that large birds do not fly in narrow, predictable lines, a flight corridor would need to be functionally broader than the MTPA provided fine-scale corridor. A broader macro-scaled corridor would be required for avifauna to ensure safe passage along the corridors. Maintaining this linkage is essential for long-term ecological resilience under climate change. The following turbines are within 500m of the climate change corridors and should be removed: 1, 4, 5, 7, and 25, as they would compromise this corridor.

The risk from the proposed wind farm on the corridor network is that the wind farm is unfortunately located along an important north-south macro regional flyway/corridor (also supported by vulture tracking data, Figure 9) which will result in increased collisions and electrocution, and habitat displacement. It stands to disrupt movement along the corridor and result in increased mortalities.

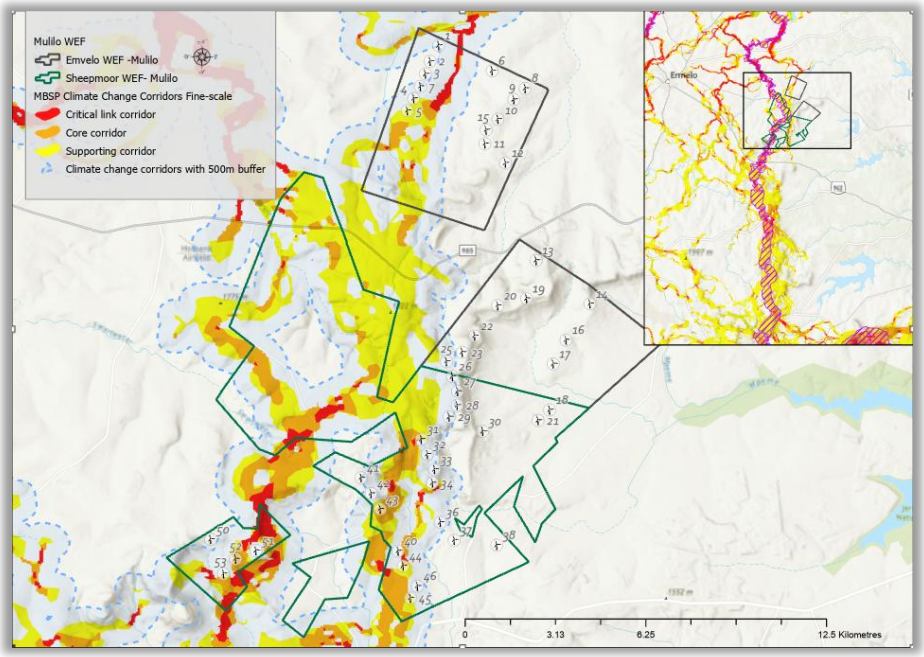

Figure 2: MBSP Climate Change Corridor network that links up climate change priorities with refugia and national climate change corridors. A 500m buffer has been added to the fine-scale corridors due to the need to accommodate mobile avifauna along a macro-scale corridor.

National Protected Area Expansion Strategy (NPAES 2018)

Over 70% of the proposed WEF falls within NPAES spatial priority areas, with 25% of turbines directly on focal areas. These sites are nationally significant for conservation expansion. Currently, seven turbines (13, 14, 19, 20, 22, 23, and 25) are located in NPAES zones and should be removed.

2.2 Avifaunal Risks and Buffer Zones

The site's recognised avian biodiversity, including numerous sensitive and threatened species, necessitates a highly precautionary approach to impact assessment and mitigation. Many of the proposed mitigation measures are novel, untested, and costly. We don't believe the developer has adequately considered the costs of implementing all the recommended mitigation (and curtailment) measures on the success of this project, nor the chances of their efficient implementation (as they rely on models, people, expertise, budgets, and commitment).

Important Bird Areas (IBAs) and IUCN Key Biodiversity Araes (KBAs)

The proposed WEF falls in an area rich in bird species, particularly birds of conservation concern. Thirty-two priority bird species for wind energy development have been recorded within the WEF and broader area. An additional seventy-six species have been recorded which are powerline sensitive. Of particular concern are the occurrence of African Grass Owl (VU), African Marsh-Harrier (EN), Black Harrier (EN), Blue Crane (VU), Blue Korhaan (NT), Cape Vulture (EN), Denham's Bustard (VU), Grey Crowned Crane (EN), Lanner Falcon (VU), Martial Eagle (EN), Secretarybird (EN), Southern Bald Ibis (VU), White-bellied Bustard (VU), and Yellow-breasted Pipit (VU). These are all threatened bird species at risk of extinction, over various timeframes. This rich avifaunal biodiversity is recognised regionally and globally through its inclusion within IBAs and KBAs. IBAs make up 49% and KBAs 65% of the Emvelo WEF.

At the heart of the MTPA's concerns, resulting in our objection, is the rich avifaunal diversity that is at risk of continual loss of mature individuals through collisions and electrocutions.

The avifaunal specialist report acknowledges that collision can be reduced from a high to a medium impact following post-mitigation. However, **with 14 threatened bird species occurring on site**, reducing the impact to a medium level is still significant (if at all possible), as any loss of large individuals may impact the conservation status of these species, particularly in light of cumulative impacts from the 302 planned or approved, and 82 approved wind turbines within 35 km of Emvelo WEF. Additionally, the avifaunal specialist report assessed the cumulative impact of Emvelo WEF to be moderate to high.

BirdLife monitoring report of 2025 states that on average, for every turbine, there are 4.25 bird fatalities per year, and that 10% of these were species of conservation concern. With every turbine added, the risk of collisions increases.

White-winged Flufftail **(**Critically Endangered**)**

- Collision risk modelling results for White-winged Flufftail yielded a mean annual fatality rate of 1.54 birds/year with the original wind turbine layout, which was reduced to 0.45 birds/year with implemented avoidance of core (highly suitable) habitats. For a Critically Endangered species, with only a handful of known localities in South

Africa, we cannot afford to lose 1 bird every 2 years for the next 25 years. This would certainly push this species closer to extinction. This risk is too high.

- The February reports explicitly states a 250 m buffer around White-winged Flufftail habitat, defined through detailed habitat modelling. The July reports mention that White-winged Flufftail habitat is "appropriately buffered" and that "movement corridors were determined and buffered," but the report does not explicitly state a numerical value for this buffer.
- The developer commits to implementing dynamic, real-time nocturnal curtailment i.e., from dawn to dusk for the duration of the summer season, for all wind turbines located within the modelled medium risk zone and traversing White-winged Flufftail habitat connectivity corridors. The following turbines are affected: 26, 27, 28, 29, 31, 44 and 45.
- Of greater concern is the fact that **White-winged Flufftail has been recorded on site although there is scant mention of it**. There is reference to being recorded in the Avifaunal assessment on Page ii, 19, and 21. Its occurrence on site is significant and a fatal flaw.
- BirdLife (Lloyd et al. 2025) distinguishes between *habitat buffer* zones and *species buffer* zones for White-winged Flufftail. Habitat buffer zones maintain ecosystem functions and processes that the species rely on, while species buffer zones protect and maintain the biological needs of a particular species.
- BirdLife published a guideline (Lloyd et al. 2025) for developments with collision risks, like wind turbines, **with buffer zones of at least 5 km between the development and wetlands suitable for the White-winged Flufftail**, with buffer zones of at least 1 km for delineated wetland inputs (habitat buffers). Importantly, the buffers proposed in the avifaunal report equate to the habitat buffers while the species buffer was not implemented. This is a fatal flaw.
- The occurrence of White-winged Flufftail on Emvelo is also confirmed within the Draft REDZ layer on nests, tracking data, roosts and sightings. These points were buffered for the REDZ project, but one can easily find the wetlands within this buffer. This point won't be provided here, to protect the locality, but I buffered this point, and an adjacent one, by 5 km and the result excludes a significant amount of the Emvelo WEF. See Figure 3 below.

African Grass Owl

- African Grass Owl (*Tyto capensis*), a regionally Vulnerable species, has been recorded on Emvelo WEF in the east. These endemic and range-restricted owls have a very small home range of 423 ha (Pretorius 2019). To avoid any impacts to these sites, Pretorius *pers. comm.* recommends this home range be converted to a radius of a circle of 423 ha in size. This equates to a 1160 m buffer. By applying these to the known observations on Emvelo, it affects the placement of turbines 17 (Emvelo) and 18 (Sheepmoor). These localities are buffered and mapped in Figure 4.

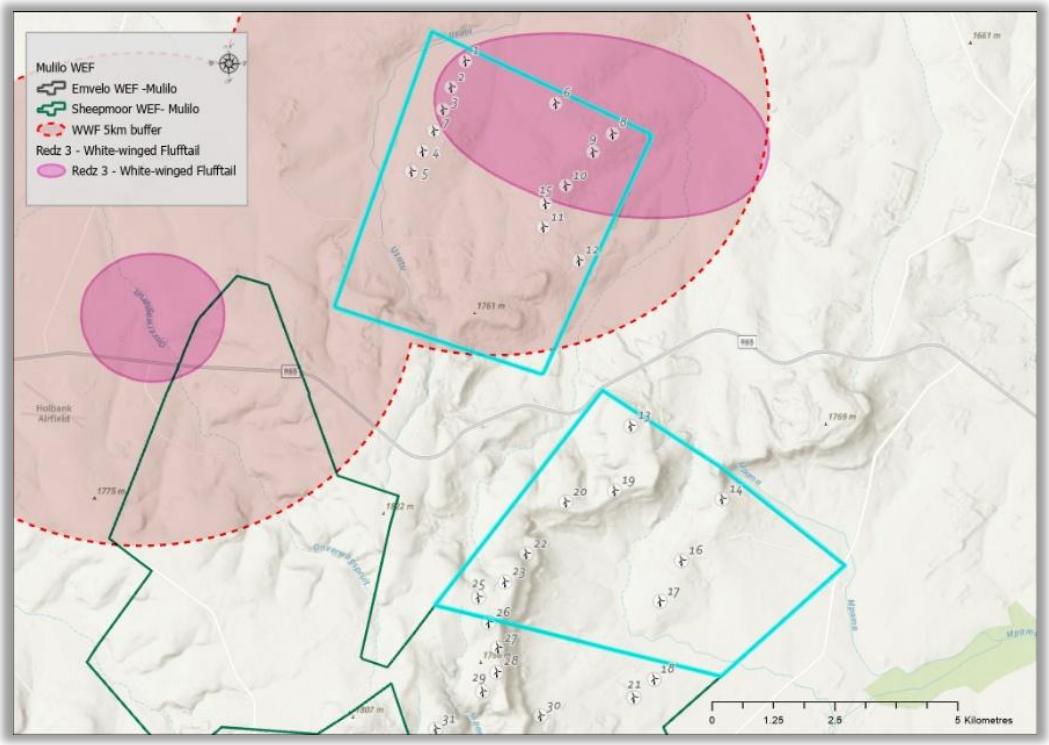

Figure 3: Confirmed White-winged Flufftail within Emvelo WEF, with REDZ 3 locality from Avifaunal risk layer and with point locality buffered by 5 km as a no go to development zone (Lloyd et al. 2025).

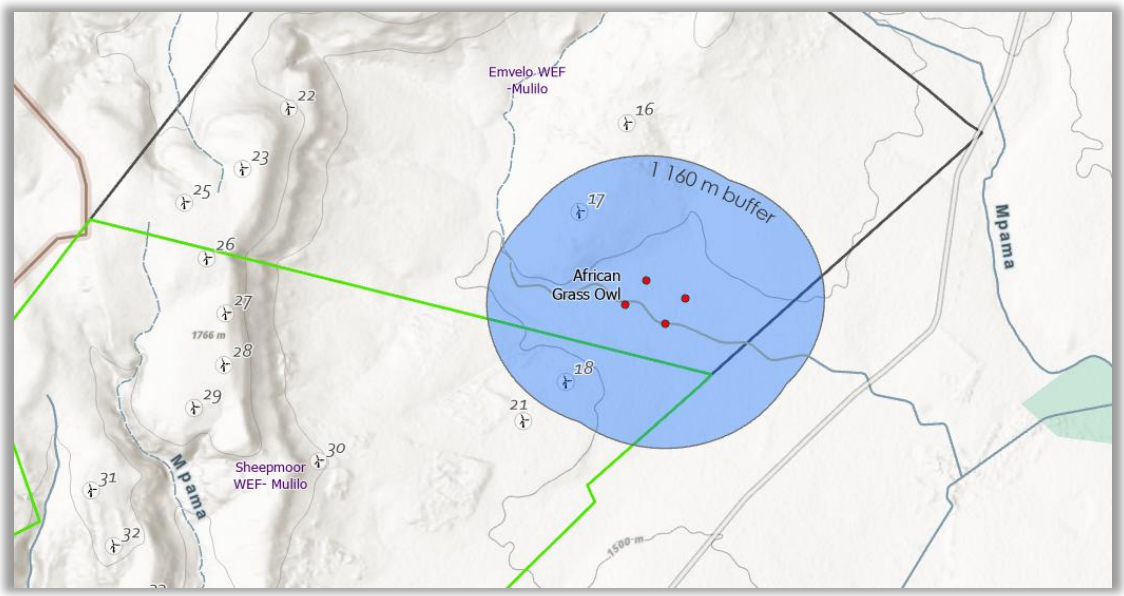

Figure 4: African Grass Own (Vulnerable) localities with the recommended 1160 m buffer to cover their strict home range of 423 ha.

Avifaunal assessment for draft Strategic Environmental Assessment for Phase 3 For Wind and Solar Photovoltaic Energy

The MTPA received the REDZ datasets from the CSIR in May for comment. These datasets may still be refined, but they represent the best available avifaunal data that will eventually inform the DFFE screening tool. Although still a draft product, the dataset is based off actual data and the MTPA believe it to be a significant improvement in the data currently available to evaluate renewable energy applications. Querying this dataset, besides the Critically Endangered White-winged Flufftail being present within the Emvelo footprint, the following important avifaunal datasets cover Emvelo (Table 1). The spatial extent these features is mapped in Figure 5.

Table 1: List of REDZ species and their risk and conservation status occurring over Emvelo and Sheepmoor WEFs.

Species	Risk	RDL Status
African Grass Owl	High	Vulnerable
Cape Vulture	Medium	Endangered (Regionally)
Grey Crowned Crane	High	Endangered
Rudds Lark	High	Endangered
Secretarybird	Very High	Endangered (globally)
Southern Bald Ibis	Very High	Vulnerable
White-winged Flufftail	Very High	Critically Endangered
Wattled Crane	High	Critically Endangered
Yellow breasted Pipit	Very High	Vulnerable

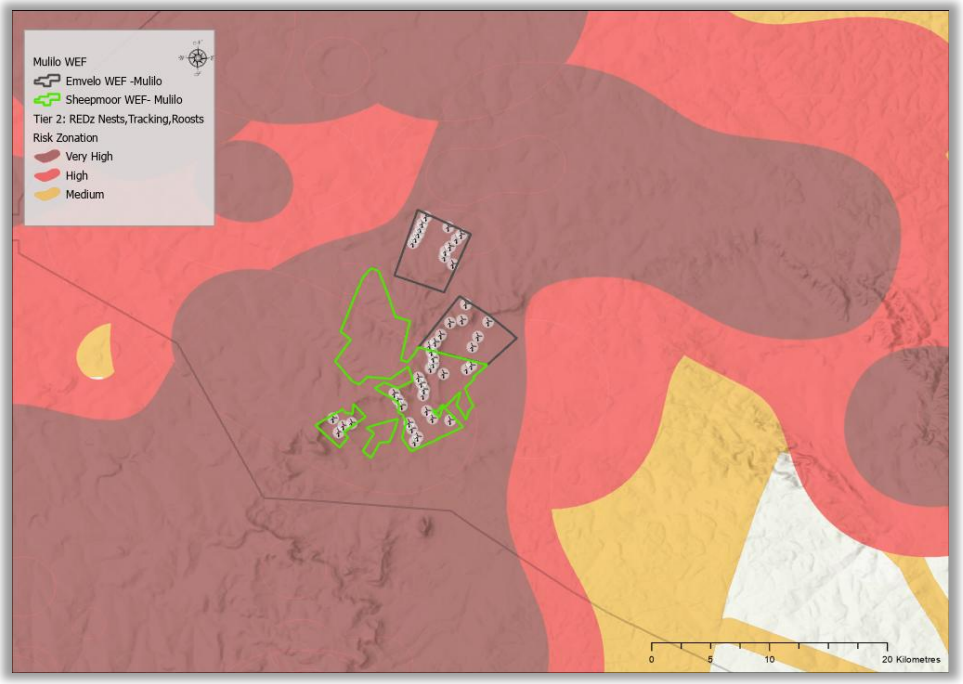

Figure 5: Spatial extent of the Tier 2 draft SEA REDZ 3 avian sensitivity layer covering Emovelo and Sheepmoor WEFs.

Buffers: Martial Eagle

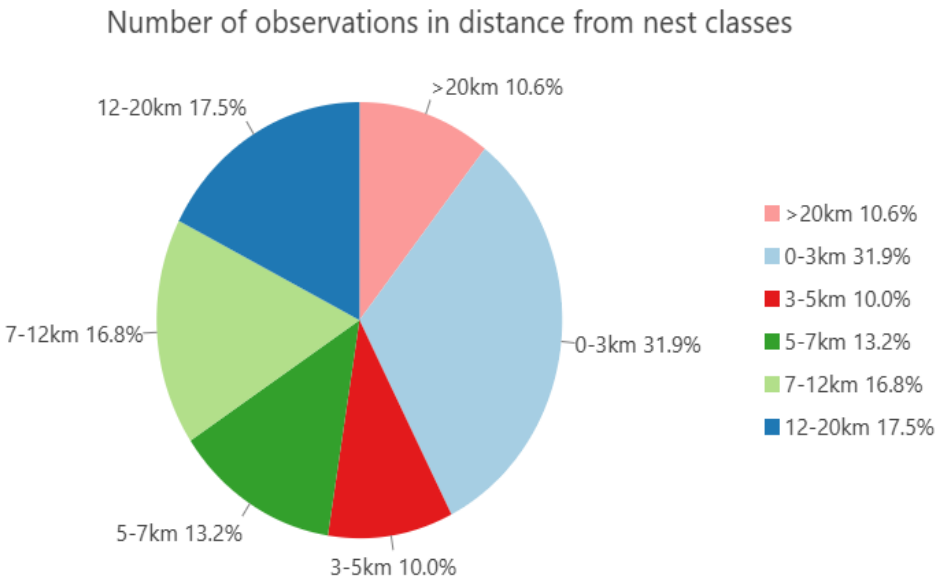
The MTPA has significant concerns regarding the use and modelling of Martial Eagle collar data. The MTPA obtained a copy of the flight data containing 13,111 observation points, compared to the 13,680 observations used by AfriAvian. We used GIS to confirm key findings in the avifaunal assessment, focusing only on data from juvenile and adult tracking collars around the Emvelo and Sheepmoor sites, excluding the Free State male.

EWT previously advised using a 5-6 km buffer around nest sites. More recently, BirdLife (2025) recommended a 6 km buffer around nesting sites. This recommendation aligns with preliminary outputs from the National Martial Eagle Risk Assessment (MERA) tool led by the University of Cape Town, which supports applying a circular buffer of approximately 5 km to include core ranges heavily utilised by resident breeding Martial Eagles, rather than applying bespoke buffers based on tracking and observational flight path data. Given 40 individual collared Martial Eagle tracking datasets, researchers could not build a reliable model to guide wind farm development, as Martial Eagles appear particularly difficult to model for flight patterns.

Against this backdrop, it is concerning that AfriAvian claimed they could accurately model flight risk for Martial Eagles and were confident enough to reduce the nationally recommended buffer by more than 50% (to 2.5 km for the High Risk zone). Such confidence in model output would be required to make this bold decision, as any failure may result in the loss of both parents and the entire breeding pair.

AfriAvian's Approach: AfriAvian combined all GPS tracking data with fine-resolution field monitoring data (37+ hours of observations) to develop a Flight Risk Model. The output was processed to identify High and Medium risk zones. The High risk zone encompassed approximately 79 km², comparable to the area covered by a 5 km circular buffer (78.5 km²) recommended by BirdLife and EWT. However, AfriAvian then extracted from the High risk zone a "Very High risk zone" as their no-go area, relying on Martial Eagle tracking and observational data showing approximately 75% of recorded flight activity within 3 km of the nest. This was not only a subjective decision lacking scientific rigour, but as demonstrated below, the approach is fatally flawed.

Statistical Flaws in the Model: The flight risk model created using machine learning combined coarse-scaled GPS data across a wide area with fine-scaled, dense flight path data from a very limited area (majority within 2 km of nest) (see Figure 18 in the avifaunal assessment). Incorporating detailed, fine-scaled observational flight paths from such a limited area introduces spatial bias, where model output is disproportionately influenced by the more detailed sampling from the fine-resolution area, leading to overrepresentation of that smaller region.



This approach is statistically flawed when differences in spatial area, resolution, sampling intensity, and density are not properly accounted for. This violates spatial statistical assumptions, resulting in inconsistent variance estimates, inaccurate predictions, and biased interpretations that do not accurately reflect broader spatial patterns.

MTPA Analysis and Findings: The MTPA used the same GPS tracking data to verify whether Martial Eagles spent 75% of their recorded flight activity within 3 km of the nest but could not replicate this statistic. We calculated the distance between each GPS observation (n=7266) and the nest, we then categorised each observation into the same distance classes that AfrAvian used in Figure 22 of their report. We used only flight data from the adult female and juvenile in this area, discarding Free State data (nest location unknown).

Importantly, we separated data into two types: (1) the complete dataset covering flying and stationary periods, and (2) a subset including only flying periods (>0.2 km/h). The second dataset was considerably smaller. Although collar tracking was programmed not to record locations between 19:00 and 4:00, 20% of observations were still recorded at before sunrise or after sunset. For flight risk modelling, only observations when birds are flying and at collision risk should be included, not when roosting, nesting, or perched.

We calculated the distance within which 75% of all observations occurred for the full dataset (including evening and nesting periods), finding a distance threshold of 5.6 km. For the flying-only dataset, this distance increased to 13.5 km (see Figures 6 and 7).

For AfriAvian to get to a value of 75% for all observations within 3km of the nest, they must have (1) used all the flight data, including the datasets that were only recorded at the nest (introducing spatial bias and a statistical flaw), (2) they must have used all the observational data, including when the bird was stationary and sitting on a nest, and (3) a different statistical approach to analysing the data. Regardless, our analysis provides a markedly different outcome, aligned with the 5-6 km buffer recommended by EWT and BirdLife, and invalidates the 2.5 km buffer proposed by Mulilo for the High Risk zone. This High Risk zone should be removed as there is no statistical confidence in its delineation, potentially putting birds at collision risk.

Distance from nest class	Flying only localities	Flying / Stationary localities
0-3km	31.9%	58.6%
3-5km	41.9%	60.8%
5-7km	55.1%	77.9%
7-12km	71.9%	85.3%
12-20km	89.4%	95.3%
>20km	100.0%	100.0%

Figure 6: Pie chart showing the number of Martial Eagle observations/points within distance classes from Martial Eagle nest. The table on the right presents the cumulative value of the distance classes, for the entire combined dataset, or with only the localities where the Martial Eagle were flying (>0.2 km/h). Results show that for the entire dataset of 7 266 points, 75% of the observations were within 5.6 km of the nest, while for the flying Martial Eagles, 75% of the records were within 13.5 km of the nest.

Figure 7: Bar-chart showing the number of observations from the collar tracking data in distance classes as used in Figure 22 of avifaunal report. Top-most chart presents all the observations (n=7266) for the adult and juvenile Martial Eagles. The middle chart presents only the observations where the Martial Eagles were flying (n=1122) in distance classes from nest. Bottom chart presents the combined datasets for both juvenile and adult birds in distance classes from nest. Bar chart bars are labelled with actual number of records in each class.

Breeding Cycle Considerations: Martial Eagles display significant differences between breeding and non-breeding periods. They typically breed every second year; therefore, a minimum of two years of data is essential when considering range use to capture both intensive breeding seasons and "sabbatical" periods when Martial Eagles often utilise larger ranges away from nesting sites. The GPS records for both birds covered 1 year and 1 month (10 April 2024 to 9 May 2025), meaning AfriAvian's analysed data did not cover a full two-year cycle.

Adult female Martial Eagles utilise home ranges differently than males, who spend considerable time hunting and provisioning for incubating partners and developing nestlings. During core breeding periods, females exhibit much higher nest site fidelity while males forage extensively over larger ranges. Females typically do not fly as far as males during core breeding seasons; therefore, the exclusion and lack of buffers considering male Martial Eagle range use is concerning. The conclusions did not factor in male flight activity, range use, and flight paths over the Mulilo project area.

Mitigation Concerns: Proposed mitigation measures include curtailment for Martial Eagle flights. However, the avifaunal report found that Martial Eagles are most active at moderate wind speeds of 5.5-10 m/s. Curtailment would significantly impact turbine power generation capacity, and we believe these costs were not considered in assessing the viability of proposed mitigation measures.

With the 5.5 km circular buffer being the current recommended buffer around Martial Eagle nests, the application of a 5.5 km buffer will result in the removal of 16 turbines, namely: 4, 5, 7, 9, 10, 11, 12, 13, 14, 15, 16, 19, 20, 22, 23, and 25. See Figure 8 below.

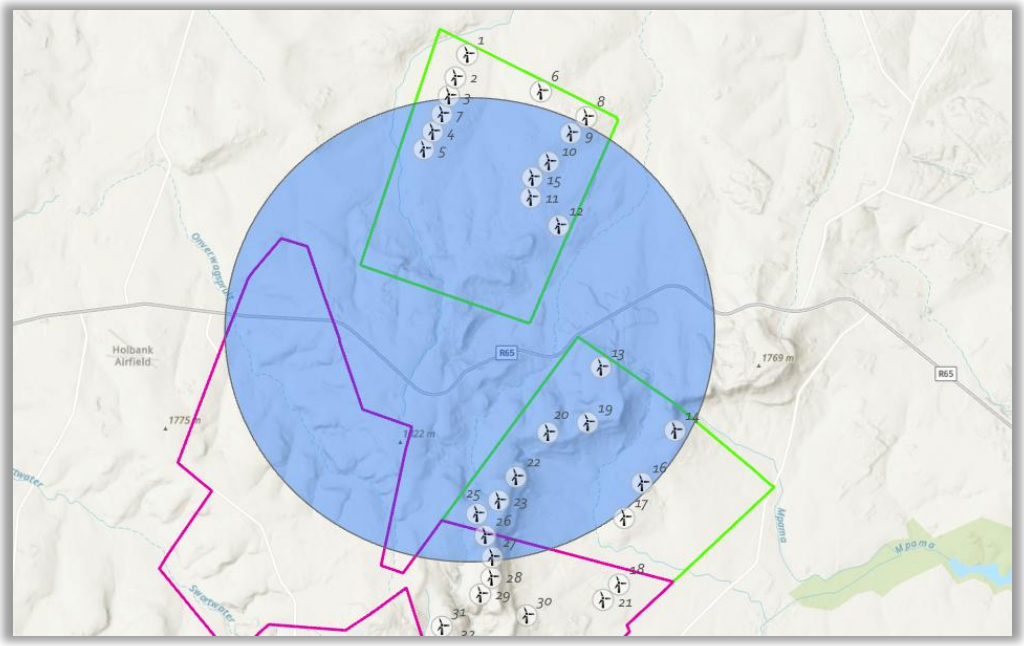


Figure 8: Application of a 5.5 km buffer around the Martial Eagle nest site and the impacted wind turbines.

Avifaunal Assessment: 2 -year of vantage point monitoring required and overreliance of models

Given the site's avifaunal sensitivity, two years of comprehensive avifaunal monitoring would be required. While we understand an additional year was added to monitor the Martial Eagle, this did not include visiting all vantage points as required by BirdLife guidelines. Figure 19 in the Avifaunal assessment shows the limited extent of this additional monitoring, which was confined to the Martial Eagle nest site. Such sensitive and vulnerable avifauna requires more comprehensive monitoring to properly understand and assess potential impacts.

Modelling is used throughout the project sites, from the identification of suitable habitat to avoid, through to predicting where Southern Bald Ibis is likely to fly once leaving a roost, to mitigating impacts. AfriAvian's flamingo model for Leghoya WEF was found to miss 50% of the important pans supporting flamingos (based on actual sightings). We highlight above the spatial bias that was introduced into the Martial Eagle Flight Risk Model, and the inability to replicate and confirm that 75% of the recorded flight activity is within 75% of the nest. George P. Box famously once said "*All models are wrong, but some are useful*". We need to be careful on our reliance on models.

There is an increasing tendency to over rely on models, perhaps because they sound to sophisticated, to mitigate and minimise all possible impacts to acceptable levels. This is wrong. Unless models can be validated with data that was withheld, or gathered afterwards, we need to approach models with caution. Models may be acceptable when they refine boundaries of established circular buffers, but they become problematic when they result in 50% reductions in buffer boundaries without validation or peer review. Our detailed analysis of the Martial Eagle model revealed several critical flaws, as discussed above.

As a result of these repeated issues with model accuracy and validation, the MTPA has become increasingly distrustful of models as primary decision-making tools for sensitive environmental assessments. Robust field monitoring and established precautionary guidelines must take precedence over unvalidated modelling outputs.

Cape Vulture flyways

Cape Vultures are globally vulnerable and regionally endangered. The specialist assessment did observe Cape Vultures over the project area for 48 minutes over 756 hours, and within the rotor swept zone. This amounts to 1 vulture visit every 2 weeks. According to the vantage point priority bird monitoring statistics, Cape Vultures were the 7th most observed priority species (out of 23) over the 1 year of observation.

In the recent Birdlife summary report from monitoring operational wind energy facilities (2025), it provides a case study of a wind farm that recorded a very low numbers of Cape Vultures during pre-construction monitoring (recorded in less than 1% of total vantage point surveys), yet later in the year, once operational, the wind farm had shutdowns involving 384 Cape Vultures. This highlights the need for impact assessments to incorporate all sources of information, and to be careful of initial low observations during pre-construction monitoring.

The MTPA queried the Cape Vulture flight paths on Movebank.org early in April 2025 – See Figure 9 (Kruger NP Raptors E-obs (n=18); Vulpro (Rehab & Captive bred) (n=123); & EWT SigFox Vultures (n=18)) to create the below map showing Cape Vulture flight paths based on density of observations in Movebank.org. This data in Figure 9 clearly shows a north-south flightpath that connects the northern Mpumalanga Escarpment with KwaZulu Natal in the south. And with the

specialist reported observation that the vultures fly within the rotor swept zone, we are very concerned about the risk that the wind farm may pose to vultures as they fly through this corridor. This corridor impacts all the proposed wind turbines.

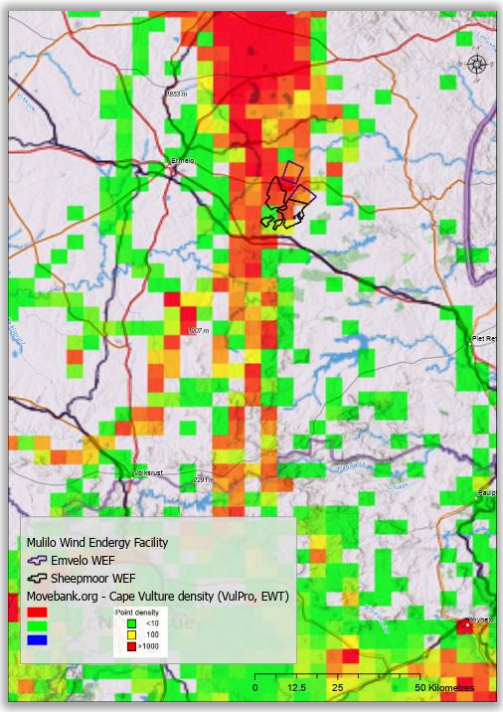

Figure 9: Tracking data from Cape Vultures flying over the Emvelo and Mulilo WEFs. Data sourced from Movebank.org in April 2025. Data source VulPro, EWT. Symbology represents density of recorded points. Red = high density.

Vantage Point Monitoring

Based on the latest and current turbine layout, 5 out of the 22 turbines are not covered by the 2 km vantage point buffers, amounting to 23% of turbines not been covered.

2.3 Specialist Assessments - other

While extensive specialist work has been undertaken, MTPA notes areas where further information or methodological alignment could strengthen the overall environmental assessment.

General

Enhanced integration between the aquatic, faunal, bat, terrestrial and avifaunal assessments is recommended to better understand potential synergistic or cumulative biological impacts.

Faunal Specialist Assessment

Placement of infrastructure in high/very high sensitivity areas warrants careful justification given specialist recommendations to avoid these areas. While we acknowledge the inclusion of a detailed oribi management plan, no detailed oribi survey of this area has occurred, nor is a map of oribi habitat or oribi observations included. Its inclusion at this late stage is only in response to issues raised in the Draft EIA report. Although it is possible that an oribi management plan could improve the local status of the oribi within the footprint area, it can also be said that the failure to adequate survey for oribi since this was raised in the scoping report stage (meeting), means that the proposed development may have a significant negative impact on the oribi. How do we know that turbines, roads, or infrastructure will not be placed in core habitat for oribi? The MTPA has reached out to EWT and they do not know what impact wind turbines will have on this highly sensitive mammal. The developer should not be surveying for oribi after the development is approved, it should have happened during the EIA phase.

Terrestrial Biodiversity Assessment:

The MTPA has significant reservations regarding the Terrestrial Assessment. Key concerns include:

- The terrestrial biodiversity theme is still not aligned with SANBI's Species Environmental Assessment Guideline (2022) that the consultant is required to comply with in terms of Notice 1150 of Government Gazette 43855 of 2020.
- The author only allowed for 4 days to survey both the Sheepmoor and Emvelo WEF sites during the summer months, when most summer rainfall plants would be flowering and identifiable. Four days is certainly not enough to cover an area this size (12,543 ha for both WEFs). This report is the same report as submitted with previous DEIA.
- No plant species of conservation concern, or endemics, were recorded on site. This is not surprising given the lack of time to survey this large area. ERM also opted to appoint a botanist not familiar with the flora of this area. There are several endemics restricted to this area that would be unfamiliar to someone not from the area. It just makes it harder to confirm identification, particularly with limited time and coverage in the field. **The MTPA is confident that several species of conservation concern would occur on site; they were just not detected**.
- The failure to apply the SANBI Guidelines resulted in inadequate time being allowed to properly assess the terrestrial biodiversity (botany) and the determining of site ecological importance (SEI). The consultant did not follow the SEI methodology, as required in terms of the SANBI guidelines and the MTPA does not believe that the approach followed to identify sensitive areas would be able to adequately assess the environmental sensitivity for this area. There were a number of additional variables that could have been applied (site-specific species, CBAs and ESAs, climate change corridors, intact grasslands, rocky ridges, etc.), patch size, together with criteria and approach of that are required in the SANBI Species Environmental Assessment Guidelines.
- The approach followed resulted in some CBA Irreplaceable areas, that overlapped with intact grasslands and provincial climate change corridors, being designated **medium** sensitivity (as a maximum value because it did not ultimately fall within the Eastern Highveld Grassland). This is fundamentally wrong as there was no consideration for any species of conservation concern (like roosting areas) or other spatial priorities like CBAs to meet biodiversity targets. Applying the SANBI criteria could allow the montane grassland to be categorised as *high*, or even *very high* if species and additional data were considered.
- In terms of the terrestrial biodiversity assessment, the result is that the montane grassland (not degraded) is of *medium* sensitivity, but the degraded Highveld grassland has *high* sensitivity, and non-degraded a *very-high*

sensitivity. This does not make sense. We have significantly more threatened plant species recorded in the Wakkerstroom Montane Grassland than for the Eastern Highveld Grassland and consider far more sensitive.

- Ultimately, the MTPA does not agree with the vegetation sensitivity analysis that then fed into other planning processes, such as the offsets, as it did not apply SANBI's Species Environmental Assessment Guideline (2022).

2.4 Biodiversity Offset Report (BOR)

Firstly, the MTPA never requested a biodiversity offset report. When meeting with Mulilo many months ago, Mulilo mentioned they would offset their impacts, and even committed to developing an Oribi Biodiversity Management Plan. In reviewing the first DEAI, the MTPA merely commented that there were no BOR or Oribi management plans.

The MTPA appreciates the effort that has gone into compiling the draft Biodiversity Offset report, however the offset assessment and report only partly covers the residual biodiversity loss to sensitive areas, such as CBAs and Intact Grassland Areas, and not to the avifauna of conservation concern. The offset report should in fact explicitly assess whether any residual impacts affect irreplaceable biodiversity that cannot be offset, which will be a fatal flaw. In addition, the MTPA feel that the anticipated negative impacts to long-lived threatened bird species cannot be adequately quantified nor offset.

The proposed BOR sets specific hectare targets for offsetting the direct loss of natural terrestrial habitats, particularly for areas supporting Species of Conservation Concern (SCC). These targets are based on biodiversity offset ratios, with a total of 507.15 hectares designated for offset, broken down by vegetation type and Mpumalanga Biodiversity Sector Plan (MBSP) category. The core of the terrestrial offset involves restoration efforts on disturbed and transformed areas within the study area. These areas include cultivated lands, disturbed Montane Grassland, disturbed Highveld Grassland, and alien invasive plantations. The aim of the BOR is to create additional habitat for Species of Conservation Concern (SCC), such as the Oribi, by restoring degraded grasslands.

The proposed offset strategy is partly aligned with the national offset strategy, however the formal legal security of the offset sites is incomplete. The BOR is certainly not clear how the site security will be guaranteed over the long term. Mulilo have lease agreements, and mention that servitudes or protected areas declaration may be pursued, but that does not meet the requirement of the offset guideline to do so and secure them. Mulilo proposes several internal onsite areas as offsets. These may not meet the requirements for a protected environment in a wind farm where avifaunal collisions occur. The MTPA will only consider offsets away from areas with turbines as possible protected environments. Hence there is no guarantee that the selected offset areas can ever be secured. Offsite offsets should have been identified and assessed in the report.

Furthermore, the candidate portfolio of offset sites is not provided in any detail. This shortfall is important as it is required for the competent authorities to assess any risks that cannot be offset. In addition, Mulilo commits to monitoring and adaptive management but alignment with the national offset guidelines do require specific biodiversity outcomes, monitoring indicators, success thresholds, and reporting plans.

The long-term financing mechanism and governance of the offsets are not discussed in any detail. It is important to secure long-term management funding (via a trust, endowment, etc.) and the governance arrangements, such as who will manage the sites, who will audit performance, etc.

The BOR also relies on rehabilitating disturbed areas; however, offsets should ideally be in relatively good condition (except for wetlands, which can be disturbed). Once grassland has been ploughed or planted up with trees, the biodiversity does not recover in our lifetime and restoration of these areas do not meet the biodiversity offset requirements.

The BOR includes offsite actions for priority bird species and avifauna buffer concepts, however, these must be converted into measurable outcomes (e.g., collision mortality reduction targets, powerline design/marking standards, and monitoring). Alignment with the national offset strategy requires species-sensitive responses be explicitly built into offset design when species with specific habitat needs are affected.

2.5 Visual Impact

Page 134 in the DEIA states that the visual analysis of the Emvelo project was found to be fatally flawed.

2.6 Cumulative Impacts

The concentration of renewable energy projects in Mpumalanga (890 turbines approved, in process, or planned), particularly along this sensitive escarpment, necessitates careful consideration of cumulative impacts. Each additional project contributes incrementally to regional habitat fragmentation and potential impacts on species populations, especially avifauna. The avifaunal assessment states that the proposed Emvelo WEF, alongside three other renewable energy projects within a 35 km radius, would contribute to a total of 133 turbines in similar habitat. Emvelo's turbines represent approximately 18% of the total planned turbines, indicating a moderate to high cumulative impact. For Emvelo, the cumulative impacts on birds are rated as High pre-mitigation and Medium post-mitigation. Bearing in mind the very optimistic mitigation proposals, dependant on a multitude of models and processes, places the implementation at risk.

The MTPA queried its database on renewable energy projects and actual turbine locations to provide the following important statistics (based on approved, under-consideration, and planned wind farms). Please note that these numbers include the current proposed Emvelo project's turbines within the numbers that are presented.

- *10 km radius*: 57 turbines (none approved)
- *20 km radius*: 107 turbines (2 approved)
- *35 km radius*: 302 turbines (82 approved)

The actual number of turbines approved or in process of being approved is double that what the avifaunal specialist used in their calculations. Yes, the Emvelo addition would make up a smaller percentage but it adds to the threshold beyond which avifauna populations(and bats) may start crashing. With every turbine added, the risk of collisions increases. As these turbines have not been built, the renewable energy industry and government, do not fully comprehend the massive impact that the wind farms will have on the avifauna and bats and the need to preserve sensitive areas to ensure their long terms persistence.

2.7 Acknowledgement of recent change in landcover and impact on spatial mapping products

The delineation of the CBAs and intact grassland patches was based off a landcover map from 2010 and 2019 (but just for CBAs). Any subsequent loss or transformation is not a fault in the MBSP or intact grassland patches, but as a result of a legal or illegal change in land use. In the MBSP Handbook, the guidelines recommend that a site assessment is required to confirm the current land use. Any loss may require additional areas to meet targets (to be addressed in MBSP v2), while acknowledging that **the CBA status may no longer apply to these areas if they have been ploughed or developed** (where recovery is not possible within our lifetimes). Therefore, in terms of the Emvelo WEF, any change in land use from natural to cultivation or plantation would result in this particular area no longer being identified as a CBA or intact grassland patch.

The impact of this has been considered when commenting on turbine placement and those that need to be removed.

3. Summary of Turbine Locations Requiring Reconsideration

Should DFFE proceed towards authorisation, we strongly recommend the exclusion of the turbines identified in below.

- WT 1: KBA, Climate change corridor, within 5km of White-winged Flufftail,
- WT 2: KBA, Within 5km of White-winged Flufftail,
- WT 3: KBA, Within 5km of White-winged Flufftail,
- WT 4: KBA, Climate change corridor, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest.
- WT 5: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 6: KBA, within 5km of White-winged Flufftail,
- WT 7: KBA, CBA, climate change corridor, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 8: KBA, within 5km of White-winged Flufftail,
- WT 9: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 10: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 11: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 12: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 13: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 14: IBA, NPAES, within 5.5 km of Martial Eagle nest
- WT 15: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 16: KBA, IBA, Within 5.5 km of Martial Eagle nest
- WT 17: KBA, IBA, Within African Grass Owl buffer
- WT 19: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 20: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 22: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 23: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 25: IBA, Intact grasslands; climate change corridor, NPAES, within 5.5 km of Martial Eagle nest

4. Closing

In conclusion, the MTPA maintains a strong objection to the proposed Emvelo WEF in its current form. The site overlaps with highly sensitive and irreplaceable biodiversity features—including intact grassland patches, climate change corridors, Critical Biodiversity Areas, KBAs, IBAs, and NPAES priority expansion areas—supporting numerous threatened and endemic species. The avifaunal assemblage present, particularly threatened species such as the White-winged Flufftail, Martial Eagle,

Black Harrier, Denham's Bustard, Cape Vulture, and African Grass Owl, places this site among the most sensitive in the province for wind energy development.

Our review identifies substantial flaws in the baseline data, methodological approaches, and statistical analyses used in the supporting specialist studies, particularly in the avifaunal assessment. Several models relied upon for impact prediction and mitigation zone delineation are unvalidated, contain spatial biases, or deviate from nationally recognised guidelines. Critical surveys, such as comprehensive Oribi assessments and adequate botanical surveys aligned with SANBI protocols, were not completed. As a result, sensitivity mapping, buffer zones, and mitigation recommendations cannot be considered robust or defensible.

The proposed mitigation measures—many novel, untested, and potentially unfeasible—are unlikely to adequately reduce the high to very high pre-mitigation risks to acceptable levels. Given the cumulative turbine density in the broader landscape, the unquantifiable long-term impacts on species with slow reproductive rates, and the loss of ecological connectivity, residual effects are expected to be severe and potentially irreversible.

In light of these factors, the MTPA concludes that the current turbine layout and offset strategy are fatally flawed from both a biodiversity conservation and environmental authorisation perspective. We recommend that authorisation be withheld and that any future proposal for this site be preceded by at least two full years of comprehensive, guideline-aligned monitoring; complete botanical and faunal surveys; and a layout that entirely avoids intact grasslands, key corridors, and critical habitats for species of conservation concern. Only a precautionary, science-based approach can ensure the long-term persistence of the biodiversity assets of this region.

Please do not hesitate to contact this office if there are any enquiries.

Dear Ms. Gopaul

SUBJECT: MTPA COMMENTS ON THE DRAFT ENVIRONMENTAL AUTHORISATION APPLICATION FOR THE REVISED SHEEPMOOR WIND ENERGY FACILITY (WEF) FOR SHEEPMOOR WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE: 14/12/16/3/3/2/2613.

1. INTRODUCTION

The Mpumalanga Tourism and Parks Agency (MTPA) has reviewed the application for the proposed Sheepmoor Wind Energy Facility (WEF) and associated infrastructure (Reference: 14/12/16/3/3/2/2611), dated 14 July 2025.

The MTPA notes the changes made, such as a revised layout with a reduced number of turbines (now up to 25) and a lower maximum output capacity of up to 240 MW. While these revisions were informed by additional studies identifying sensitive areas requiring avoidance, the modifications often merely shifted turbines into partially transformed areas, with blades and footprints still encroaching on sensitive habitats. These changes are not substantial enough to address our concerns, and the MTPA does not support the current proposed layout.

Key areas of concern include potential impacts on critical habitats such as intact grassland patches, Critical Biodiversity Areas, Important Bird Areas (IBA), climate change corridors, and National Protected Area Expansion Strategy (NPAES) zones; risks to avifauna, including numerous species of conservation concern; perceived shortcomings in specialist assessments and statistical methods; insufficiently tested mitigation measures, especially with respect to buffer zones; and the cumulative impacts within a region already facing significant development pressure.

2. CORE CONCERNS

2.1 Impacts on Sensitive Habitats

Intact Grassland Patches

Intact grassland patches allow species to thrive and to support species that may need to move in response to climate change, enabling the normal functioning of natural ecological processes such as fire regimes or pollination. These patches are typically larger than 100 ha, with little or no gaps and minimal edge effects, and occur in close proximity to other intact grassland patches. They function as "source areas" in metapopulation dynamics where birth rates exceed death rates. No significant impacts should be allowed that would change a source area into a sink area (where death rates exceed birth rates). Mpumalanga has only 1,039 intact grassland patches, covering 15% of the province. These areas have been prioritised for their connectivity importance and must be avoided by wind energy facilities.

The intact patches on Sheepmoor are critical for maintaining connectivity with other grasslands. Despite MTPA raising concerns, specialist reports were largely silent on their importance. Using over 80,000 bird observations, the MTPA confirmed that intact grasslands have a 22% higher likelihood of hosting birds of conservation concern, 49% more birds of conservation concern, and 98% more individual bird observations than non-intact grasslands. These patches make up 23% of the Sheepmoor WEF footprint, and eight turbines (26, 27, 28, 29, 31, 32, 33, and 43) are located within them. These turbines should be removed. See Figure 1.

Therefore, the MTPA feels stronger than ever that the establishment of wind farms in intact grassland patches should not be allowed as it may turn a "source" area into a "sink" area. Even Page 3 and 4 of the Faunal assessment within the DEIA recognises that "*Faunal integrity relies on inter-connected grassland habitats across landscapes*." and "*…any contiguous areas of intact grassland are considered as high conservation importance*."

Figure 1: 3D map showing the location of the current turbines. Intact grassland patches are shown in green. Nest sites of threatened birds in red. In the current layout, there are still many turbines in the intact grassland patches.

Other Sensitive Spatial Areas:

Climate Change Corridors

The MBSP's climate change corridor network was designed to enable species and ecosystems to adapt to a changing environment. The corridor network considered a single-best (least-cost) corridor connecting up the climate change refugia with the climate change corridors from adjacent provinces. Additional fine-scale corridors were then identified using Circuitscape, finding alternative pathways and identifying pinch points in the corridors and thereby building resilience into the corridor network.

As can be seen from Figure 2, climate change corridor runs predominantly north-south through the project area, linking the climate change focal areas (as well as coincidentally the Grassland IBA with the Chrissies Pans IBA). Given that large birds do not fly in narrow, predictable lines, a flight corridor would need to be functionally broader than the MTPA provided fine-scale corridor. A broader macro-scaled corridor would be required for avifauna to ensure safe passage along the corridors. Maintaining this linkage is essential for long-term ecological resilience under climate change. The following turbines are within 500m of the climate change corridors and should be removed: 29, 31, 32, 33, 34, 36, 40, 42, 43, 44, 45, 46, 51, 52, and 53, as they would compromise this corridor.

The risk from the proposed wind farm on the corridor network is that the wind farm is unfortunately located along an important north-south macro regional flyway/corridor (also supported by vulture tracking data, Figure 9) which will result in increased collisions and electrocution, and habitat displacement. It stands to disrupt movement along the corridor and result in increased mortalities.

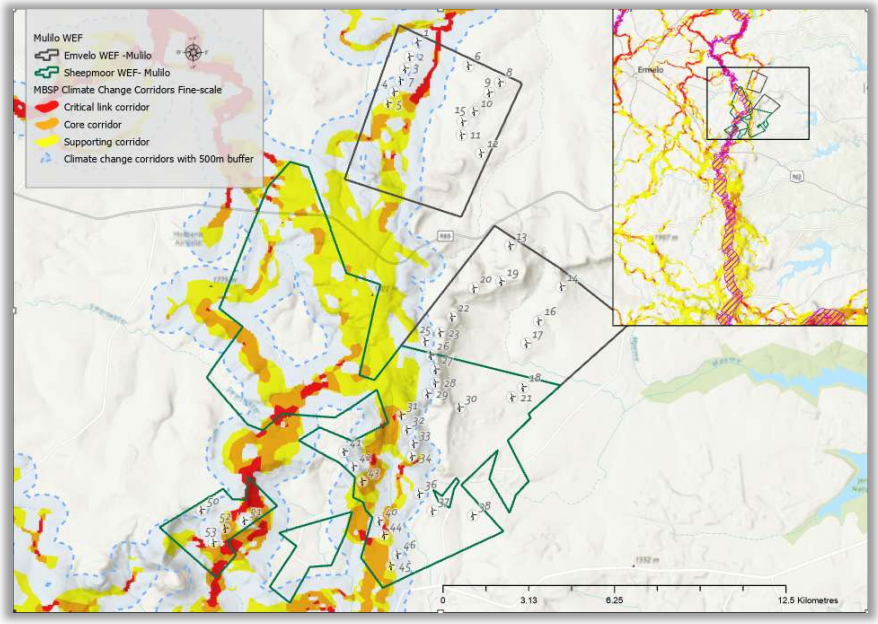

Figure 2: MBSP Climate Change Corridor network that links up climate change priorities with refugia and national climate change corridors. A 500m buffer has been added to the fine-scale corridors due to the need to accommodate mobile avifauna along a macro-scale corridor.

National Protected Area Expansion Strategy (NPAES 2018)

Over 60% of the proposed WEF falls within NPAES spatial priority areas, with 25% of turbines directly on focal areas. These sites are nationally significant for conservation expansion. Currently, 11 turbines (26, 27, 28, 29, 31, 33, 43, 44, 45, 52 and 53) are located in NPAES zones and should be removed.

2.2 Avifaunal Risks and Buffer Zones

The site's recognised avian biodiversity, including numerous sensitive and threatened species, necessitates a highly precautionary approach to impact assessment and mitigation. Many of the proposed mitigation measures are novel, untested, and costly. We don't believe the developer has adequately considered the costs of implementing all the recommended mitigation (and curtailment) measures on the success of this project, nor the chances of their efficient implementation (as they rely on models, people, expertise, budgets, and commitment).

Important Bird Areas (IBAs) and IUCN Key Biodiversity Araes (KBAs)

The proposed WEF falls in an area rich in bird species, particularly birds of conservation concern. Thirty-two priority bird species for wind energy development have been recorded within the WEF and broader area. An additional seventy-six species have been recorded which are powerline sensitive. Of particular concern are the occurrence of African Marsh-Harrier (EN), Black Harrier (EN), Blue Crane (VU), Blue Korhaan (NT), Cape Vulture (EN), Denham's Bustard (VU), Grey Crowned Crane (EN), Lanner Falcon (VU), Martial Eagle (EN), Secretarybird (EN), Southern Bald Ibis (VU), White-bellied Bustard (VU), and Yellow-breasted Pipit (VU). These are all threatened bird species at risk of extinction, over various timeframes. This rich avifaunal biodiversity is recognised regionally and globally through its inclusion within IBAs and KBAs. IBAs make up 55% and KBAs 12% of the Sheepmoor WEF.

At the heart of the MTPA's concerns, resulting in our objection, is the rich avifaunal diversity that is at risk of continual loss of mature individuals through collisions and electrocutions.

The avifaunal specialist report acknowledges that collision can be reduced from a high to a medium impact following post-mitigation. However, **with 14 threatened bird species occurring on site**, reducing the impact to a medium level is still significant (if at all possible), as any loss of large individuals may impact the conservation status of these species, particularly in light of cumulative impacts from the 359 planned or approved, and 127 approved wind turbines within 35 km of Sheepmoor WEF. Additionally, the avifaunal specialist report assessed the cumulative impact of Sheepmoor WEF to be moderate to high.

BirdLife monitoring report of 2025 states that on average, for every turbine, there are 4.25 bird fatalities per year, and that 10% of these were species of conservation concern. With every turbine added, the risk of collisions increases.

Avifaunal assessment for draft Strategic Environmental Assessment for Phase 3 For Wind and Solar Photovoltaic Energy

The MTPA received the REDZ datasets from the CSIR in May for comment. These datasets may still be refined, but they represent the best available avifaunal data that will eventually inform the DFFE screening tool. Although still a draft product, the dataset is based off actual data and the MTPA believe it to be a significant improvement in the data currently available to evaluate renewable energy applications. Querying this dataset the following important avifaunal datasets cover Sheepmoor (Table 1). The spatial extent these features is mapped in Figure 3.

Table 1: List of REDZ species and their risk and conservation status occurring over Emvelo and Sheepmoor WEFs.

Species	Risk	RDL Status
African Grass Owl	High	Vulnerable
Cape Vulture	Medium	Endangered (Regionally)
Grey Crowned Crane	High	Endangered
Rudds Lark	High	Endangered
Secretarybird	Very High	Endangered (globally)
Southern Bald Ibis	Very High	Vulnerable
White-winged Flufftail	Very High	Critically Endangered
Wattled Crane	High	Critically Endangered
Yellow breasted Pipit	Very High	Vulnerable

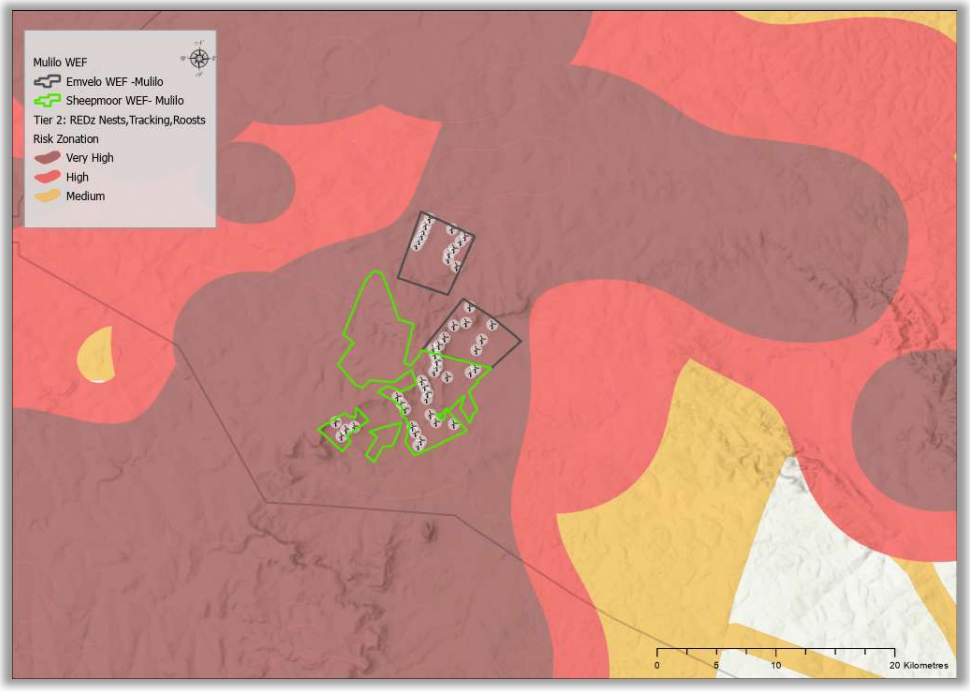

Figure 3: Spatial extent of the Tier 2 draft SEA REDZ 3 avian risk sensitivity layer covering Emovelo and Sheepmoor.

Buffers: Southern Bald Ibis

The specialist proposes shaped buffers based on modelled flight patterns, allowing turbines effectively within 506m (potentially as close as 100m) of roosts/nests. This represents a significant reduction from standard recommendations (1-2.5km) and appears inadequately precautionary, especially as it doesn't explicitly incorporate rotor overhang. Concern is raised about the accuracy and reliance of flight paths derived from observational vantage points. Confidence in these buffers is further reduced by the extremely limited flight path data used in their modelling. In the absence of a validated or peer-reviewed model, the MTPA recommends a minimum 1km buffer around these breeding colonies, which would require removal of turbines 28, 29, and 41. See Figure 4 for the 1km buffer zone and affected turbine locations.

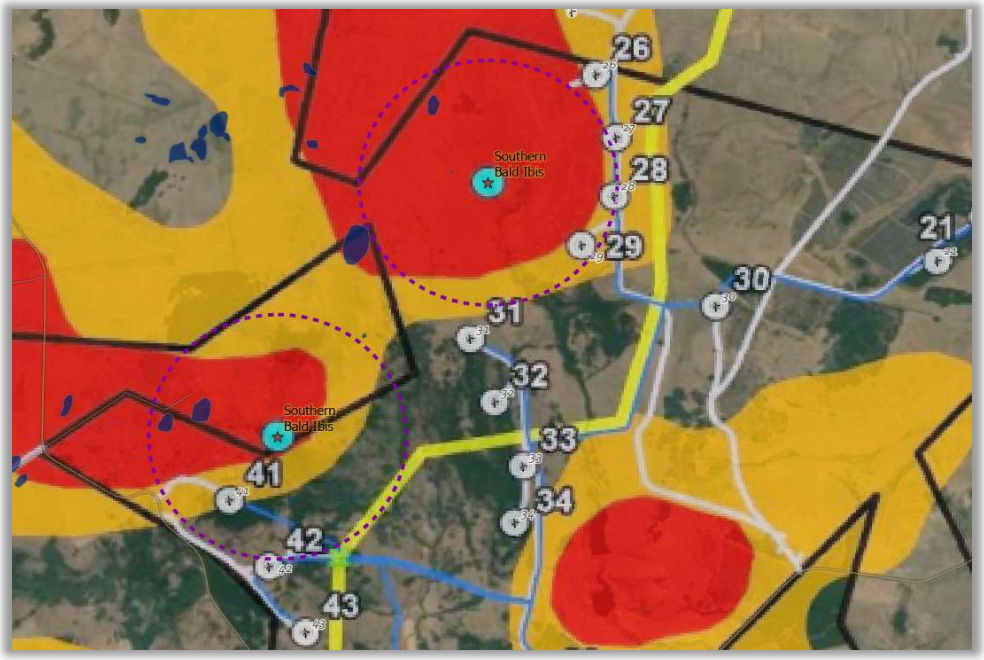

Figure 4: Map from avifaunal specialist report (July 2025) showing the Sheepmoor Southern Bald Ibis sensitivities and their proposed shaped buffer, a deviation from the standard 1km buffer. The purple dotted line represents a 1km buffer that then touches on several turbines.

African Grass Owl

African Grass Owl (*Tyto capensis*), a regionally Vulnerable species, has been recorded on Emvelo WEF in the east. These endemic and range-restricted owls have a very small home range of 423 ha (Pretorius 2019). To avoid any impacts to these sites, Pretorius *pers. comm.* recommends this home range be converted to a radius of a circle of 423 ha in size. This equates to a 1160 m buffer. By applying these to the known observations on Emvelo, it affects the placement of turbines 17 (Emvelo) and 18 (Sheepmoor). These localities are buffered and mapped in Figure 5.

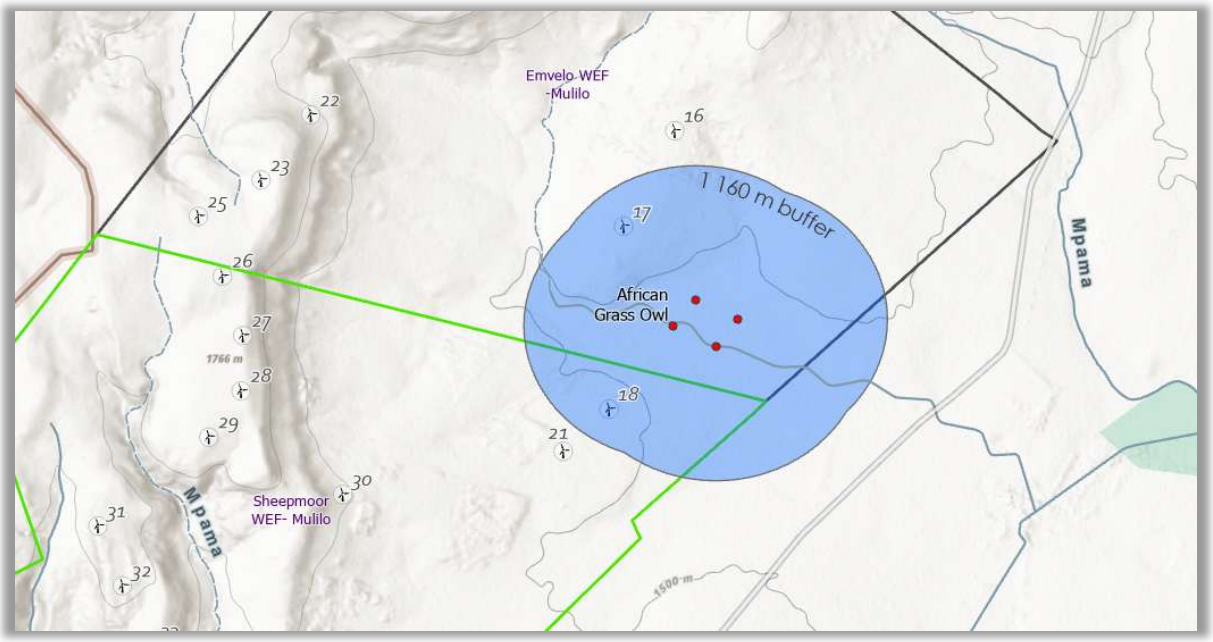

Figure 5: African Grass Own (Vulnerable) localities with the recommended 1160 m buffer to cover their strict home range of 423 ha.

Buffers: Martial Eagle

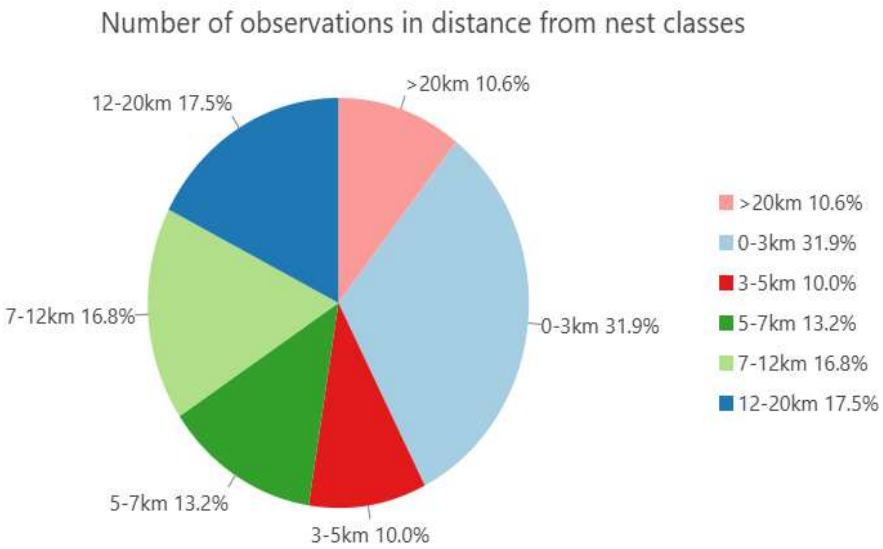
The MTPA has significant concerns regarding the use and modelling of Martial Eagle collar data. The MTPA obtained a copy of the flight data containing 13,111 observation points, compared to the 13,680 observations used by AfriAvian. We used GIS to confirm key findings in the avifaunal assessment, focusing only on data from juvenile and adult tracking collars around the Emvelo and Sheepmoor sites, excluding the Free State male.

EWT previously advised using a 5-6 km buffer around nest sites. More recently, BirdLife (2025) recommended a 6 km buffer around nesting sites. This recommendation aligns with preliminary outputs from the National Martial Eagle Risk Assessment (MERA) tool led by the University of Cape Town, which supports applying a circular buffer of approximately 5 km to include core ranges heavily utilised by resident breeding Martial Eagles, rather than applying bespoke buffers based on tracking and observational flight path data. Given 40 individual collared Martial Eagle tracking datasets, researchers could not build a reliable model to guide wind farm development, as Martial Eagles appear particularly difficult to model for flight patterns.

Against this backdrop, it is concerning that AfriAvian claimed they could accurately model flight risk for Martial Eagles and were confident enough to reduce the nationally recommended buffer by more than 50% (to 2.5 km for the High Risk zone). Such confidence in model output would be required to make this bold decision, as any failure may result in the loss of both parents and the entire breeding pair.

AfriAvian's Approach: AfriAvian combined all GPS tracking data with fine-resolution field monitoring data (37+ hours of observations) to develop a Flight Risk Model. The output was processed to identify High and Medium risk zones. The High risk zone encompassed approximately 79 km², comparable to the area covered by a 5 km circular buffer (78.5 km²) recommended by BirdLife and EWT. However, AfriAvian then extracted from the High risk zone a "Very High risk zone" as their no-go area, relying on Martial Eagle tracking and in-field observational data showing approximately 75% of recorded flight activity within 3 km of the nest. This was not only a subjective decision lacking scientific rigour, but as demonstrated below, the approach is fatally flawed.

Statistical Flaws in the Model: The flight risk model created using machine learning combined coarse-scaled GPS data across a wide area with fine-scaled, dense flight path data from a very limited area (majority within 2 km of nest) (see Figure 18 in the avifaunal assessment). Incorporating detailed, fine-scaled observational flight paths from such a limited area introduces spatial bias, where model output is disproportionately influenced by the more detailed sampling from the fine-resolution area, leading to overrepresentation of that smaller region.



This approach is statistically flawed when differences in spatial area, resolution, sampling intensity, and density are not properly accounted for. This violates spatial statistical assumptions, resulting in inconsistent variance estimates, inaccurate predictions, and biased interpretations that do not accurately reflect broader spatial patterns.

MTPA Analysis and Findings: The MTPA used the same GPS tracking data to verify whether Martial Eagles spent 75% of their recorded flight activity within 3 km of the nest but could not replicate this statistic. We calculated the distance between each GPS observation (n=7266) and the nest, we then categorised each observation into the same distance classes that AfrAvian used in Figure 22 of their report. We used only flight data from the adult female and juvenile in this area, discarding Free State data (nest location unknown).

Importantly, we separated data into two types: (1) the complete dataset covering flying and stationary periods, and (2) a subset including only flying periods (>0.2 km/h). The second dataset was considerably smaller. Although collar tracking was programmed not to record locations between 19:00 and 4:00, 20% of observations were still recorded at before sunrise or after sunset. For flight risk modelling, only observations when birds are flying and at collision risk should be included, not when roosting, nesting, or perched.

We calculated the distance within which 75% of all observations occurred for the full dataset (including evening and nesting periods), finding a distance threshold of 5.6 km. For the flying-only dataset, this distance increased to 13.5 km (see Figures 6 and 7).

For AfriAvian to get to a value of 75% for all observations within 3km of the nest, they must have (1) used all the flight data, including the datasets that were only recorded at the nest (introducing spatial bias and a statistical flaw), (2) they must have used all the observational data, including when the bird was stationary and sitting on a nest, and (3) a different statistical approach to analysing the data. Regardless, our analysis provides a markedly different outcome, aligned with the 5-6 km buffer recommended by EWT and BirdLife, and invalidates the 2.5 km buffer proposed by Mulilo for the High Risk zone. This High Risk zone should be removed as there is no statistical confidence in its delineation, potentially putting birds at collision risk.

Distance from nest class	Flying only localities	Flying / Stationary localities
0-3km	31.9%	58.6%
3-5km	41.9%	60.8%
5-7km	55.1%	77.9%
7-12km	71.9%	85.3%
12-20km	89.4%	95.3%
>20km	100.0%	100.0%

Figure 6: Pie chart showing the number of Martial Eagle observations/points within distance classes from Martial Eagle nest. The table on the right presents the cumulative value of the distance classes, for the entire combined dataset, or with only the localities where the Martial Eagle were flying (>0.2 km/h). Results show that for the entire dataset of 7 266 points, 75% of the observations were within 5.6 km of the nest, while for the flying Martial Eagles, 75% of the records were within 13.5 km of the nest.

Breeding Cycle Considerations: Martial Eagles display significant differences between breeding and non-breeding periods. They typically breed every second year; therefore, a minimum of two years of data is essential when considering range use to capture both intensive breeding seasons and "sabbatical" periods when Martial Eagles often utilise larger ranges away from nesting sites. The GPS records for both birds covered 1 year and 1 month (10 April 2024 to 9 May 2025), meaning AfriAvian's analysed data did not cover a full two-year cycle.

Adult female Martial Eagles utilise home ranges differently than males, who spend considerable time hunting and provisioning for incubating partners and developing nestlings. During core breeding periods, females exhibit much higher nest site fidelity while males forage extensively over larger ranges. Females typically do not fly as far as males during core breeding seasons; therefore, the exclusion and lack of buffers considering male Martial Eagle range use is concerning. The conclusions did not factor in male flight activity, range use, and flight paths over the Mulilo project area.

Mitigation Concerns: Proposed mitigation measures include curtailment for Martial Eagle flights. However, the avifaunal report found that Martial Eagles are most active at moderate wind speeds of 5.5-10 m/s. Curtailment would significantly impact turbine power generation capacity, and we believe these costs were not considered in assessing the viability of proposed mitigation measures.

With the 5.5 km circular buffer being the current recommended buffer around Martial Eagle nests, the application of a 5.5 km buffer will result in the removal of 2 turbines, namely: 26 and 27. See Figure 8 below.

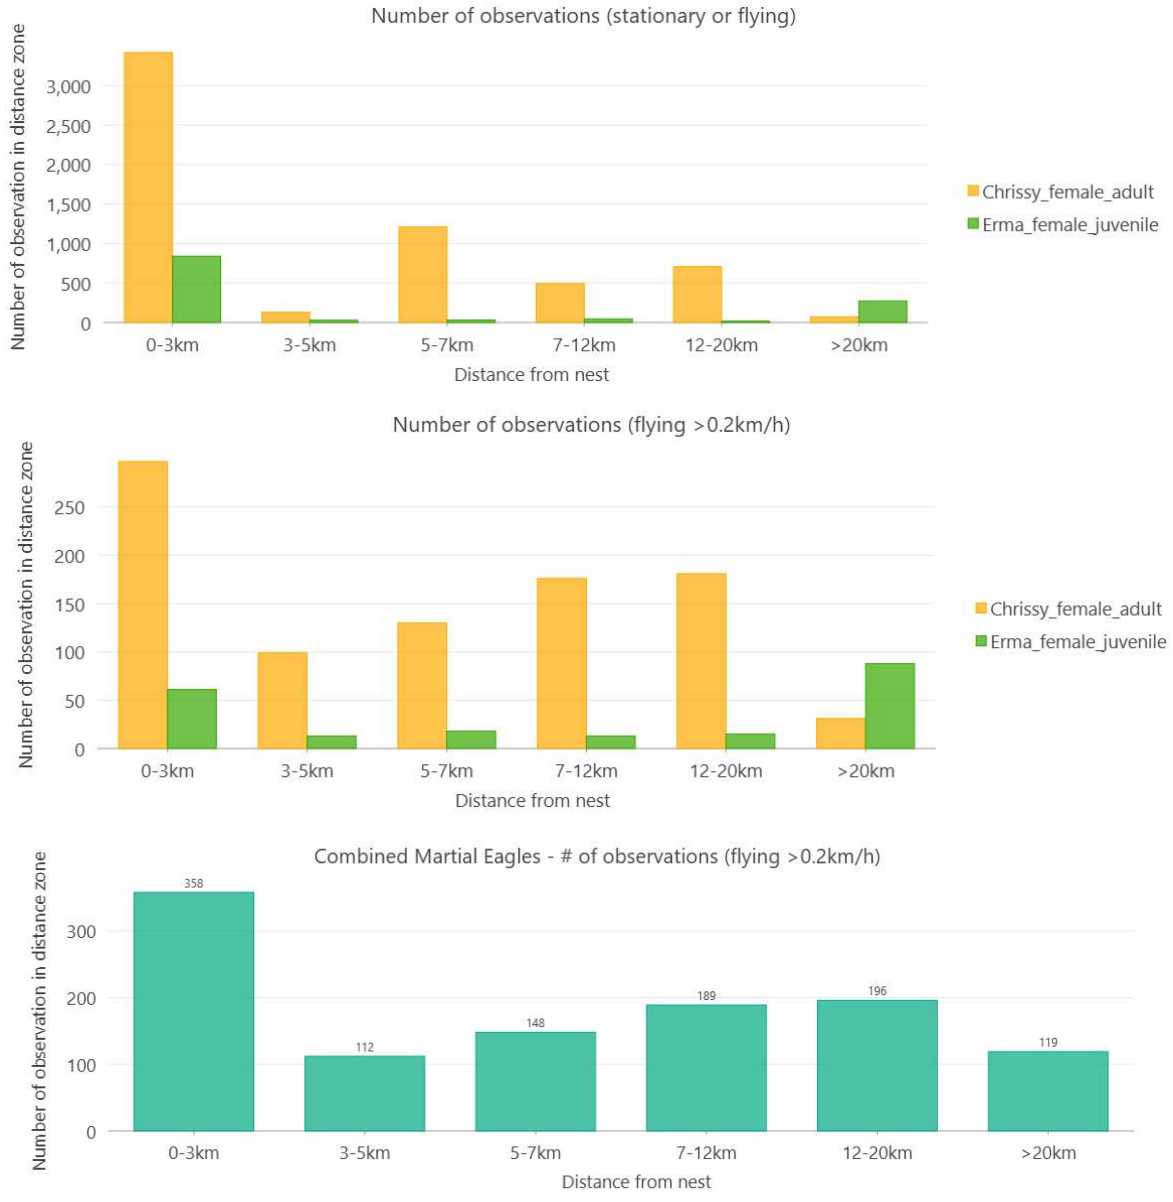


Figure 7: Bar-chart showing the number of observations from the collar tracking data in distance classes as used in Figure 22 of avifaunal report. Top-most chart presents all the observations (n=7266) for the adult and juvenile Martial Eagles. The middle chart presents only the observations where the Martial Eagles were flying (n=1122) in distance classes from nest. Bottom chart presents the combined datasets for both juvenile and adult birds in distance classes from nest. Bar chart bars are labelled with actual number of records in each class.

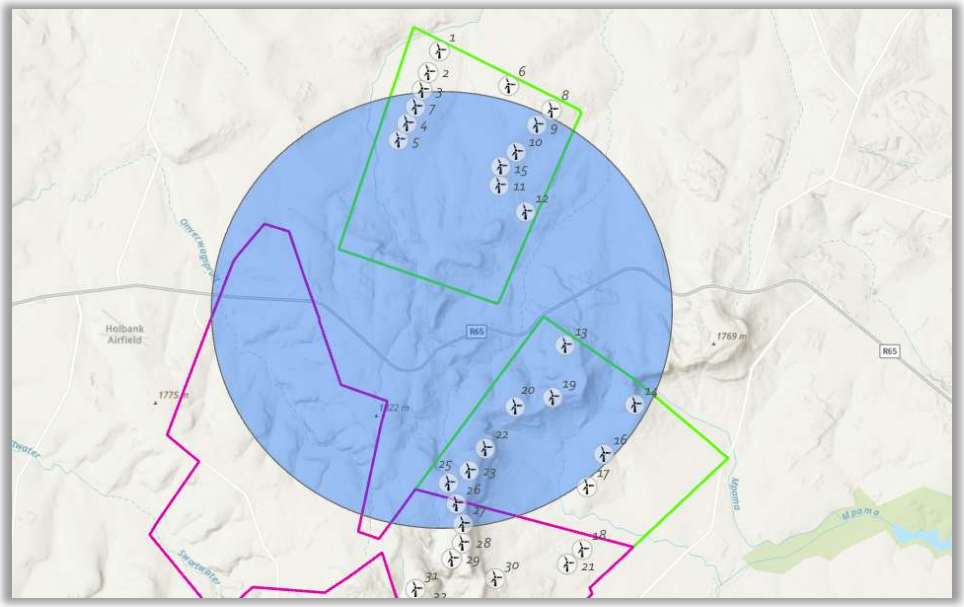

Figure 8: Application of a 5.5 km buffer around the Martial Eagle nest site and the impacted wind turbines.

Avifaunal Assessment: 2 -year of data gathering required and overreliance of models

Given the site's avifaunal sensitivity, two years of comprehensive avifaunal monitoring would be required. While we understand an additional year was added to monitor the Martial Eagle, this did not include visiting all vantage points as required by BirdLife guidelines. Figure 19 in the Avifaunal assessment shows the limited extent of this additional monitoring, which was confined to the Martial Eagle nest site. Such sensitive and vulnerable avifauna requires more comprehensive monitoring to properly understand and assess potential impacts.

Modelling is used throughout the project sites, from the identification of suitable habitat to avoid, through to predicting where Southern Bald Ibis is likely to fly once leaving a roost, to mitigating impacts. AfriAvian's flamingo model for Leghoya WEF was found to miss 50% of the important pans supporting flamingos (based on actual sightings). We highlight above the spatial bias that was introduced into the Martial Eagle Flight Risk Model, and the inability to replicate and confirm that 75% of the recorded flight activity is within 75% of the nest. George P. Box famously once said "*All models are wrong, but some are useful*".

There is an increasing tendency to over rely on models, perhaps because they sound to sophisticated, to mitigate and minimise all possible impacts to acceptable levels. This is wrong. Unless models can be validated with data that was withheld, or gathered afterwards, we need to approach models with caution. Models may be acceptable when they refine boundaries of established circular buffers, but they become problematic when they result in 50% reductions in buffer boundaries without validation or peer review. Our detailed analysis of the Martial Eagle model revealed several critical flaws, as discussed above.

As a result of these repeated issues with model accuracy and validation, the MTPA has become increasingly distrustful of models as primary decision-making tools for sensitive environmental assessments. Robust field monitoring and established precautionary guidelines must take precedence over unvalidated modelling outputs.

Cape Vulture flyways

Cape Vultures are globally vulnerable and regionally endangered. The specialist assessment did observe Cape Vultures over the project area for 48 minutes over 756 hours, and within the rotor swept zone. This amounts to 1 vulture visit every 2 weeks. According to the vantage point priority bird monitoring statistics, Cape Vultures were the 7th most observed priority species (out of 23) over the 1 year of observation.

In the recent Birdlife summary report from monitoring operational wind energy facilities (2025), it provides a case study of a wind farm that recorded a very low numbers of Cape Vultures during pre-construction monitoring (recorded in less than 1% of total vantage point surveys), yet later in the year, once operational, the wind farm had shutdowns involving 384 Cape Vultures. This highlights the need for impact assessments to incorporate all sources of information, and to be careful of initial low observations during pre-construction monitoring.

The MTPA queried the Cape Vulture flight paths on Movebank.org early in April 2025 – See Figure 9 (Kruger NP Raptors E-obs (n=18); Vulpro (Rehab & Captive bred) (n=123); & EWT SigFox Vultures (n=18)) to create the below map showing Cape Vulture flight paths based on density of observations in Movebank.org. This data in Figure 9 clearly shows a north-south flightpath that connects the northern Mpumalanga Escarpment with KwaZulu Natal in the south. And with the specialist reported observation that the vultures fly within the rotor swept zone, we are very concerned about the risk that the wind farm may pose to vultures as they fly through this corridor. This corridor impacts all the proposed wind turbines.

Vantage Point Monitoring

Based on the latest and current turbine layout, 3 of the 25 turbines are not covered by the 2km vantage point buffers, amounting to 12% of turbines not been covered.

2.3 Specialist Assessments

While extensive specialist work has been undertaken, MTPA notes areas where further information or methodological alignment could strengthen the overall environmental assessment.

General

Enhanced integration between the aquatic, faunal, bat, terrestrial and avifaunal assessments is recommended to better understand potential synergistic or cumulative biological impacts.

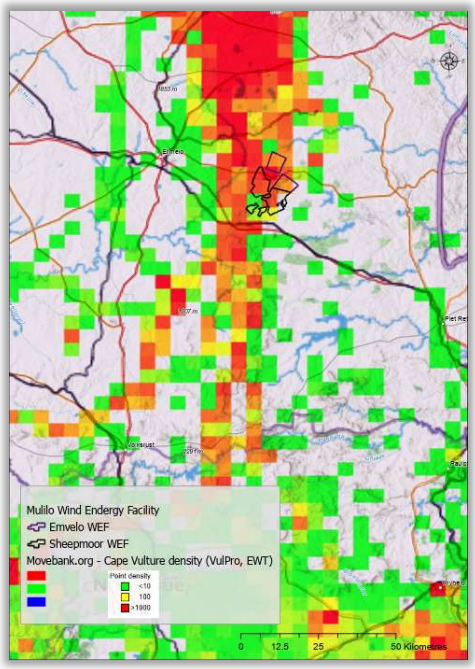

Figure 9: Tracking data from Cape Vultures flying over the Emvelo and Mulilo WEFs. Data sourced from Movebank.org in April 2025. Data source VulPro, EWT. Symbology represents density of recorded points. Red = high density.

Faunal Specialist Assessment

Placement of infrastructure in high/very high sensitivity areas warrants careful justification given specialist recommendations to avoid these areas. While we acknowledge the inclusion of a detailed oribi management plan, no detailed oribi survey of this area has occurred, nor is a map of oribi habitat or oribi observations included. Its inclusion at this late stage is only in response to issues raised in the Draft EIA report. Although it is possible that an oribi management plan could improve the local status of the oribi within the footprint area, it can also be said that the failure to adequate survey for oribi since this was raised in the scoping report stage (meeting), means that the proposed development may have a significant negative impact on the oribi. How do we know that turbines, roads, or infrastructure will not be placed in core habitat for oribi? The MTPA has reached out to EWT and they do not know what impact wind turbines will have on this highly sensitive mammal. The developer should not be surveying for oribi after the development is approved, it should have happened during the EIA phase.

Terrestrial Biodiversity Assessment:

The MTPA has significant reservations regarding the Terrestrial Assessment. Key concerns include:

- The terrestrial biodiversity theme is still not aligned with SANBI's Species Environmental Assessment Guideline (2022) that the consultant is required to comply with in terms of Notice 1150 of Government Gazette 43855 of 2020.

- The author only allowed for 4 days to survey both the Sheepmoor and Emvelo WEF sites during the summer months, when most summer rainfall plants would be flowering and identifiable. Four days is certainly not enough to cover an area this size (12,543 ha for both WEFs). This report is the same report as submitted with previous DEIA.
- No plant species of conservation concern, or endemics, were recorded on site. This is not surprising given the lack of time to survey this large area. ERM also opted to appoint a botanist not familiar with the flora of this area. There are several endemics restricted to this area that would be unfamiliar to someone not from the area. It just makes it harder to confirm identification, particularly with limited time and coverage in the field. **The MTPA is confident that several species of conservation concern would occur on site; they were just not detected**.
- The failure to apply the SANBI Guidelines resulted in inadequate time being allowed to properly assess the terrestrial biodiversity (botany) and the determining of site ecological importance (SEI). The consultant did not follow the SEI methodology, as required in terms of the SANBI guidelines and the MTPA does not believe that the approach followed to identify sensitive areas would be able to adequately assess the environmental sensitivity for this area. There were a number of additional variables that could have been applied (site-specific species, CBAs and ESAs, climate change corridors, intact grasslands, rocky ridges, etc.), patch size, together with criteria and approach of that are required in the SANBI Species Environmental Assessment Guidelines.
- The approach followed resulted in some CBA Irreplaceable areas, that overlapped with intact grasslands and provincial climate change corridors, being designated **medium** sensitivity (as a maximum value because it did not ultimately fall within the Eastern Highveld Grassland). This is fundamentally wrong as there was no consideration for any species of conservation concern (like roosting areas) or other spatial priorities like CBAs to meet biodiversity targets. Applying the SANBI criteria could allow the montane grassland to be categorised as *high*, or even *very high* if species and additional data were considered.
- In terms of the terrestrial biodiversity assessment, the result is that the montane grassland (not degraded) is of *medium* sensitivity, but the degraded Highveld grassland has *high* sensitivity, and non-degraded a *very-high* sensitivity. This does not make sense. We have significantly more threatened plant species recorded in the Wakkerstroom Montane Grassland than for the Eastern Highveld Grassland and consider far more sensitive.
- Ultimately, the MTPA does not agree with the vegetation sensitivity analysis that then fed into other planning processes, such as the offsets, as it did not apply SANBI's Species Environmental Assessment Guideline (2022).

2.4 Biodiversity Offset Report (BOR)

Firstly, the MTPA never requested a biodiversity offset report. When meeting with Mulilo many months ago, Mulilo mentioned they would offset their impacts, and even committed to developing an Oribi Biodiversity Management Plan. In reviewing the first DEIA, the MTPA merely commented that there were no BOR or Oribi management plans.

The MTPA appreciates the effort that has gone into compiling the draft Biodiversity Offset report, however the offset assessment and report only partly covers the residual biodiversity loss to sensitive areas, such as CBAs and Intact Grassland Areas, and not to the avifauna of conservation concern. The offset report should in fact explicitly assess whether any residual impacts affect irreplaceable biodiversity that cannot be offset, which will be a fatal flaw. In

addition, the MTPA feel that the anticipated negative impacts to long-lived threatened bird species cannot be adequately quantified nor offset.

The proposed BOR sets specific hectare targets for offsetting the direct loss of natural terrestrial habitats, particularly for areas supporting Species of Conservation Concern (SCC). These targets are based on biodiversity offset ratios, with a total of 507.15 hectares designated for offset, broken down by vegetation type and Mpumalanga Biodiversity Sector Plan (MBSP) category. The core of the terrestrial offset involves restoration efforts on disturbed and transformed areas within the study area. These areas include cultivated lands, disturbed Montane Grassland, disturbed Highveld Grassland, and alien invasive plantations. The aim of the BOR is to create additional habitat for Species of Conservation Concern (SCC), such as the Oribi, by restoring degraded grasslands.

The proposed offset strategy is partly aligned with the national offset strategy, however the formal legal security of the offset sites is incomplete. The BOR is certainly not clear how the site security will be guaranteed over the long term. Mulilo have lease agreements, and mention that servitudes or protected areas declaration may be pursued, but that does not meet the requirement of the offset guideline to do so and secure them. Mulilo proposes several internal onsite areas as offsets. These may not meet the requirements for a protected environment in a wind farm where avifaunal collisions occur. The MTPA will only consider offsets away from areas with turbines as possible protected environments. Hence there is no guarantee that the selected offset areas can ever be secured. Offsite offsets should have been identified and assessed in the report.

Furthermore, the candidate portfolio of offset sites is not provided in any detail. This shortfall is important as it is required for the competent authorities to assess any risks that cannot be offset. In addition, Mulilo commits to monitoring and adaptive management but alignment with the national offset guidelines do require specific biodiversity outcomes, monitoring indicators, success thresholds, and reporting plans.

The long-term financing mechanism and governance of the offsets are not discussed in any detail. It is important to secure long-term management funding (via a trust, endowment, etc.) and the governance arrangements, such as who will manage the sites, who will audit performance, etc.

The BOR also relies on rehabilitating disturbed areas; however, offsets should ideally be in relatively good condition (except for wetlands, which can be disturbed). Once grassland has been ploughed or planted up with trees, the biodiversity does not recover in our lifetime and restoration of these areas do not meet the biodiversity offset requirements.

The BOR includes offsite actions for priority bird species and avifauna buffer concepts, however, these must be converted into measurable outcomes (e.g., collision mortality reduction targets, powerline design/marking standards, and monitoring). Alignment with the national offset strategy requires species-sensitive responses be explicitly built into offset design when species with specific habitat needs are affected.

.

2.5 Cumulative Impacts

The concentration of renewable energy projects in Mpumalanga (890 turbines approved, in process, or planned), particularly along this sensitive escarpment, necessitates careful consideration of cumulative impacts. Each additional project contributes incrementally to regional habitat fragmentation and potential impacts on species

populations, especially avifauna. The avifaunal assessment states that the proposed Mulilo WEF, alongside three other renewable energy projects within a 35 km radius, would contribute to a total of 131 (incl. Sheepmoor). Sheepmoor's turbines represent approximately 21% of the total planned turbines, indicating a moderate to high cumulative impact. For Sheepmoor, the cumulative impacts on birds are rated as High pre-mitigation and Medium post-mitigation. Bearing in mind the very optimistic mitigation proposals, dependant on a multitude of models and processes, places the implementation at risk.

The MTPA was able to query its database on renewable energy projects and actual turbine locations to provide the following important statistics (based on approved, under-consideration, and planned wind farms). Please note that these stats include the current proposed Sheepmoor project's turbines within the numbers presented.

- *10 km radius*: 70 turbines (3 approved)
- *20 km radius*: 216 turbines (65 approved)
- *35 km radius*: 359 turbines (127 approved)

The actual number of turbines approved or in process of being approved is double that what the avifaunal specialist used in their calculations. Yes, their addition makes up a smaller percentage but it adds to the threshold beyond which avifauna populations(and bats) may start crashing. With every turbine added, the risk of collisions increases. As these turbines have not been built, the renewable energy industry, and government, do not fully comprehend the massive impact that the wind farms will have on the avifauna and bats and the need to preserve sensitive areas to ensure their long terms persistence.

2.6 Acknowledgement of recent change in landcover and impact on results

The delineation of the CBAs and intact grassland patches was based off a landcover map from 2010 and 2019 (but just for CBAs). Any subsequent loss or transformation is not a fault in the MBSP or intact grassland patches, but as a result of a legal or illegal change in land use. In the MBSP Handbook, the guidelines recommend that a site assessment is required to confirm the current land use. Any loss may require additional areas to meet targets (to be addressed in MBSP v2), while acknowledging that **the CBA status may no longer apply to these areas if they have been ploughed or developed** (where recovery is not possible within our lifetimes). Therefore, in terms of the Sheepmoor WEF, any change in land use from natural to cultivation or plantation would result in this particular area no longer being identified as a CBA or intact grassland patch.

.

3. Summary of Turbine Locations Requiring Reconsideration

Should DFFE proceed towards authorisation, we strongly recommend the exclusion of the turbines identified in below.

- WT 18: KBA, African Grass Owl buffer
- WT 21: KBA
- Wt 26: Intact Grassland Patch; NPAES, within 5.5km Martial Eagle buffer, IBA

- WT 27: Intact Grassland Patch, NPAES, within 5.5km Martial Eagle buffer, IBA
- WT 28: Intact Grassland Patch, NPAES, within Bald Ibis buffer, IBA
- WT 29: Intact Grassland Patch, Climate change corridor, NPAES, within Bald Ibis buffer, IBA
- WT 31: Intact Grassland Patch, Climate change corridor, NPAES
- WT 32: Intact Grassland Patch, Climate change corridor
- WT 33: Intact Grassland Patch, Climate change corridor, NPAES
- WT 34: Climate change corridor
- WT 36: Climate change corridor
- WT 40: Climate change corridor
- WT 41: Within Bald Ibis buffer
- WT 42: Climate change corridor
- WT 43: Intact Grassland Patch, Climate change corridor, NPAES,
- WT 44: Climate change corridor, NPAES
- WT 45: Climate change corridor, NPAES, CBA
- WT 46: Climate change corridor,
- WT 50: IBA
- WT 51: Climate change corridor, IBA,
- WT 52: Climate change corridor, NPAES, IBA
- WT 53: Climate change corridor, NPAES, IBA

4. Closing

In conclusion, **the MTPA maintains a strong objection to the proposed Sheepmoor WEF in its current form**. The site overlaps with highly sensitive and irreplaceable biodiversity features—including intact grassland patches, climate change corridors, Critical Biodiversity Areas, KBAs, IBAs, and NPAES priority expansion areas—supporting numerous threatened and endemic species. The avifaunal assemblage present, particularly threatened species such as the Martial Eagle, Black Harrier, Denham's Bustard, Cape Vulture, and African Grass Owl, places this site among the most sensitive in the province for wind energy development.

Our review identifies substantial flaws in the baseline data, methodological approaches, and statistical analyses used in the supporting specialist studies, particularly in the avifaunal assessment. Several models relied upon for impact prediction and mitigation zone delineation are unvalidated, contain spatial biases, or deviate from nationally recognised guidelines. Critical surveys, such as comprehensive Oribi assessments and adequate botanical surveys aligned with SANBI protocols, were not completed. As a result, sensitivity mapping, buffer zones, and mitigation recommendations cannot be considered robust or defensible.

The proposed mitigation measures—many novel, untested, and potentially unfeasible—are unlikely to adequately reduce the high to very high pre-mitigation risks to acceptable levels. Given the cumulative turbine density in the broader landscape, the unquantifiable long-term impacts on species with slow reproductive rates, and the loss of ecological connectivity, residual effects are expected to be severe and potentially irreversible.

In light of these factors, the MTPA concludes that the current turbine layout and offset strategy are fatally flawed from both a biodiversity conservation and environmental authorisation perspective. We recommend that authorisation be withheld and that any future proposal for this site be preceded by at least two full years of comprehensive, guideline-aligned monitoring; complete botanical and faunal surveys; and a layout that entirely avoids intact grasslands, key corridors, and critical habitats for species of conservation concern. Only a precautionary, science-based approach can ensure the long-term persistence of the biodiversity assets of this region.

Please do not hesitate to contact this office if there are any enquiries.

Hi Jamie,

Over and above we have also received comment from MTPA which does require Terrestrial biodiversity input. Kindly see attached these comments for your attention.

I do apologize for the short notice we have on this project, but we do intend to submit the final by the end of the week on the 22 Aug. Please do let me know if you can accommodate us with these comment responses?

Regards,

ERM

Hi Jamie,

Thank you for your support and delivering these reports at short notice. If you feel that these report updates were out of your scope and you would like to submit a change order, the client is open to it so please do share that with me.

I have attached the DARDLEA comments for your attention, I kindly require assistance with the with regards to comments directed to your specialism, notably 18.3 and 18.5.

If I could kindly request your assistance to argue your point on these grassland comments.

Kind Regards

ERM

EXTERNAL MESSAGE

Hi Lucien, here are the reports with the revised layouts replaced where applicable (the last few maps in the reports).

There is an overlap with the Emvelo/Sheepmoor boundary that was provided where a central area fall within both sites. I have not had time to figure out what's going on there or to scrutinise the layout to check if there are any changes that affect the outcome of the assessment.

Subject: Mulilo Amsterdam Final Layout - [12 AUG 225]

Dear Specialist,

I trust you are well.

Please find attached the final layout for the proposed Amsterdam WEF as received from the applicant. Kindly update your respective specialist reports to reflect this final layout, and to submit your revised reports by Monday, 12 August 2025.

If, for any reason, you anticipate that you will not be able to meet this deadline, please inform me as soon as possible so that we can explore alternative arrangements.

Thank you for your continued support and contributions to the project. Should you have any questions or require any additional information, please don't hesitate to reach out.

Kind regards,

Dear Ms. Gopaul

SUBJECT: MTPA'S COMMENTS ON THE DRAFT ENVIRONMENTAL AUTHORISATION APPLICATION FOR THE REVISED EMVELO WIND ENERGY FACILITY COMPRISING OF 24 WIND TURBINES AND AUXILIARY INFRASTRUCTURE. PROJECT FOR EMVELO WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE NUMBER: 14/12/16/3/3/2/2611.

1. INTRODUCTION

The Mpumalanga Tourism and Parks Agency (MTPA) has reviewed the application for the proposed Emvelo Wind Energy Facility (WEF) and associated infrastructure (Reference: 14/12/16/3/3/2/2611), dated 14 July 2025.

The MTPA notes the changes made, such as a revised layout with a reduced number of turbines (now up to 22) and a lower maximum output capacity of up to 240 MW. While these revisions were informed by additional studies identifying sensitive areas requiring avoidance, the modifications often merely shifted turbines into partially transformed areas, with blades and footprints still encroaching on sensitive habitats. These changes are not substantial enough to address our concerns, and the MTPA does not support the current proposed layout.

Key areas of concern include potential impacts on critical habitats such as intact grassland patches, Critical Biodiversity Areas, Important Bird Areas (IBA), climate change corridors, and National Protected Area Expansion Strategy (NPAES) zones; risks to avifauna, including numerous species of conservation concern; perceived shortcomings in specialist assessments and statistical methods; insufficiently tested mitigation measures, especially with respect to buffer zones; and the cumulative impacts within a region already facing significant development pressure.

2. CORE CONCERNS

2.1 Impacts on Sensitive Habitats

Intact Grassland Patches

Intact grassland patches allow species to thrive and to support species that may need to move in response to climate change, enabling the normal functioning of natural ecological processes such as fire regimes or pollination. These patches are typically larger than 100 ha, with little or no gaps and minimal edge effects, and occur in close proximity to other intact grassland patches. They function as "source areas" in metapopulation dynamics where birth rates exceed death rates. No significant impacts should be allowed that would change a source area into a sink area (where death rates exceed birth rates). Mpumalanga has only 1,039 intact grassland patches, covering 15% of the province. These areas have been prioritised for their connectivity importance and must be avoided by wind energy facilities.

The intact patches on Emvelo are critical for maintaining connectivity with other grasslands. Despite MTPA raising concerns, specialist reports were largely silent on their importance. Using over 80,000 bird observations, the MTPA confirmed that intact grasslands have a 22% higher likelihood of hosting birds of conservation concern, 49% more birds of conservation concern, and 98% more individual bird observations than non-intact grasslands. These patches make up 23% of the Emvelo WEF footprint, and six turbines (13, 19, 20, 22, 23, and 25) are located within them. These turbines should be removed.

The MTPA feels strongly that the establishment of wind farms in intact grassland patches should not be allowed as it may turn a "source" area into a "sink" area. Even Pages 3 and 4 of the Faunal assessment within the DEIA recognises that "*Faunal integrity relies on inter-connected grassland habitats across landscapes*." and "*…any contiguous areas of intact grassland are considered as high conservation importance*."

Figure 1: 3D map showing the location of the current turbines. Intact grassland patches are shown in green. Nest sites of threatened birds in red. In the current layout, there are still many turbines in the intact grassland patches.

Other Sensitive Spatial Areas:

Climate Change Corridors

The MBSP's climate change corridor network was designed to enable species and ecosystems to adapt to a changing environment. The corridor network considered a single-best (least-cost) corridor connecting up the climate change refugia with the climate change corridors from adjacent provinces. Additional fine-scale corridors were then identified using Circuitscape, finding alternative pathways and identifying pinch points in the corridors and thereby building resilience into the corridor network.

As can be seen from Figure 2, climate change corridor runs predominantly north-south through the project area, linking the climate change focal areas (as well as coincidentally the Grassland IBA with the Chrissies Pans IBA). Given that large birds do not fly in narrow, predictable lines, a flight corridor would need to be functionally broader than the MTPA provided fine-scale corridor. A broader macro-scaled corridor would be required for avifauna to ensure safe passage along the corridors. Maintaining this linkage is essential for long-term ecological resilience under climate change. The following turbines are within 500m of the climate change corridors and should be removed: 1, 4, 5, 7, and 25, as they would compromise this corridor.

The risk from the proposed wind farm on the corridor network is that the wind farm is unfortunately located along an important north-south macro regional flyway/corridor (also supported by vulture tracking data, Figure 9) which will result in increased collisions and electrocution, and habitat displacement. It stands to disrupt movement along the corridor and result in increased mortalities.

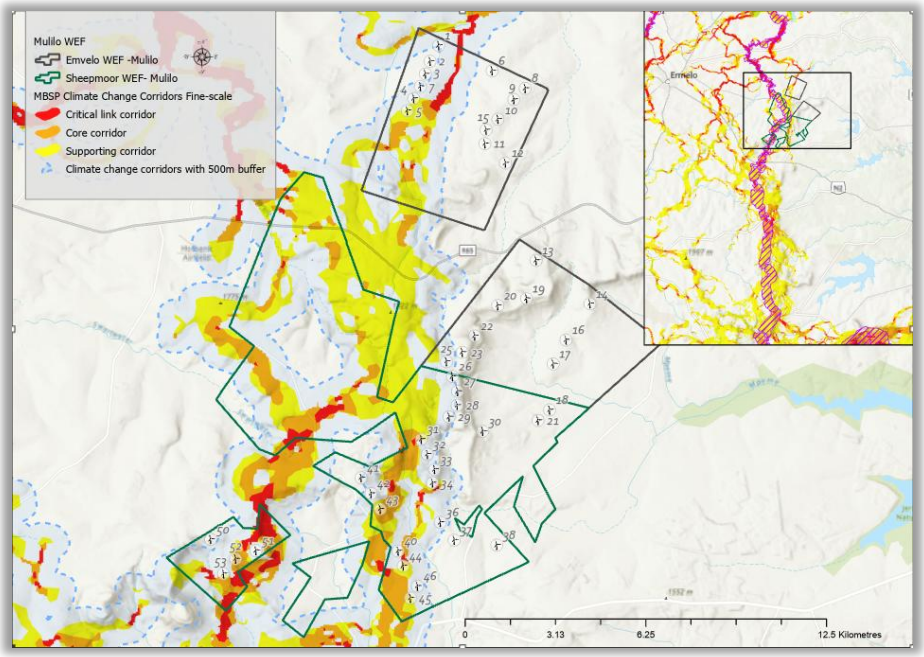

Figure 2: MBSP Climate Change Corridor network that links up climate change priorities with refugia and national climate change corridors. A 500m buffer has been added to the fine-scale corridors due to the need to accommodate mobile avifauna along a macro-scale corridor.

National Protected Area Expansion Strategy (NPAES 2018)

Over 70% of the proposed WEF falls within NPAES spatial priority areas, with 25% of turbines directly on focal areas. These sites are nationally significant for conservation expansion. Currently, seven turbines (13, 14, 19, 20, 22, 23, and 25) are located in NPAES zones and should be removed.

2.2 Avifaunal Risks and Buffer Zones

The site's recognised avian biodiversity, including numerous sensitive and threatened species, necessitates a highly precautionary approach to impact assessment and mitigation. Many of the proposed mitigation measures are novel, untested, and costly. We don't believe the developer has adequately considered the costs of implementing all the recommended mitigation (and curtailment) measures on the success of this project, nor the chances of their efficient implementation (as they rely on models, people, expertise, budgets, and commitment).

Important Bird Areas (IBAs) and IUCN Key Biodiversity Araes (KBAs)

The proposed WEF falls in an area rich in bird species, particularly birds of conservation concern. Thirty-two priority bird species for wind energy development have been recorded within the WEF and broader area. An additional seventy-six species have been recorded which are powerline sensitive. Of particular concern are the occurrence of African Grass Owl (VU), African Marsh-Harrier (EN), Black Harrier (EN), Blue Crane (VU), Blue Korhaan (NT), Cape Vulture (EN), Denham's Bustard (VU), Grey Crowned Crane (EN), Lanner Falcon (VU), Martial Eagle (EN), Secretarybird (EN), Southern Bald Ibis (VU), White-bellied Bustard (VU), and Yellow-breasted Pipit (VU). These are all threatened bird species at risk of extinction, over various timeframes. This rich avifaunal biodiversity is recognised regionally and globally through its inclusion within IBAs and KBAs. IBAs make up 49% and KBAs 65% of the Emvelo WEF.

At the heart of the MTPA's concerns, resulting in our objection, is the rich avifaunal diversity that is at risk of continual loss of mature individuals through collisions and electrocutions.

The avifaunal specialist report acknowledges that collision can be reduced from a high to a medium impact following post-mitigation. However, **with 14 threatened bird species occurring on site**, reducing the impact to a medium level is still significant (if at all possible), as any loss of large individuals may impact the conservation status of these species, particularly in light of cumulative impacts from the 302 planned or approved, and 82 approved wind turbines within 35 km of Emvelo WEF. Additionally, the avifaunal specialist report assessed the cumulative impact of Emvelo WEF to be moderate to high.

BirdLife monitoring report of 2025 states that on average, for every turbine, there are 4.25 bird fatalities per year, and that 10% of these were species of conservation concern. With every turbine added, the risk of collisions increases.

White-winged Flufftail **(**Critically Endangered**)**

- Collision risk modelling results for White-winged Flufftail yielded a mean annual fatality rate of 1.54 birds/year with the original wind turbine layout, which was reduced to 0.45 birds/year with implemented avoidance of core (highly suitable) habitats. For a Critically Endangered species, with only a handful of known localities in South

Africa, we cannot afford to lose 1 bird every 2 years for the next 25 years. This would certainly push this species closer to extinction. This risk is too high.

- The February reports explicitly states a 250 m buffer around White-winged Flufftail habitat, defined through detailed habitat modelling. The July reports mention that White-winged Flufftail habitat is "appropriately buffered" and that "movement corridors were determined and buffered," but the report does not explicitly state a numerical value for this buffer.
- The developer commits to implementing dynamic, real-time nocturnal curtailment i.e., from dawn to dusk for the duration of the summer season, for all wind turbines located within the modelled medium risk zone and traversing White-winged Flufftail habitat connectivity corridors. The following turbines are affected: 26, 27, 28, 29, 31, 44 and 45.
- Of greater concern is the fact that **White-winged Flufftail has been recorded on site although there is scant mention of it**. There is reference to being recorded in the Avifaunal assessment on Page ii, 19, and 21. Its occurrence on site is significant and a fatal flaw.
- BirdLife (Lloyd et al. 2025) distinguishes between *habitat buffer* zones and *species buffer* zones for White-winged Flufftail. Habitat buffer zones maintain ecosystem functions and processes that the species rely on, while species buffer zones protect and maintain the biological needs of a particular species.
- BirdLife published a guideline (Lloyd et al. 2025) for developments with collision risks, like wind turbines, **with buffer zones of at least 5 km between the development and wetlands suitable for the White-winged Flufftail**, with buffer zones of at least 1 km for delineated wetland inputs (habitat buffers). Importantly, the buffers proposed in the avifaunal report equate to the habitat buffers while the species buffer was not implemented. This is a fatal flaw.
- The occurrence of White-winged Flufftail on Emvelo is also confirmed within the Draft REDZ layer on nests, tracking data, roosts and sightings. These points were buffered for the REDZ project, but one can easily find the wetlands within this buffer. This point won't be provided here, to protect the locality, but I buffered this point, and an adjacent one, by 5 km and the result excludes a significant amount of the Emvelo WEF. See Figure 3 below.

African Grass Owl

- African Grass Owl (*Tyto capensis*), a regionally Vulnerable species, has been recorded on Emvelo WEF in the east. These endemic and range-restricted owls have a very small home range of 423 ha (Pretorius 2019). To avoid any impacts to these sites, Pretorius *pers. comm.* recommends this home range be converted to a radius of a circle of 423 ha in size. This equates to a 1160 m buffer. By applying these to the known observations on Emvelo, it affects the placement of turbines 17 (Emvelo) and 18 (Sheepmoor). These localities are buffered and mapped in Figure 4.

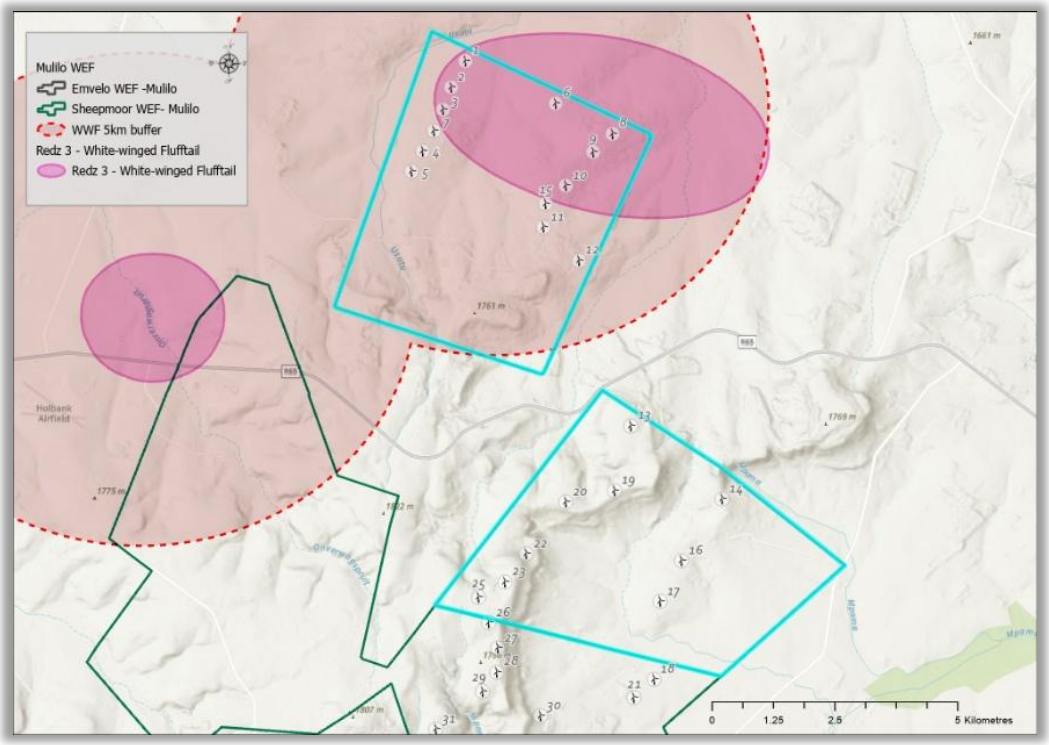

Figure 3: Confirmed White-winged Flufftail within Emvelo WEF, with REDZ 3 locality from Avifaunal risk layer and with point locality buffered by 5 km as a no go to development zone (Lloyd et al. 2025).

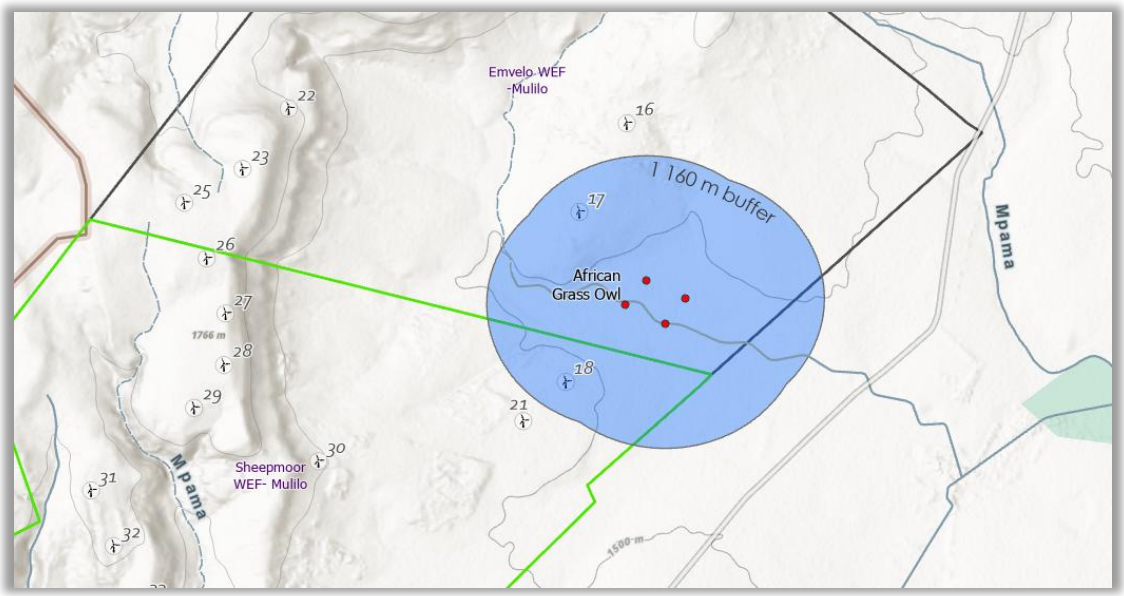

Figure 4: African Grass Own (Vulnerable) localities with the recommended 1160 m buffer to cover their strict home range of 423 ha.

Avifaunal assessment for draft Strategic Environmental Assessment for Phase 3 For Wind and Solar Photovoltaic Energy

The MTPA received the REDZ datasets from the CSIR in May for comment. These datasets may still be refined, but they represent the best available avifaunal data that will eventually inform the DFFE screening tool. Although still a draft product, the dataset is based off actual data and the MTPA believe it to be a significant improvement in the data currently available to evaluate renewable energy applications. Querying this dataset, besides the Critically Endangered White-winged Flufftail being present within the Emvelo footprint, the following important avifaunal datasets cover Emvelo (Table 1). The spatial extent these features is mapped in Figure 5.

Table 1: List of REDZ species and their risk and conservation status occurring over Emvelo and Sheepmoor WEFs.

Species	Risk	RDL Status
African Grass Owl	High	Vulnerable
Cape Vulture	Medium	Endangered (Regionally)
Grey Crowned Crane	High	Endangered
Rudds Lark	High	Endangered
Secretarybird	Very High	Endangered (globally)
Southern Bald Ibis	Very High	Vulnerable
White-winged Flufftail	Very High	Critically Endangered
Wattled Crane	High	Critically Endangered
Yellow breasted Pipit	Very High	Vulnerable

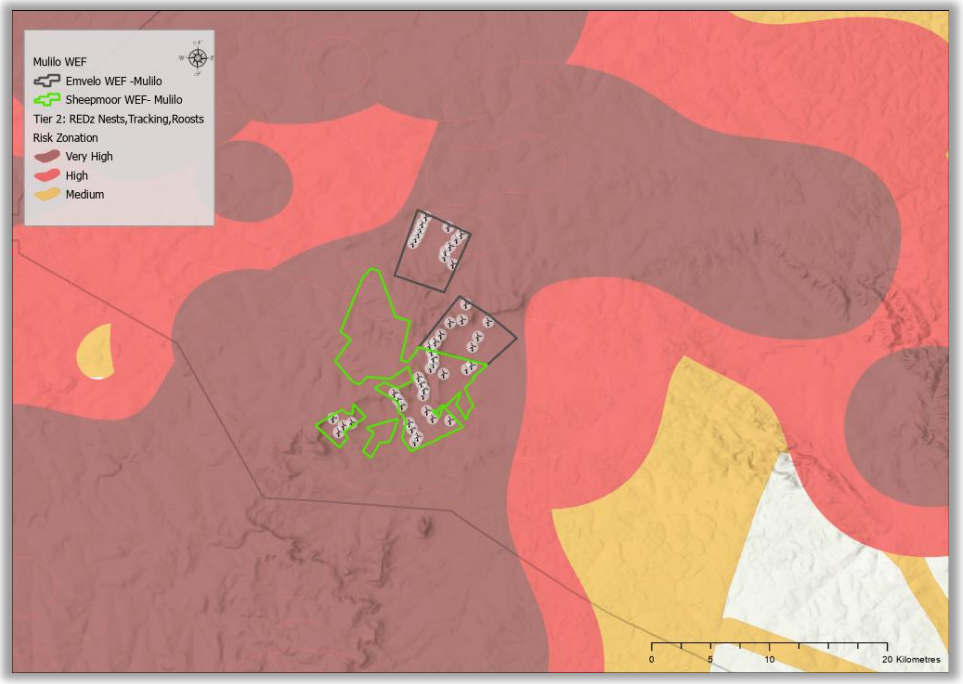

Figure 5: Spatial extent of the Tier 2 draft SEA REDZ 3 avian sensitivity layer covering Emovelo and Sheepmoor WEFs.

Buffers: Martial Eagle

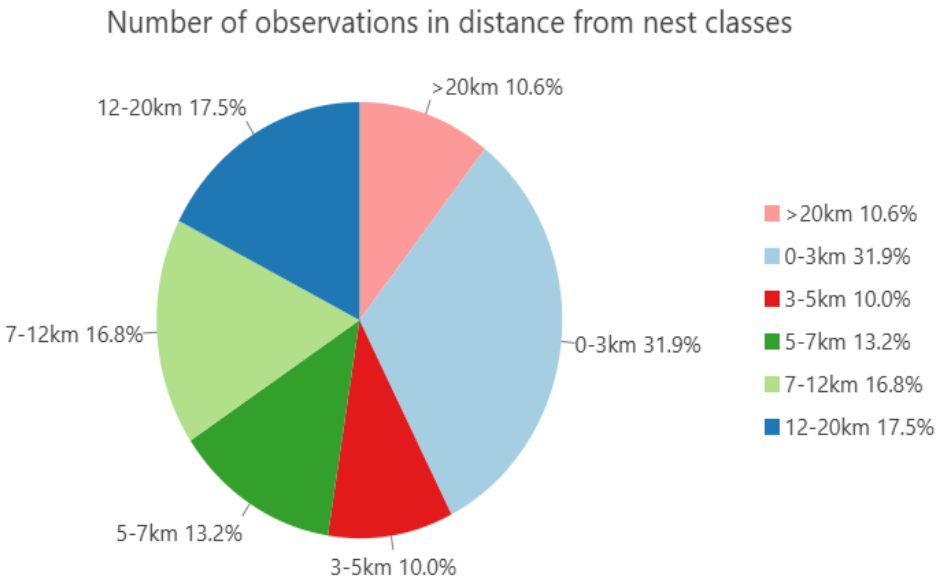
The MTPA has significant concerns regarding the use and modelling of Martial Eagle collar data. The MTPA obtained a copy of the flight data containing 13,111 observation points, compared to the 13,680 observations used by AfriAvian. We used GIS to confirm key findings in the avifaunal assessment, focusing only on data from juvenile and adult tracking collars around the Emvelo and Sheepmoor sites, excluding the Free State male.

EWT previously advised using a 5-6 km buffer around nest sites. More recently, BirdLife (2025) recommended a 6 km buffer around nesting sites. This recommendation aligns with preliminary outputs from the National Martial Eagle Risk Assessment (MERA) tool led by the University of Cape Town, which supports applying a circular buffer of approximately 5 km to include core ranges heavily utilised by resident breeding Martial Eagles, rather than applying bespoke buffers based on tracking and observational flight path data. Given 40 individual collared Martial Eagle tracking datasets, researchers could not build a reliable model to guide wind farm development, as Martial Eagles appear particularly difficult to model for flight patterns.

Against this backdrop, it is concerning that AfriAvian claimed they could accurately model flight risk for Martial Eagles and were confident enough to reduce the nationally recommended buffer by more than 50% (to 2.5 km for the High Risk zone). Such confidence in model output would be required to make this bold decision, as any failure may result in the loss of both parents and the entire breeding pair.

AfriAvian's Approach: AfriAvian combined all GPS tracking data with fine-resolution field monitoring data (37+ hours of observations) to develop a Flight Risk Model. The output was processed to identify High and Medium risk zones. The High risk zone encompassed approximately 79 km², comparable to the area covered by a 5 km circular buffer (78.5 km²) recommended by BirdLife and EWT. However, AfriAvian then extracted from the High risk zone a "Very High risk zone" as their no-go area, relying on Martial Eagle tracking and observational data showing approximately 75% of recorded flight activity within 3 km of the nest. This was not only a subjective decision lacking scientific rigour, but as demonstrated below, the approach is fatally flawed.

Statistical Flaws in the Model: The flight risk model created using machine learning combined coarse-scaled GPS data across a wide area with fine-scaled, dense flight path data from a very limited area (majority within 2 km of nest) (see Figure 18 in the avifaunal assessment). Incorporating detailed, fine-scaled observational flight paths from such a limited area introduces spatial bias, where model output is disproportionately influenced by the more detailed sampling from the fine-resolution area, leading to overrepresentation of that smaller region.



This approach is statistically flawed when differences in spatial area, resolution, sampling intensity, and density are not properly accounted for. This violates spatial statistical assumptions, resulting in inconsistent variance estimates, inaccurate predictions, and biased interpretations that do not accurately reflect broader spatial patterns.

MTPA Analysis and Findings: The MTPA used the same GPS tracking data to verify whether Martial Eagles spent 75% of their recorded flight activity within 3 km of the nest but could not replicate this statistic. We calculated the distance between each GPS observation (n=7266) and the nest, we then categorised each observation into the same distance classes that AfrAvian used in Figure 22 of their report. We used only flight data from the adult female and juvenile in this area, discarding Free State data (nest location unknown).

Importantly, we separated data into two types: (1) the complete dataset covering flying and stationary periods, and (2) a subset including only flying periods (>0.2 km/h). The second dataset was considerably smaller. Although collar tracking was programmed not to record locations between 19:00 and 4:00, 20% of observations were still recorded at before sunrise or after sunset. For flight risk modelling, only observations when birds are flying and at collision risk should be included, not when roosting, nesting, or perched.

We calculated the distance within which 75% of all observations occurred for the full dataset (including evening and nesting periods), finding a distance threshold of 5.6 km. For the flying-only dataset, this distance increased to 13.5 km (see Figures 6 and 7).

For AfriAvian to get to a value of 75% for all observations within 3km of the nest, they must have (1) used all the flight data, including the datasets that were only recorded at the nest (introducing spatial bias and a statistical flaw), (2) they must have used all the observational data, including when the bird was stationary and sitting on a nest, and (3) a different statistical approach to analysing the data. Regardless, our analysis provides a markedly different outcome, aligned with the 5-6 km buffer recommended by EWT and BirdLife, and invalidates the 2.5 km buffer proposed by Mulilo for the High Risk zone. This High Risk zone should be removed as there is no statistical confidence in its delineation, potentially putting birds at collision risk.

Distance from nest class	Flying only localities	Flying / Stationary localities
0-3km	31.9%	58.6%
3-5km	41.9%	60.8%
5-7km	55.1%	77.9%
7-12km	71.9%	85.3%
12-20km	89.4%	95.3%
>20km	100.0%	100.0%

Figure 6: Pie chart showing the number of Martial Eagle observations/points within distance classes from Martial Eagle nest. The table on the right presents the cumulative value of the distance classes, for the entire combined dataset, or with only the localities where the Martial Eagle were flying (>0.2 km/h). Results show that for the entire dataset of 7 266 points, 75% of the observations were within 5.6 km of the nest, while for the flying Martial Eagles, 75% of the records were within 13.5 km of the nest.

Figure 7: Bar-chart showing the number of observations from the collar tracking data in distance classes as used in Figure 22 of avifaunal report. Top-most chart presents all the observations (n=7266) for the adult and juvenile Martial Eagles. The middle chart presents only the observations where the Martial Eagles were flying (n=1122) in distance classes from nest. Bottom chart presents the combined datasets for both juvenile and adult birds in distance classes from nest. Bar chart bars are labelled with actual number of records in each class.

Breeding Cycle Considerations: Martial Eagles display significant differences between breeding and non-breeding periods. They typically breed every second year; therefore, a minimum of two years of data is essential when considering range use to capture both intensive breeding seasons and "sabbatical" periods when Martial Eagles often utilise larger ranges away from nesting sites. The GPS records for both birds covered 1 year and 1 month (10 April 2024 to 9 May 2025), meaning AfriAvian's analysed data did not cover a full two-year cycle.

Adult female Martial Eagles utilise home ranges differently than males, who spend considerable time hunting and provisioning for incubating partners and developing nestlings. During core breeding periods, females exhibit much higher nest site fidelity while males forage extensively over larger ranges. Females typically do not fly as far as males during core breeding seasons; therefore, the exclusion and lack of buffers considering male Martial Eagle range use is concerning. The conclusions did not factor in male flight activity, range use, and flight paths over the Mulilo project area.

Mitigation Concerns: Proposed mitigation measures include curtailment for Martial Eagle flights. However, the avifaunal report found that Martial Eagles are most active at moderate wind speeds of 5.5-10 m/s. Curtailment would significantly impact turbine power generation capacity, and we believe these costs were not considered in assessing the viability of proposed mitigation measures.

With the 5.5 km circular buffer being the current recommended buffer around Martial Eagle nests, the application of a 5.5 km buffer will result in the removal of 16 turbines, namely: 4, 5, 7, 9, 10, 11, 12, 13, 14, 15, 16, 19, 20, 22, 23, and 25. See Figure 8 below.

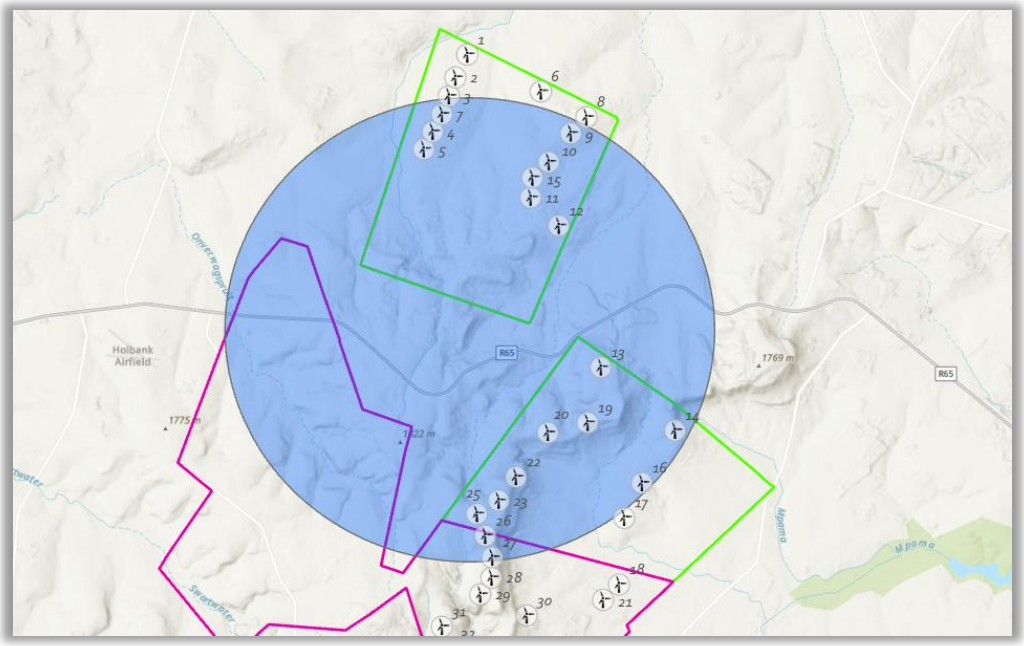


Figure 8: Application of a 5.5 km buffer around the Martial Eagle nest site and the impacted wind turbines.

Avifaunal Assessment: 2 -year of vantage point monitoring required and overreliance of models

Given the site's avifaunal sensitivity, two years of comprehensive avifaunal monitoring would be required. While we understand an additional year was added to monitor the Martial Eagle, this did not include visiting all vantage points as required by BirdLife guidelines. Figure 19 in the Avifaunal assessment shows the limited extent of this additional monitoring, which was confined to the Martial Eagle nest site. Such sensitive and vulnerable avifauna requires more comprehensive monitoring to properly understand and assess potential impacts.

Modelling is used throughout the project sites, from the identification of suitable habitat to avoid, through to predicting where Southern Bald Ibis is likely to fly once leaving a roost, to mitigating impacts. AfriAvian's flamingo model for Leghoya WEF was found to miss 50% of the important pans supporting flamingos (based on actual sightings). We highlight above the spatial bias that was introduced into the Martial Eagle Flight Risk Model, and the inability to replicate and confirm that 75% of the recorded flight activity is within 75% of the nest. George P. Box famously once said "*All models are wrong, but some are useful*". We need to be careful on our reliance on models.

There is an increasing tendency to over rely on models, perhaps because they sound to sophisticated, to mitigate and minimise all possible impacts to acceptable levels. This is wrong. Unless models can be validated with data that was withheld, or gathered afterwards, we need to approach models with caution. Models may be acceptable when they refine boundaries of established circular buffers, but they become problematic when they result in 50% reductions in buffer boundaries without validation or peer review. Our detailed analysis of the Martial Eagle model revealed several critical flaws, as discussed above.

As a result of these repeated issues with model accuracy and validation, the MTPA has become increasingly distrustful of models as primary decision-making tools for sensitive environmental assessments. Robust field monitoring and established precautionary guidelines must take precedence over unvalidated modelling outputs.

Cape Vulture flyways

Cape Vultures are globally vulnerable and regionally endangered. The specialist assessment did observe Cape Vultures over the project area for 48 minutes over 756 hours, and within the rotor swept zone. This amounts to 1 vulture visit every 2 weeks. According to the vantage point priority bird monitoring statistics, Cape Vultures were the 7th most observed priority species (out of 23) over the 1 year of observation.

In the recent Birdlife summary report from monitoring operational wind energy facilities (2025), it provides a case study of a wind farm that recorded a very low numbers of Cape Vultures during pre-construction monitoring (recorded in less than 1% of total vantage point surveys), yet later in the year, once operational, the wind farm had shutdowns involving 384 Cape Vultures. This highlights the need for impact assessments to incorporate all sources of information, and to be careful of initial low observations during pre-construction monitoring.

The MTPA queried the Cape Vulture flight paths on Movebank.org early in April 2025 – See Figure 9 (Kruger NP Raptors E-obs (n=18); Vulpro (Rehab & Captive bred) (n=123); & EWT SigFox Vultures (n=18)) to create the below map showing Cape Vulture flight paths based on density of observations in Movebank.org. This data in Figure 9 clearly shows a north-south flightpath that connects the northern Mpumalanga Escarpment with KwaZulu Natal in the south. And with the

specialist reported observation that the vultures fly within the rotor swept zone, we are very concerned about the risk that the wind farm may pose to vultures as they fly through this corridor. This corridor impacts all the proposed wind turbines.

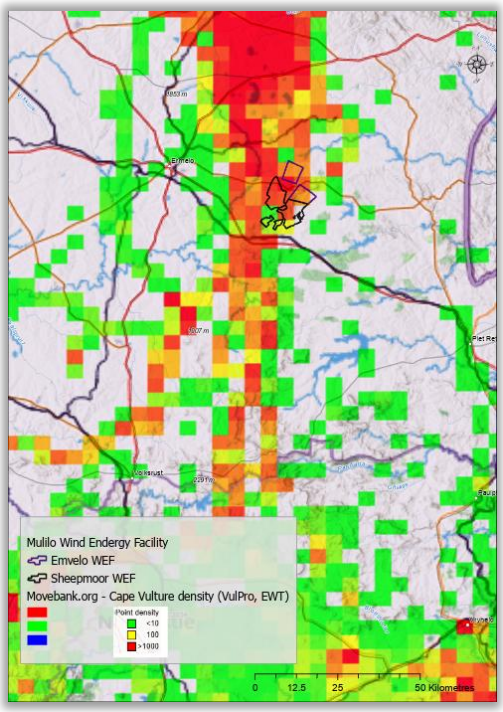

Figure 9: Tracking data from Cape Vultures flying over the Emvelo and Mulilo WEFs. Data sourced from Movebank.org in April 2025. Data source VulPro, EWT. Symbology represents density of recorded points. Red = high density.

Vantage Point Monitoring

Based on the latest and current turbine layout, 5 out of the 22 turbines are not covered by the 2 km vantage point buffers, amounting to 23% of turbines not been covered.

2.3 Specialist Assessments - other

While extensive specialist work has been undertaken, MTPA notes areas where further information or methodological alignment could strengthen the overall environmental assessment.

General

Enhanced integration between the aquatic, faunal, bat, terrestrial and avifaunal assessments is recommended to better understand potential synergistic or cumulative biological impacts.

Faunal Specialist Assessment

Placement of infrastructure in high/very high sensitivity areas warrants careful justification given specialist recommendations to avoid these areas. While we acknowledge the inclusion of a detailed oribi management plan, no detailed oribi survey of this area has occurred, nor is a map of oribi habitat or oribi observations included. Its inclusion at this late stage is only in response to issues raised in the Draft EIA report. Although it is possible that an oribi management plan could improve the local status of the oribi within the footprint area, it can also be said that the failure to adequate survey for oribi since this was raised in the scoping report stage (meeting), means that the proposed development may have a significant negative impact on the oribi. How do we know that turbines, roads, or infrastructure will not be placed in core habitat for oribi? The MTPA has reached out to EWT and they do not know what impact wind turbines will have on this highly sensitive mammal. The developer should not be surveying for oribi after the development is approved, it should have happened during the EIA phase.

Terrestrial Biodiversity Assessment:

The MTPA has significant reservations regarding the Terrestrial Assessment. Key concerns include:

- The terrestrial biodiversity theme is still not aligned with SANBI's Species Environmental Assessment Guideline (2022) that the consultant is required to comply with in terms of Notice 1150 of Government Gazette 43855 of 2020.
- The author only allowed for 4 days to survey both the Sheepmoor and Emvelo WEF sites during the summer months, when most summer rainfall plants would be flowering and identifiable. Four days is certainly not enough to cover an area this size (12,543 ha for both WEFs). This report is the same report as submitted with previous DEIA.
- No plant species of conservation concern, or endemics, were recorded on site. This is not surprising given the lack of time to survey this large area. ERM also opted to appoint a botanist not familiar with the flora of this area. There are several endemics restricted to this area that would be unfamiliar to someone not from the area. It just makes it harder to confirm identification, particularly with limited time and coverage in the field. **The MTPA is confident that several species of conservation concern would occur on site; they were just not detected**.
- The failure to apply the SANBI Guidelines resulted in inadequate time being allowed to properly assess the terrestrial biodiversity (botany) and the determining of site ecological importance (SEI). The consultant did not follow the SEI methodology, as required in terms of the SANBI guidelines and the MTPA does not believe that the approach followed to identify sensitive areas would be able to adequately assess the environmental sensitivity for this area. There were a number of additional variables that could have been applied (site-specific species, CBAs and ESAs, climate change corridors, intact grasslands, rocky ridges, etc.), patch size, together with criteria and approach of that are required in the SANBI Species Environmental Assessment Guidelines.
- The approach followed resulted in some CBA Irreplaceable areas, that overlapped with intact grasslands and provincial climate change corridors, being designated **medium** sensitivity (as a maximum value because it did not ultimately fall within the Eastern Highveld Grassland). This is fundamentally wrong as there was no consideration for any species of conservation concern (like roosting areas) or other spatial priorities like CBAs to meet biodiversity targets. Applying the SANBI criteria could allow the montane grassland to be categorised as *high*, or even *very high* if species and additional data were considered.
- In terms of the terrestrial biodiversity assessment, the result is that the montane grassland (not degraded) is of *medium* sensitivity, but the degraded Highveld grassland has *high* sensitivity, and non-degraded a *very-high*

sensitivity. This does not make sense. We have significantly more threatened plant species recorded in the Wakkerstroom Montane Grassland than for the Eastern Highveld Grassland and consider far more sensitive.

- Ultimately, the MTPA does not agree with the vegetation sensitivity analysis that then fed into other planning processes, such as the offsets, as it did not apply SANBI's Species Environmental Assessment Guideline (2022).

2.4 Biodiversity Offset Report (BOR)

Firstly, the MTPA never requested a biodiversity offset report. When meeting with Mulilo many months ago, Mulilo mentioned they would offset their impacts, and even committed to developing an Oribi Biodiversity Management Plan. In reviewing the first DEAI, the MTPA merely commented that there were no BOR or Oribi management plans.

The MTPA appreciates the effort that has gone into compiling the draft Biodiversity Offset report, however the offset assessment and report only partly covers the residual biodiversity loss to sensitive areas, such as CBAs and Intact Grassland Areas, and not to the avifauna of conservation concern. The offset report should in fact explicitly assess whether any residual impacts affect irreplaceable biodiversity that cannot be offset, which will be a fatal flaw. In addition, the MTPA feel that the anticipated negative impacts to long-lived threatened bird species cannot be adequately quantified nor offset.

The proposed BOR sets specific hectare targets for offsetting the direct loss of natural terrestrial habitats, particularly for areas supporting Species of Conservation Concern (SCC). These targets are based on biodiversity offset ratios, with a total of 507.15 hectares designated for offset, broken down by vegetation type and Mpumalanga Biodiversity Sector Plan (MBSP) category. The core of the terrestrial offset involves restoration efforts on disturbed and transformed areas within the study area. These areas include cultivated lands, disturbed Montane Grassland, disturbed Highveld Grassland, and alien invasive plantations. The aim of the BOR is to create additional habitat for Species of Conservation Concern (SCC), such as the Oribi, by restoring degraded grasslands.

The proposed offset strategy is partly aligned with the national offset strategy, however the formal legal security of the offset sites is incomplete. The BOR is certainly not clear how the site security will be guaranteed over the long term. Mulilo have lease agreements, and mention that servitudes or protected areas declaration may be pursued, but that does not meet the requirement of the offset guideline to do so and secure them. Mulilo proposes several internal onsite areas as offsets. These may not meet the requirements for a protected environment in a wind farm where avifaunal collisions occur. The MTPA will only consider offsets away from areas with turbines as possible protected environments. Hence there is no guarantee that the selected offset areas can ever be secured. Offsite offsets should have been identified and assessed in the report.

Furthermore, the candidate portfolio of offset sites is not provided in any detail. This shortfall is important as it is required for the competent authorities to assess any risks that cannot be offset. In addition, Mulilo commits to monitoring and adaptive management but alignment with the national offset guidelines do require specific biodiversity outcomes, monitoring indicators, success thresholds, and reporting plans.

The long-term financing mechanism and governance of the offsets are not discussed in any detail. It is important to secure long-term management funding (via a trust, endowment, etc.) and the governance arrangements, such as who will manage the sites, who will audit performance, etc.

The BOR also relies on rehabilitating disturbed areas; however, offsets should ideally be in relatively good condition (except for wetlands, which can be disturbed). Once grassland has been ploughed or planted up with trees, the biodiversity does not recover in our lifetime and restoration of these areas do not meet the biodiversity offset requirements.

The BOR includes offsite actions for priority bird species and avifauna buffer concepts, however, these must be converted into measurable outcomes (e.g., collision mortality reduction targets, powerline design/marking standards, and monitoring). Alignment with the national offset strategy requires species-sensitive responses be explicitly built into offset design when species with specific habitat needs are affected.

2.5 Visual Impact

Page 134 in the DEIA states that the visual analysis of the Emvelo project was found to be fatally flawed.

2.6 Cumulative Impacts

The concentration of renewable energy projects in Mpumalanga (890 turbines approved, in process, or planned), particularly along this sensitive escarpment, necessitates careful consideration of cumulative impacts. Each additional project contributes incrementally to regional habitat fragmentation and potential impacts on species populations, especially avifauna. The avifaunal assessment states that the proposed Emvelo WEF, alongside three other renewable energy projects within a 35 km radius, would contribute to a total of 133 turbines in similar habitat. Emvelo's turbines represent approximately 18% of the total planned turbines, indicating a moderate to high cumulative impact. For Emvelo, the cumulative impacts on birds are rated as High pre-mitigation and Medium post-mitigation. Bearing in mind the very optimistic mitigation proposals, dependant on a multitude of models and processes, places the implementation at risk.

The MTPA queried its database on renewable energy projects and actual turbine locations to provide the following important statistics (based on approved, under-consideration, and planned wind farms). Please note that these numbers include the current proposed Emvelo project's turbines within the numbers that are presented.

- *10 km radius*: 57 turbines (none approved)
- *20 km radius*: 107 turbines (2 approved)
- *35 km radius*: 302 turbines (82 approved)

The actual number of turbines approved or in process of being approved is double that what the avifaunal specialist used in their calculations. Yes, the Emvelo addition would make up a smaller percentage but it adds to the threshold beyond which avifauna populations(and bats) may start crashing. With every turbine added, the risk of collisions increases. As these turbines have not been built, the renewable energy industry and government, do not fully comprehend the massive impact that the wind farms will have on the avifauna and bats and the need to preserve sensitive areas to ensure their long terms persistence.

2.7 Acknowledgement of recent change in landcover and impact on spatial mapping products

The delineation of the CBAs and intact grassland patches was based off a landcover map from 2010 and 2019 (but just for CBAs). Any subsequent loss or transformation is not a fault in the MBSP or intact grassland patches, but as a result of a legal or illegal change in land use. In the MBSP Handbook, the guidelines recommend that a site assessment is required to confirm the current land use. Any loss may require additional areas to meet targets (to be addressed in MBSP v2), while acknowledging that **the CBA status may no longer apply to these areas if they have been ploughed or developed** (where recovery is not possible within our lifetimes). Therefore, in terms of the Emvelo WEF, any change in land use from natural to cultivation or plantation would result in this particular area no longer being identified as a CBA or intact grassland patch.

The impact of this has been considered when commenting on turbine placement and those that need to be removed.

3. Summary of Turbine Locations Requiring Reconsideration

Should DFFE proceed towards authorisation, we strongly recommend the exclusion of the turbines identified in below.

- WT 1: KBA, Climate change corridor, within 5km of White-winged Flufftail,
- WT 2: KBA, Within 5km of White-winged Flufftail,
- WT 3: KBA, Within 5km of White-winged Flufftail,
- WT 4: KBA, Climate change corridor, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest.
- WT 5: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 6: KBA, within 5km of White-winged Flufftail,
- WT 7: KBA, CBA, climate change corridor, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 8: KBA, within 5km of White-winged Flufftail,
- WT 9: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 10: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 11: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 12: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 13: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 14: IBA, NPAES, within 5.5 km of Martial Eagle nest
- WT 15: KBA, within 5km of White-winged Flufftail, within 5.5 km of Martial Eagle nest
- WT 16: KBA, IBA, Within 5.5 km of Martial Eagle nest
- WT 17: KBA, IBA, Within African Grass Owl buffer
- WT 19: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 20: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 22: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 23: IBA, Intact grasslands, NPAES, within 5.5 km of Martial Eagle nest
- WT 25: IBA, Intact grasslands; climate change corridor, NPAES, within 5.5 km of Martial Eagle nest

4. Closing

In conclusion, the MTPA maintains a strong objection to the proposed Emvelo WEF in its current form. The site overlaps with highly sensitive and irreplaceable biodiversity features—including intact grassland patches, climate change corridors, Critical Biodiversity Areas, KBAs, IBAs, and NPAES priority expansion areas—supporting numerous threatened and endemic species. The avifaunal assemblage present, particularly threatened species such as the White-winged Flufftail, Martial Eagle,

Black Harrier, Denham's Bustard, Cape Vulture, and African Grass Owl, places this site among the most sensitive in the province for wind energy development.

Our review identifies substantial flaws in the baseline data, methodological approaches, and statistical analyses used in the supporting specialist studies, particularly in the avifaunal assessment. Several models relied upon for impact prediction and mitigation zone delineation are unvalidated, contain spatial biases, or deviate from nationally recognised guidelines. Critical surveys, such as comprehensive Oribi assessments and adequate botanical surveys aligned with SANBI protocols, were not completed. As a result, sensitivity mapping, buffer zones, and mitigation recommendations cannot be considered robust or defensible.

The proposed mitigation measures—many novel, untested, and potentially unfeasible—are unlikely to adequately reduce the high to very high pre-mitigation risks to acceptable levels. Given the cumulative turbine density in the broader landscape, the unquantifiable long-term impacts on species with slow reproductive rates, and the loss of ecological connectivity, residual effects are expected to be severe and potentially irreversible.

In light of these factors, the MTPA concludes that the current turbine layout and offset strategy are fatally flawed from both a biodiversity conservation and environmental authorisation perspective. We recommend that authorisation be withheld and that any future proposal for this site be preceded by at least two full years of comprehensive, guideline-aligned monitoring; complete botanical and faunal surveys; and a layout that entirely avoids intact grasslands, key corridors, and critical habitats for species of conservation concern. Only a precautionary, science-based approach can ensure the long-term persistence of the biodiversity assets of this region.

Please do not hesitate to contact this office if there are any enquiries.

Dear Ms. Gopaul

SUBJECT: MTPA COMMENTS ON THE DRAFT ENVIRONMENTAL AUTHORISATION APPLICATION FOR THE REVISED SHEEPMOOR WIND ENERGY FACILITY (WEF) FOR SHEEPMOOR WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE: 14/12/16/3/3/2/2613.

1. INTRODUCTION

The Mpumalanga Tourism and Parks Agency (MTPA) has reviewed the application for the proposed Sheepmoor Wind Energy Facility (WEF) and associated infrastructure (Reference: 14/12/16/3/3/2/2611), dated 14 July 2025.

The MTPA notes the changes made, such as a revised layout with a reduced number of turbines (now up to 25) and a lower maximum output capacity of up to 240 MW. While these revisions were informed by additional studies identifying sensitive areas requiring avoidance, the modifications often merely shifted turbines into partially transformed areas, with blades and footprints still encroaching on sensitive habitats. These changes are not substantial enough to address our concerns, and the MTPA does not support the current proposed layout.

Key areas of concern include potential impacts on critical habitats such as intact grassland patches, Critical Biodiversity Areas, Important Bird Areas (IBA), climate change corridors, and National Protected Area Expansion Strategy (NPAES) zones; risks to avifauna, including numerous species of conservation concern; perceived shortcomings in specialist assessments and statistical methods; insufficiently tested mitigation measures, especially with respect to buffer zones; and the cumulative impacts within a region already facing significant development pressure.

2. CORE CONCERNS

2.1 Impacts on Sensitive Habitats

Intact Grassland Patches

Intact grassland patches allow species to thrive and to support species that may need to move in response to climate change, enabling the normal functioning of natural ecological processes such as fire regimes or pollination. These patches are typically larger than 100 ha, with little or no gaps and minimal edge effects, and occur in close proximity to other intact grassland patches. They function as "source areas" in metapopulation dynamics where birth rates exceed death rates. No significant impacts should be allowed that would change a source area into a sink area (where death rates exceed birth rates). Mpumalanga has only 1,039 intact grassland patches, covering 15% of the province. These areas have been prioritised for their connectivity importance and must be avoided by wind energy facilities.

The intact patches on Sheepmoor are critical for maintaining connectivity with other grasslands. Despite MTPA raising concerns, specialist reports were largely silent on their importance. Using over 80,000 bird observations, the MTPA confirmed that intact grasslands have a 22% higher likelihood of hosting birds of conservation concern, 49% more birds of conservation concern, and 98% more individual bird observations than non-intact grasslands. These patches make up 23% of the Sheepmoor WEF footprint, and eight turbines (26, 27, 28, 29, 31, 32, 33, and 43) are located within them. These turbines should be removed. See Figure 1.

Therefore, the MTPA feels stronger than ever that the establishment of wind farms in intact grassland patches should not be allowed as it may turn a "source" area into a "sink" area. Even Page 3 and 4 of the Faunal assessment within the DEIA recognises that "*Faunal integrity relies on inter-connected grassland habitats across landscapes*." and "*…any contiguous areas of intact grassland are considered as high conservation importance*."

Figure 1: 3D map showing the location of the current turbines. Intact grassland patches are shown in green. Nest sites of threatened birds in red. In the current layout, there are still many turbines in the intact grassland patches.

Other Sensitive Spatial Areas:

Climate Change Corridors

The MBSP's climate change corridor network was designed to enable species and ecosystems to adapt to a changing environment. The corridor network considered a single-best (least-cost) corridor connecting up the climate change refugia with the climate change corridors from adjacent provinces. Additional fine-scale corridors were then identified using Circuitscape, finding alternative pathways and identifying pinch points in the corridors and thereby building resilience into the corridor network.

As can be seen from Figure 2, climate change corridor runs predominantly north-south through the project area, linking the climate change focal areas (as well as coincidentally the Grassland IBA with the Chrissies Pans IBA). Given that large birds do not fly in narrow, predictable lines, a flight corridor would need to be functionally broader than the MTPA provided fine-scale corridor. A broader macro-scaled corridor would be required for avifauna to ensure safe passage along the corridors. Maintaining this linkage is essential for long-term ecological resilience under climate change. The following turbines are within 500m of the climate change corridors and should be removed: 29, 31, 32, 33, 34, 36, 40, 42, 43, 44, 45, 46, 51, 52, and 53, as they would compromise this corridor.

The risk from the proposed wind farm on the corridor network is that the wind farm is unfortunately located along an important north-south macro regional flyway/corridor (also supported by vulture tracking data, Figure 9) which will result in increased collisions and electrocution, and habitat displacement. It stands to disrupt movement along the corridor and result in increased mortalities.

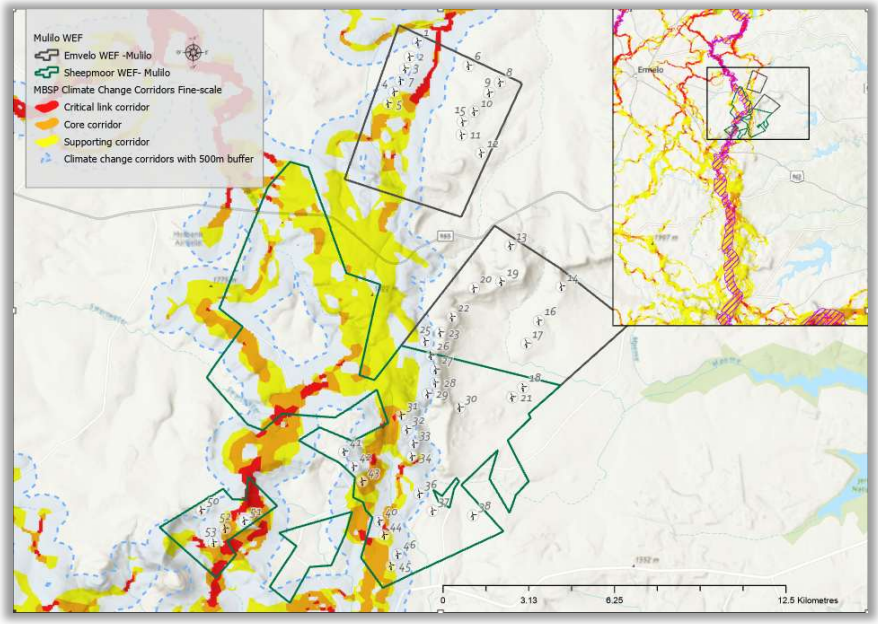

Figure 2: MBSP Climate Change Corridor network that links up climate change priorities with refugia and national climate change corridors. A 500m buffer has been added to the fine-scale corridors due to the need to accommodate mobile avifauna along a macro-scale corridor.

National Protected Area Expansion Strategy (NPAES 2018)

Over 60% of the proposed WEF falls within NPAES spatial priority areas, with 25% of turbines directly on focal areas. These sites are nationally significant for conservation expansion. Currently, 11 turbines (26, 27, 28, 29, 31, 33, 43, 44, 45, 52 and 53) are located in NPAES zones and should be removed.

2.2 Avifaunal Risks and Buffer Zones

The site's recognised avian biodiversity, including numerous sensitive and threatened species, necessitates a highly precautionary approach to impact assessment and mitigation. Many of the proposed mitigation measures are novel, untested, and costly. We don't believe the developer has adequately considered the costs of implementing all the recommended mitigation (and curtailment) measures on the success of this project, nor the chances of their efficient implementation (as they rely on models, people, expertise, budgets, and commitment).

Important Bird Areas (IBAs) and IUCN Key Biodiversity Araes (KBAs)

The proposed WEF falls in an area rich in bird species, particularly birds of conservation concern. Thirty-two priority bird species for wind energy development have been recorded within the WEF and broader area. An additional seventy-six species have been recorded which are powerline sensitive. Of particular concern are the occurrence of African Marsh-Harrier (EN), Black Harrier (EN), Blue Crane (VU), Blue Korhaan (NT), Cape Vulture (EN), Denham's Bustard (VU), Grey Crowned Crane (EN), Lanner Falcon (VU), Martial Eagle (EN), Secretarybird (EN), Southern Bald Ibis (VU), White-bellied Bustard (VU), and Yellow-breasted Pipit (VU). These are all threatened bird species at risk of extinction, over various timeframes. This rich avifaunal biodiversity is recognised regionally and globally through its inclusion within IBAs and KBAs. IBAs make up 55% and KBAs 12% of the Sheepmoor WEF.

At the heart of the MTPA's concerns, resulting in our objection, is the rich avifaunal diversity that is at risk of continual loss of mature individuals through collisions and electrocutions.

The avifaunal specialist report acknowledges that collision can be reduced from a high to a medium impact following post-mitigation. However, **with 14 threatened bird species occurring on site**, reducing the impact to a medium level is still significant (if at all possible), as any loss of large individuals may impact the conservation status of these species, particularly in light of cumulative impacts from the 359 planned or approved, and 127 approved wind turbines within 35 km of Sheepmoor WEF. Additionally, the avifaunal specialist report assessed the cumulative impact of Sheepmoor WEF to be moderate to high.

BirdLife monitoring report of 2025 states that on average, for every turbine, there are 4.25 bird fatalities per year, and that 10% of these were species of conservation concern. With every turbine added, the risk of collisions increases.

Avifaunal assessment for draft Strategic Environmental Assessment for Phase 3 For Wind and Solar Photovoltaic Energy

The MTPA received the REDZ datasets from the CSIR in May for comment. These datasets may still be refined, but they represent the best available avifaunal data that will eventually inform the DFFE screening tool. Although still a draft product, the dataset is based off actual data and the MTPA believe it to be a significant improvement in the data currently available to evaluate renewable energy applications. Querying this dataset the following important avifaunal datasets cover Sheepmoor (Table 1). The spatial extent these features is mapped in Figure 3.

Table 1: List of REDZ species and their risk and conservation status occurring over Emvelo and Sheepmoor WEFs.

Species	Risk	RDL Status
African Grass Owl	High	Vulnerable
Cape Vulture	Medium	Endangered (Regionally)
Grey Crowned Crane	High	Endangered
Rudds Lark	High	Endangered
Secretarybird	Very High	Endangered (globally)
Southern Bald Ibis	Very High	Vulnerable
White-winged Flufftail	Very High	Critically Endangered
Wattled Crane	High	Critically Endangered
Yellow breasted Pipit	Very High	Vulnerable

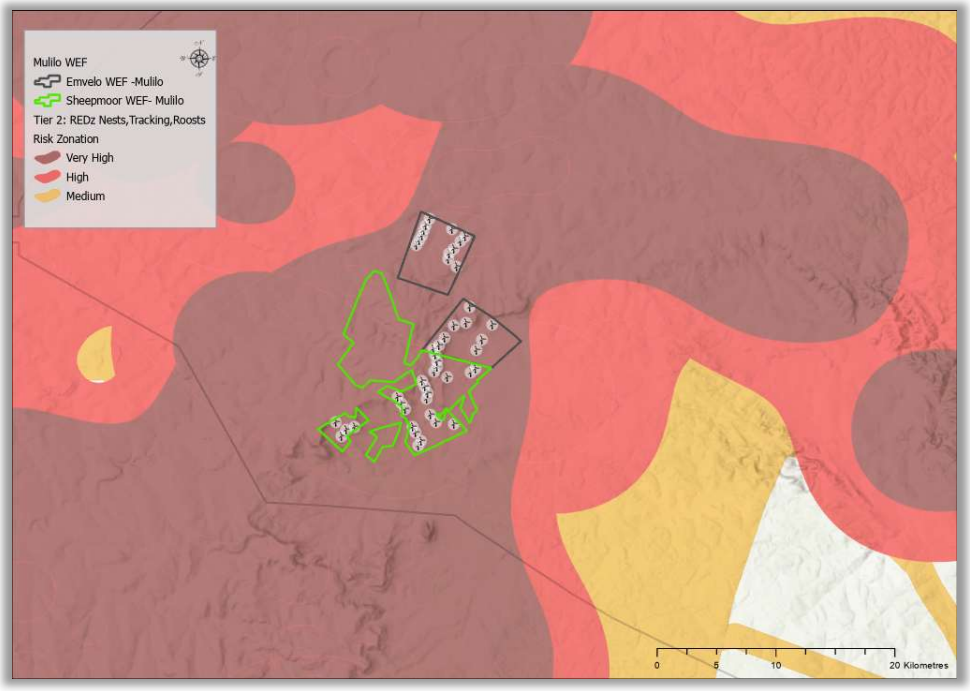

Figure 3: Spatial extent of the Tier 2 draft SEA REDZ 3 avian risk sensitivity layer covering Emovelo and Sheepmoor.

Buffers: Southern Bald Ibis

The specialist proposes shaped buffers based on modelled flight patterns, allowing turbines effectively within 506m (potentially as close as 100m) of roosts/nests. This represents a significant reduction from standard recommendations (1-2.5km) and appears inadequately precautionary, especially as it doesn't explicitly incorporate rotor overhang. Concern is raised about the accuracy and reliance of flight paths derived from observational vantage points. Confidence in these buffers is further reduced by the extremely limited flight path data used in their modelling. In the absence of a validated or peer-reviewed model, the MTPA recommends a minimum 1km buffer around these breeding colonies, which would require removal of turbines 28, 29, and 41. See Figure 4 for the 1km buffer zone and affected turbine locations.

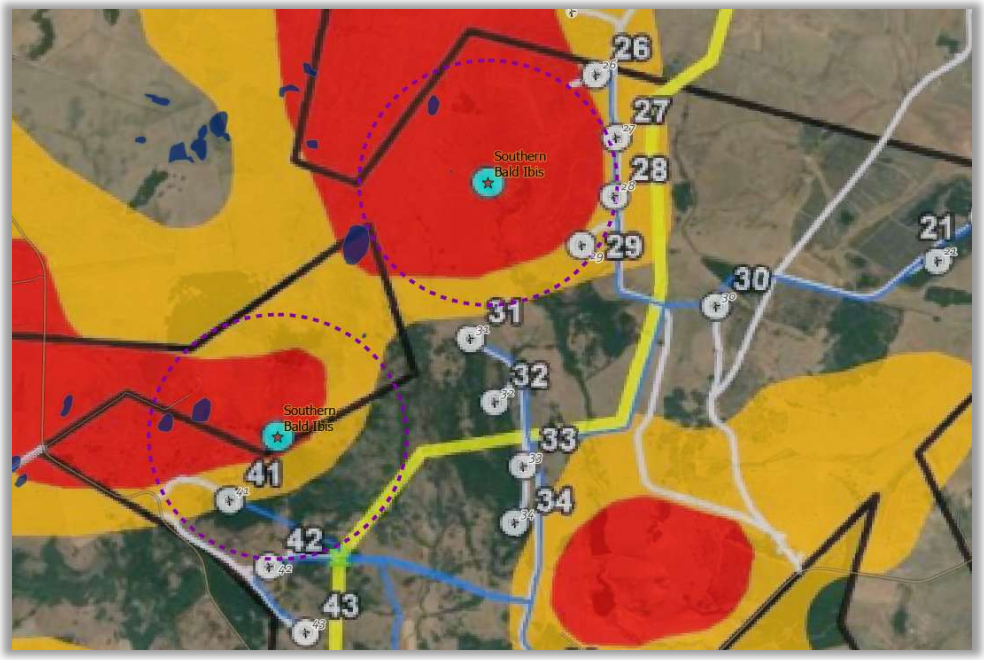

Figure 4: Map from avifaunal specialist report (July 2025) showing the Sheepmoor Southern Bald Ibis sensitivities and their proposed shaped buffer, a deviation from the standard 1km buffer. The purple dotted line represents a 1km buffer that then touches on several turbines.

African Grass Owl

African Grass Owl (*Tyto capensis*), a regionally Vulnerable species, has been recorded on Emvelo WEF in the east. These endemic and range-restricted owls have a very small home range of 423 ha (Pretorius 2019). To avoid any impacts to these sites, Pretorius *pers. comm.* recommends this home range be converted to a radius of a circle of 423 ha in size. This equates to a 1160 m buffer. By applying these to the known observations on Emvelo, it affects the placement of turbines 17 (Emvelo) and 18 (Sheepmoor). These localities are buffered and mapped in Figure 5.

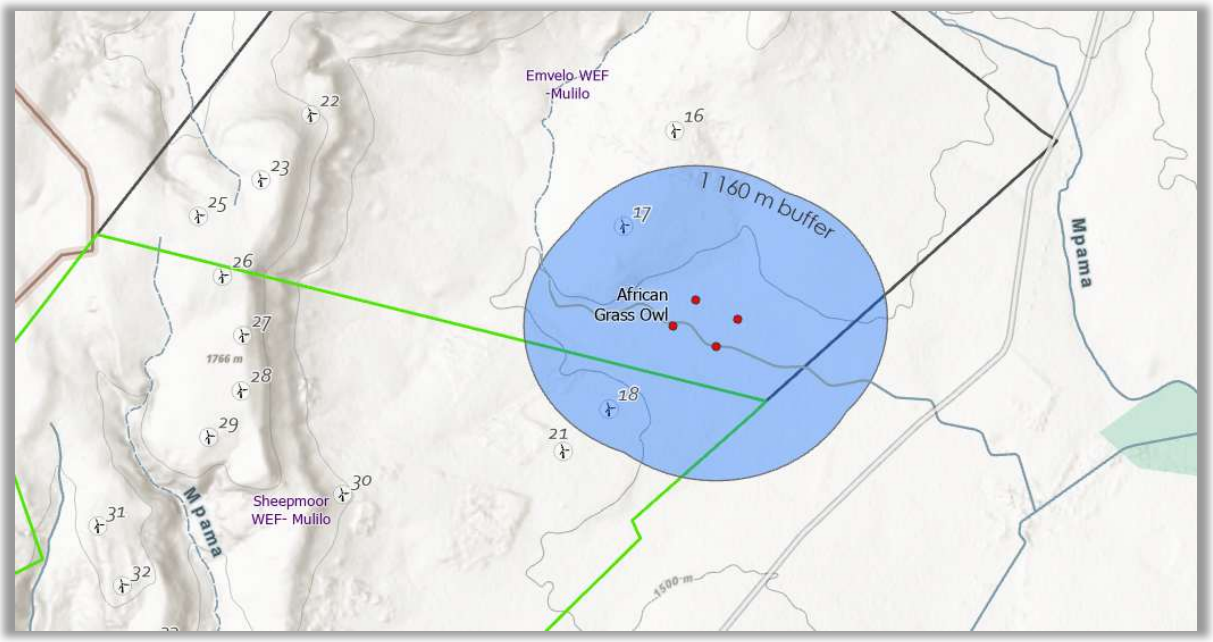

Figure 5: African Grass Own (Vulnerable) localities with the recommended 1160 m buffer to cover their strict home range of 423 ha.

Buffers: Martial Eagle

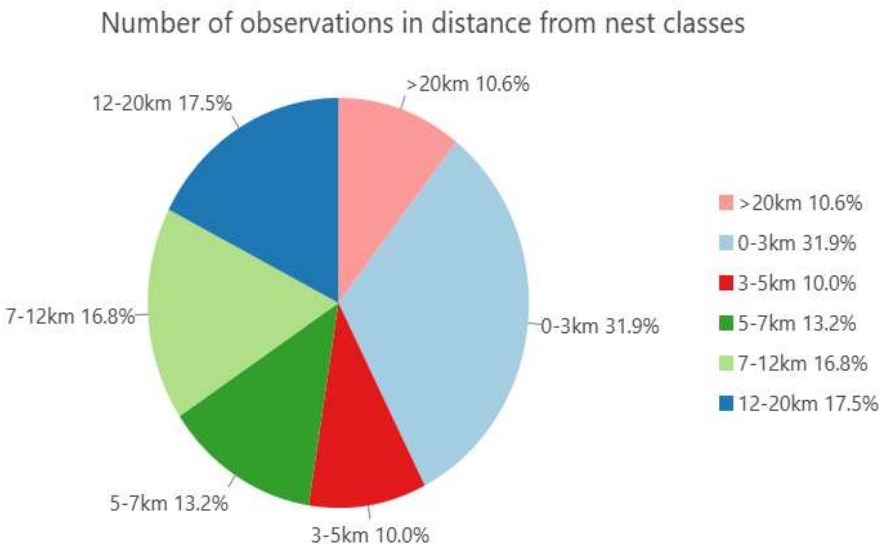
The MTPA has significant concerns regarding the use and modelling of Martial Eagle collar data. The MTPA obtained a copy of the flight data containing 13,111 observation points, compared to the 13,680 observations used by AfriAvian. We used GIS to confirm key findings in the avifaunal assessment, focusing only on data from juvenile and adult tracking collars around the Emvelo and Sheepmoor sites, excluding the Free State male.

EWT previously advised using a 5-6 km buffer around nest sites. More recently, BirdLife (2025) recommended a 6 km buffer around nesting sites. This recommendation aligns with preliminary outputs from the National Martial Eagle Risk Assessment (MERA) tool led by the University of Cape Town, which supports applying a circular buffer of approximately 5 km to include core ranges heavily utilised by resident breeding Martial Eagles, rather than applying bespoke buffers based on tracking and observational flight path data. Given 40 individual collared Martial Eagle tracking datasets, researchers could not build a reliable model to guide wind farm development, as Martial Eagles appear particularly difficult to model for flight patterns.

Against this backdrop, it is concerning that AfriAvian claimed they could accurately model flight risk for Martial Eagles and were confident enough to reduce the nationally recommended buffer by more than 50% (to 2.5 km for the High Risk zone). Such confidence in model output would be required to make this bold decision, as any failure may result in the loss of both parents and the entire breeding pair.

AfriAvian's Approach: AfriAvian combined all GPS tracking data with fine-resolution field monitoring data (37+ hours of observations) to develop a Flight Risk Model. The output was processed to identify High and Medium risk zones. The High risk zone encompassed approximately 79 km², comparable to the area covered by a 5 km circular buffer (78.5 km²) recommended by BirdLife and EWT. However, AfriAvian then extracted from the High risk zone a "Very High risk zone" as their no-go area, relying on Martial Eagle tracking and in-field observational data showing approximately 75% of recorded flight activity within 3 km of the nest. This was not only a subjective decision lacking scientific rigour, but as demonstrated below, the approach is fatally flawed.

Statistical Flaws in the Model: The flight risk model created using machine learning combined coarse-scaled GPS data across a wide area with fine-scaled, dense flight path data from a very limited area (majority within 2 km of nest) (see Figure 18 in the avifaunal assessment). Incorporating detailed, fine-scaled observational flight paths from such a limited area introduces spatial bias, where model output is disproportionately influenced by the more detailed sampling from the fine-resolution area, leading to overrepresentation of that smaller region.



This approach is statistically flawed when differences in spatial area, resolution, sampling intensity, and density are not properly accounted for. This violates spatial statistical assumptions, resulting in inconsistent variance estimates, inaccurate predictions, and biased interpretations that do not accurately reflect broader spatial patterns.

MTPA Analysis and Findings: The MTPA used the same GPS tracking data to verify whether Martial Eagles spent 75% of their recorded flight activity within 3 km of the nest but could not replicate this statistic. We calculated the distance between each GPS observation (n=7266) and the nest, we then categorised each observation into the same distance classes that AfrAvian used in Figure 22 of their report. We used only flight data from the adult female and juvenile in this area, discarding Free State data (nest location unknown).

Importantly, we separated data into two types: (1) the complete dataset covering flying and stationary periods, and (2) a subset including only flying periods (>0.2 km/h). The second dataset was considerably smaller. Although collar tracking was programmed not to record locations between 19:00 and 4:00, 20% of observations were still recorded at before sunrise or after sunset. For flight risk modelling, only observations when birds are flying and at collision risk should be included, not when roosting, nesting, or perched.

We calculated the distance within which 75% of all observations occurred for the full dataset (including evening and nesting periods), finding a distance threshold of 5.6 km. For the flying-only dataset, this distance increased to 13.5 km (see Figures 6 and 7).

For AfriAvian to get to a value of 75% for all observations within 3km of the nest, they must have (1) used all the flight data, including the datasets that were only recorded at the nest (introducing spatial bias and a statistical flaw), (2) they must have used all the observational data, including when the bird was stationary and sitting on a nest, and (3) a different statistical approach to analysing the data. Regardless, our analysis provides a markedly different outcome, aligned with the 5-6 km buffer recommended by EWT and BirdLife, and invalidates the 2.5 km buffer proposed by Mulilo for the High Risk zone. This High Risk zone should be removed as there is no statistical confidence in its delineation, potentially putting birds at collision risk.

Distance from nest class	Flying only localities	Flying / Stationary localities
0-3km	31.9%	58.6%
3-5km	41.9%	60.8%
5-7km	55.1%	77.9%
7-12km	71.9%	85.3%
12-20km	89.4%	95.3%
>20km	100.0%	100.0%

Figure 6: Pie chart showing the number of Martial Eagle observations/points within distance classes from Martial Eagle nest. The table on the right presents the cumulative value of the distance classes, for the entire combined dataset, or with only the localities where the Martial Eagle were flying (>0.2 km/h). Results show that for the entire dataset of 7 266 points, 75% of the observations were within 5.6 km of the nest, while for the flying Martial Eagles, 75% of the records were within 13.5 km of the nest.

Breeding Cycle Considerations: Martial Eagles display significant differences between breeding and non-breeding periods. They typically breed every second year; therefore, a minimum of two years of data is essential when considering range use to capture both intensive breeding seasons and "sabbatical" periods when Martial Eagles often utilise larger ranges away from nesting sites. The GPS records for both birds covered 1 year and 1 month (10 April 2024 to 9 May 2025), meaning AfriAvian's analysed data did not cover a full two-year cycle.

Adult female Martial Eagles utilise home ranges differently than males, who spend considerable time hunting and provisioning for incubating partners and developing nestlings. During core breeding periods, females exhibit much higher nest site fidelity while males forage extensively over larger ranges. Females typically do not fly as far as males during core breeding seasons; therefore, the exclusion and lack of buffers considering male Martial Eagle range use is concerning. The conclusions did not factor in male flight activity, range use, and flight paths over the Mulilo project area.

Mitigation Concerns: Proposed mitigation measures include curtailment for Martial Eagle flights. However, the avifaunal report found that Martial Eagles are most active at moderate wind speeds of 5.5-10 m/s. Curtailment would significantly impact turbine power generation capacity, and we believe these costs were not considered in assessing the viability of proposed mitigation measures.

With the 5.5 km circular buffer being the current recommended buffer around Martial Eagle nests, the application of a 5.5 km buffer will result in the removal of 2 turbines, namely: 26 and 27. See Figure 8 below.

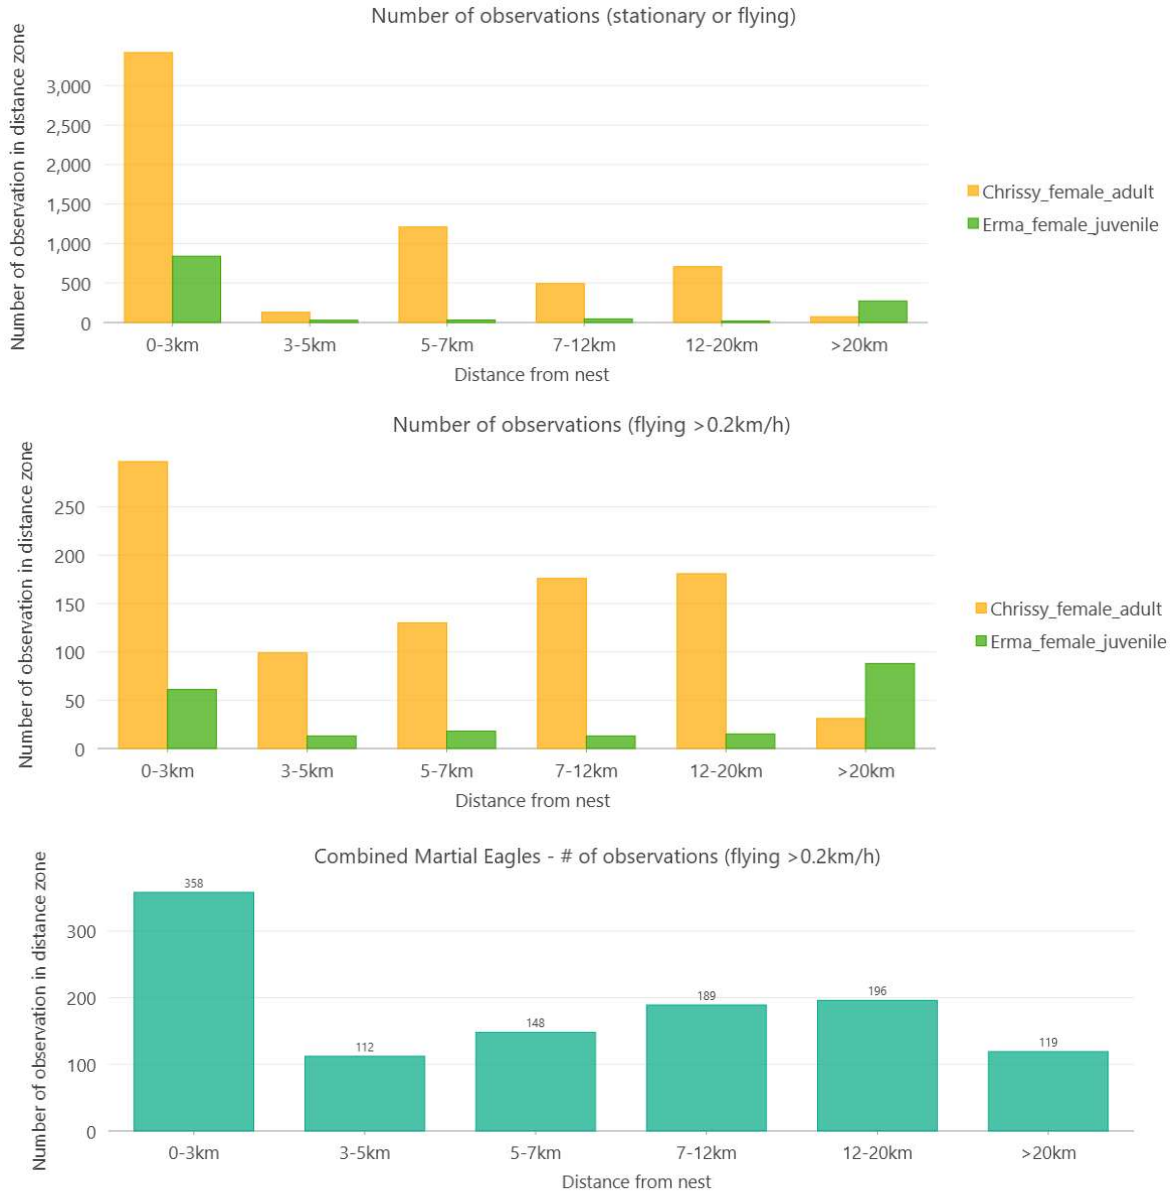


Figure 7: Bar-chart showing the number of observations from the collar tracking data in distance classes as used in Figure 22 of avifaunal report. Top-most chart presents all the observations (n=7266) for the adult and juvenile Martial Eagles. The middle chart presents only the observations where the Martial Eagles were flying (n=1122) in distance classes from nest. Bottom chart presents the combined datasets for both juvenile and adult birds in distance classes from nest. Bar chart bars are labelled with actual number of records in each class.

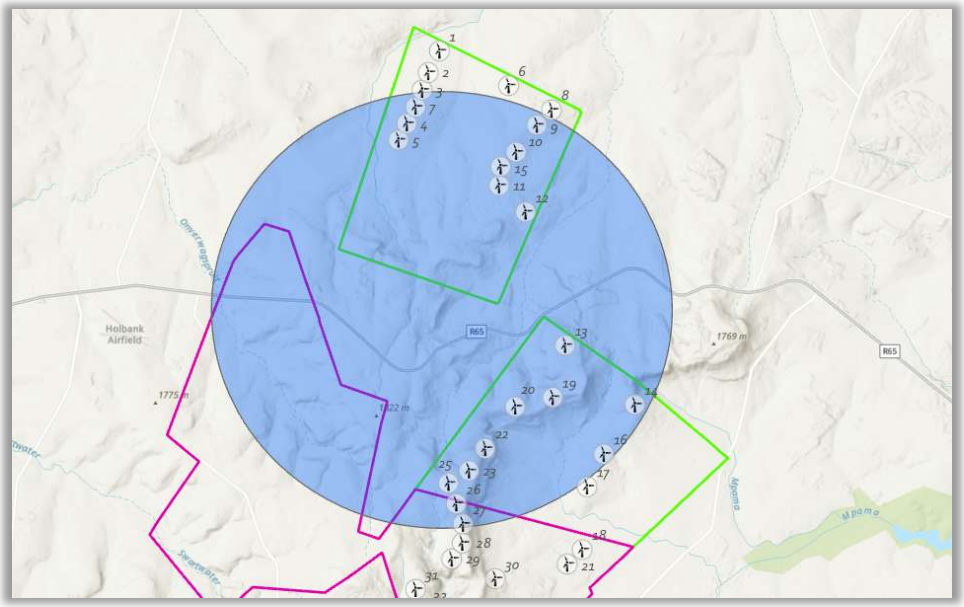

Figure 8: Application of a 5.5 km buffer around the Martial Eagle nest site and the impacted wind turbines.

Avifaunal Assessment: 2 -year of data gathering required and overreliance of models

Given the site's avifaunal sensitivity, two years of comprehensive avifaunal monitoring would be required. While we understand an additional year was added to monitor the Martial Eagle, this did not include visiting all vantage points as required by BirdLife guidelines. Figure 19 in the Avifaunal assessment shows the limited extent of this additional monitoring, which was confined to the Martial Eagle nest site. Such sensitive and vulnerable avifauna requires more comprehensive monitoring to properly understand and assess potential impacts.

Modelling is used throughout the project sites, from the identification of suitable habitat to avoid, through to predicting where Southern Bald Ibis is likely to fly once leaving a roost, to mitigating impacts. AfriAvian's flamingo model for Leghoya WEF was found to miss 50% of the important pans supporting flamingos (based on actual sightings). We highlight above the spatial bias that was introduced into the Martial Eagle Flight Risk Model, and the inability to replicate and confirm that 75% of the recorded flight activity is within 75% of the nest. George P. Box famously once said "*All models are wrong, but some are useful*".

There is an increasing tendency to over rely on models, perhaps because they sound to sophisticated, to mitigate and minimise all possible impacts to acceptable levels. This is wrong. Unless models can be validated with data that was withheld, or gathered afterwards, we need to approach models with caution. Models may be acceptable when they refine boundaries of established circular buffers, but they become problematic when they result in 50% reductions in buffer boundaries without validation or peer review. Our detailed analysis of the Martial Eagle model revealed several critical flaws, as discussed above.

As a result of these repeated issues with model accuracy and validation, the MTPA has become increasingly distrustful of models as primary decision-making tools for sensitive environmental assessments. Robust field monitoring and established precautionary guidelines must take precedence over unvalidated modelling outputs.

Cape Vulture flyways

Cape Vultures are globally vulnerable and regionally endangered. The specialist assessment did observe Cape Vultures over the project area for 48 minutes over 756 hours, and within the rotor swept zone. This amounts to 1 vulture visit every 2 weeks. According to the vantage point priority bird monitoring statistics, Cape Vultures were the 7th most observed priority species (out of 23) over the 1 year of observation.

In the recent Birdlife summary report from monitoring operational wind energy facilities (2025), it provides a case study of a wind farm that recorded a very low numbers of Cape Vultures during pre-construction monitoring (recorded in less than 1% of total vantage point surveys), yet later in the year, once operational, the wind farm had shutdowns involving 384 Cape Vultures. This highlights the need for impact assessments to incorporate all sources of information, and to be careful of initial low observations during pre-construction monitoring.

The MTPA queried the Cape Vulture flight paths on Movebank.org early in April 2025 – See Figure 9 (Kruger NP Raptors E-obs (n=18); Vulpro (Rehab & Captive bred) (n=123); & EWT SigFox Vultures (n=18)) to create the below map showing Cape Vulture flight paths based on density of observations in Movebank.org. This data in Figure 9 clearly shows a north-south flightpath that connects the northern Mpumalanga Escarpment with KwaZulu Natal in the south. And with the specialist reported observation that the vultures fly within the rotor swept zone, we are very concerned about the risk that the wind farm may pose to vultures as they fly through this corridor. This corridor impacts all the proposed wind turbines.

Vantage Point Monitoring

Based on the latest and current turbine layout, 3 of the 25 turbines are not covered by the 2km vantage point buffers, amounting to 12% of turbines not been covered.

2.3 Specialist Assessments

While extensive specialist work has been undertaken, MTPA notes areas where further information or methodological alignment could strengthen the overall environmental assessment.

General

Enhanced integration between the aquatic, faunal, bat, terrestrial and avifaunal assessments is recommended to better understand potential synergistic or cumulative biological impacts.

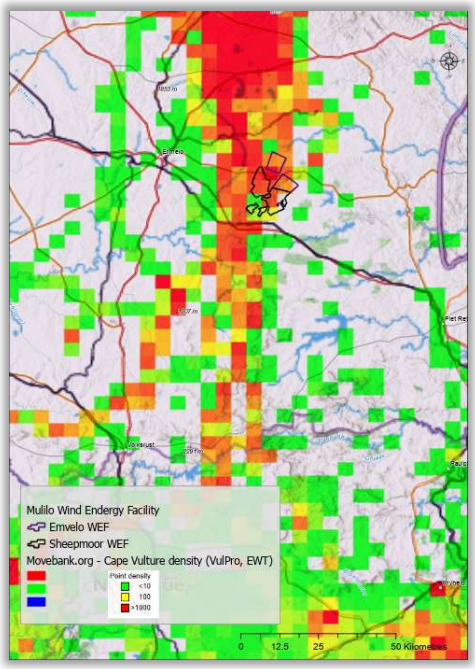

Figure 9: Tracking data from Cape Vultures flying over the Emvelo and Mulilo WEFs. Data sourced from Movebank.org in April 2025. Data source VulPro, EWT. Symbology represents density of recorded points. Red = high density.

Faunal Specialist Assessment

Placement of infrastructure in high/very high sensitivity areas warrants careful justification given specialist recommendations to avoid these areas. While we acknowledge the inclusion of a detailed oribi management plan, no detailed oribi survey of this area has occurred, nor is a map of oribi habitat or oribi observations included. Its inclusion at this late stage is only in response to issues raised in the Draft EIA report. Although it is possible that an oribi management plan could improve the local status of the oribi within the footprint area, it can also be said that the failure to adequate survey for oribi since this was raised in the scoping report stage (meeting), means that the proposed development may have a significant negative impact on the oribi. How do we know that turbines, roads, or infrastructure will not be placed in core habitat for oribi? The MTPA has reached out to EWT and they do not know what impact wind turbines will have on this highly sensitive mammal. The developer should not be surveying for oribi after the development is approved, it should have happened during the EIA phase.

Terrestrial Biodiversity Assessment:

The MTPA has significant reservations regarding the Terrestrial Assessment. Key concerns include:

- The terrestrial biodiversity theme is still not aligned with SANBI's Species Environmental Assessment Guideline (2022) that the consultant is required to comply with in terms of Notice 1150 of Government Gazette 43855 of 2020.

- The author only allowed for 4 days to survey both the Sheepmoor and Emvelo WEF sites during the summer months, when most summer rainfall plants would be flowering and identifiable. Four days is certainly not enough to cover an area this size (12,543 ha for both WEFs). This report is the same report as submitted with previous DEIA.
- No plant species of conservation concern, or endemics, were recorded on site. This is not surprising given the lack of time to survey this large area. ERM also opted to appoint a botanist not familiar with the flora of this area. There are several endemics restricted to this area that would be unfamiliar to someone not from the area. It just makes it harder to confirm identification, particularly with limited time and coverage in the field. **The MTPA is confident that several species of conservation concern would occur on site; they were just not detected**.
- The failure to apply the SANBI Guidelines resulted in inadequate time being allowed to properly assess the terrestrial biodiversity (botany) and the determining of site ecological importance (SEI). The consultant did not follow the SEI methodology, as required in terms of the SANBI guidelines and the MTPA does not believe that the approach followed to identify sensitive areas would be able to adequately assess the environmental sensitivity for this area. There were a number of additional variables that could have been applied (site-specific species, CBAs and ESAs, climate change corridors, intact grasslands, rocky ridges, etc.), patch size, together with criteria and approach of that are required in the SANBI Species Environmental Assessment Guidelines.
- The approach followed resulted in some CBA Irreplaceable areas, that overlapped with intact grasslands and provincial climate change corridors, being designated **medium** sensitivity (as a maximum value because it did not ultimately fall within the Eastern Highveld Grassland). This is fundamentally wrong as there was no consideration for any species of conservation concern (like roosting areas) or other spatial priorities like CBAs to meet biodiversity targets. Applying the SANBI criteria could allow the montane grassland to be categorised as *high*, or even *very high* if species and additional data were considered.
- In terms of the terrestrial biodiversity assessment, the result is that the montane grassland (not degraded) is of *medium* sensitivity, but the degraded Highveld grassland has *high* sensitivity, and non-degraded a *very-high* sensitivity. This does not make sense. We have significantly more threatened plant species recorded in the Wakkerstroom Montane Grassland than for the Eastern Highveld Grassland and consider far more sensitive.
- Ultimately, the MTPA does not agree with the vegetation sensitivity analysis that then fed into other planning processes, such as the offsets, as it did not apply SANBI's Species Environmental Assessment Guideline (2022).

2.4 Biodiversity Offset Report (BOR)

Firstly, the MTPA never requested a biodiversity offset report. When meeting with Mulilo many months ago, Mulilo mentioned they would offset their impacts, and even committed to developing an Oribi Biodiversity Management Plan. In reviewing the first DEIA, the MTPA merely commented that there were no BOR or Oribi management plans.

The MTPA appreciates the effort that has gone into compiling the draft Biodiversity Offset report, however the offset assessment and report only partly covers the residual biodiversity loss to sensitive areas, such as CBAs and Intact Grassland Areas, and not to the avifauna of conservation concern. The offset report should in fact explicitly assess whether any residual impacts affect irreplaceable biodiversity that cannot be offset, which will be a fatal flaw. In

addition, the MTPA feel that the anticipated negative impacts to long-lived threatened bird species cannot be adequately quantified nor offset.

The proposed BOR sets specific hectare targets for offsetting the direct loss of natural terrestrial habitats, particularly for areas supporting Species of Conservation Concern (SCC). These targets are based on biodiversity offset ratios, with a total of 507.15 hectares designated for offset, broken down by vegetation type and Mpumalanga Biodiversity Sector Plan (MBSP) category. The core of the terrestrial offset involves restoration efforts on disturbed and transformed areas within the study area. These areas include cultivated lands, disturbed Montane Grassland, disturbed Highveld Grassland, and alien invasive plantations. The aim of the BOR is to create additional habitat for Species of Conservation Concern (SCC), such as the Oribi, by restoring degraded grasslands.

The proposed offset strategy is partly aligned with the national offset strategy, however the formal legal security of the offset sites is incomplete. The BOR is certainly not clear how the site security will be guaranteed over the long term. Mulilo have lease agreements, and mention that servitudes or protected areas declaration may be pursued, but that does not meet the requirement of the offset guideline to do so and secure them. Mulilo proposes several internal onsite areas as offsets. These may not meet the requirements for a protected environment in a wind farm where avifaunal collisions occur. The MTPA will only consider offsets away from areas with turbines as possible protected environments. Hence there is no guarantee that the selected offset areas can ever be secured. Offsite offsets should have been identified and assessed in the report.

Furthermore, the candidate portfolio of offset sites is not provided in any detail. This shortfall is important as it is required for the competent authorities to assess any risks that cannot be offset. In addition, Mulilo commits to monitoring and adaptive management but alignment with the national offset guidelines do require specific biodiversity outcomes, monitoring indicators, success thresholds, and reporting plans.

The long-term financing mechanism and governance of the offsets are not discussed in any detail. It is important to secure long-term management funding (via a trust, endowment, etc.) and the governance arrangements, such as who will manage the sites, who will audit performance, etc.

The BOR also relies on rehabilitating disturbed areas; however, offsets should ideally be in relatively good condition (except for wetlands, which can be disturbed). Once grassland has been ploughed or planted up with trees, the biodiversity does not recover in our lifetime and restoration of these areas do not meet the biodiversity offset requirements.

The BOR includes offsite actions for priority bird species and avifauna buffer concepts, however, these must be converted into measurable outcomes (e.g., collision mortality reduction targets, powerline design/marking standards, and monitoring). Alignment with the national offset strategy requires species-sensitive responses be explicitly built into offset design when species with specific habitat needs are affected.

.

2.5 Cumulative Impacts

The concentration of renewable energy projects in Mpumalanga (890 turbines approved, in process, or planned), particularly along this sensitive escarpment, necessitates careful consideration of cumulative impacts. Each additional project contributes incrementally to regional habitat fragmentation and potential impacts on species

populations, especially avifauna. The avifaunal assessment states that the proposed Mulilo WEF, alongside three other renewable energy projects within a 35 km radius, would contribute to a total of 131 (incl. Sheepmoor). Sheepmoor's turbines represent approximately 21% of the total planned turbines, indicating a moderate to high cumulative impact. For Sheepmoor, the cumulative impacts on birds are rated as High pre-mitigation and Medium post-mitigation. Bearing in mind the very optimistic mitigation proposals, dependant on a multitude of models and processes, places the implementation at risk.

The MTPA was able to query its database on renewable energy projects and actual turbine locations to provide the following important statistics (based on approved, under-consideration, and planned wind farms). Please note that these stats include the current proposed Sheepmoor project's turbines within the numbers presented.

- *10 km radius*: 70 turbines (3 approved)
- *20 km radius*: 216 turbines (65 approved)
- *35 km radius*: 359 turbines (127 approved)

The actual number of turbines approved or in process of being approved is double that what the avifaunal specialist used in their calculations. Yes, their addition makes up a smaller percentage but it adds to the threshold beyond which avifauna populations(and bats) may start crashing. With every turbine added, the risk of collisions increases. As these turbines have not been built, the renewable energy industry, and government, do not fully comprehend the massive impact that the wind farms will have on the avifauna and bats and the need to preserve sensitive areas to ensure their long terms persistence.

2.6 Acknowledgement of recent change in landcover and impact on results

The delineation of the CBAs and intact grassland patches was based off a landcover map from 2010 and 2019 (but just for CBAs). Any subsequent loss or transformation is not a fault in the MBSP or intact grassland patches, but as a result of a legal or illegal change in land use. In the MBSP Handbook, the guidelines recommend that a site assessment is required to confirm the current land use. Any loss may require additional areas to meet targets (to be addressed in MBSP v2), while acknowledging that **the CBA status may no longer apply to these areas if they have been ploughed or developed** (where recovery is not possible within our lifetimes). Therefore, in terms of the Sheepmoor WEF, any change in land use from natural to cultivation or plantation would result in this particular area no longer being identified as a CBA or intact grassland patch.

.

3. Summary of Turbine Locations Requiring Reconsideration

Should DFFE proceed towards authorisation, we strongly recommend the exclusion of the turbines identified in below.

- WT 18: KBA, African Grass Owl buffer
- WT 21: KBA
- Wt 26: Intact Grassland Patch; NPAES, within 5.5km Martial Eagle buffer, IBA

- WT 27: Intact Grassland Patch, NPAES, within 5.5km Martial Eagle buffer, IBA
- WT 28: Intact Grassland Patch, NPAES, within Bald Ibis buffer, IBA
- WT 29: Intact Grassland Patch, Climate change corridor, NPAES, within Bald Ibis buffer, IBA
- WT 31: Intact Grassland Patch, Climate change corridor, NPAES
- WT 32: Intact Grassland Patch, Climate change corridor
- WT 33: Intact Grassland Patch, Climate change corridor, NPAES
- WT 34: Climate change corridor
- WT 36: Climate change corridor
- WT 40: Climate change corridor
- WT 41: Within Bald Ibis buffer
- WT 42: Climate change corridor
- WT 43: Intact Grassland Patch, Climate change corridor, NPAES,
- WT 44: Climate change corridor, NPAES
- WT 45: Climate change corridor, NPAES, CBA
- WT 46: Climate change corridor,
- WT 50: IBA
- WT 51: Climate change corridor, IBA,
- WT 52: Climate change corridor, NPAES, IBA
- WT 53: Climate change corridor, NPAES, IBA

4. Closing

In conclusion, **the MTPA maintains a strong objection to the proposed Sheepmoor WEF in its current form**. The site overlaps with highly sensitive and irreplaceable biodiversity features—including intact grassland patches, climate change corridors, Critical Biodiversity Areas, KBAs, IBAs, and NPAES priority expansion areas—supporting numerous threatened and endemic species. The avifaunal assemblage present, particularly threatened species such as the Martial Eagle, Black Harrier, Denham's Bustard, Cape Vulture, and African Grass Owl, places this site among the most sensitive in the province for wind energy development.

Our review identifies substantial flaws in the baseline data, methodological approaches, and statistical analyses used in the supporting specialist studies, particularly in the avifaunal assessment. Several models relied upon for impact prediction and mitigation zone delineation are unvalidated, contain spatial biases, or deviate from nationally recognised guidelines. Critical surveys, such as comprehensive Oribi assessments and adequate botanical surveys aligned with SANBI protocols, were not completed. As a result, sensitivity mapping, buffer zones, and mitigation recommendations cannot be considered robust or defensible.

The proposed mitigation measures—many novel, untested, and potentially unfeasible—are unlikely to adequately reduce the high to very high pre-mitigation risks to acceptable levels. Given the cumulative turbine density in the broader landscape, the unquantifiable long-term impacts on species with slow reproductive rates, and the loss of ecological connectivity, residual effects are expected to be severe and potentially irreversible.

In light of these factors, the MTPA concludes that the current turbine layout and offset strategy are fatally flawed from both a biodiversity conservation and environmental authorisation perspective. We recommend that authorisation be withheld and that any future proposal for this site be preceded by at least two full years of comprehensive, guideline-aligned monitoring; complete botanical and faunal surveys; and a layout that entirely avoids intact grasslands, key corridors, and critical habitats for species of conservation concern. Only a precautionary, science-based approach can ensure the long-term persistence of the biodiversity assets of this region.

Please do not hesitate to contact this office if there are any enquiries.

EXTERNAL MESSAGE

Hi Lucien I will take a look and get responses to you.

You had let us know about the responses so had kept a window this week.

I'll get them to you as soon as I can, I will just need to taka a look and may need to give some thought for a day or two or do some further analysis depending on what they are.

I note the timeline and will try get to you by end Wednesday or sooner if they are not too comlplex.

Regards
Jamie

Hi Jamie,

Over and above we have also received comment from MTPA which does require Terrestrial biodiversity input. Kindly see attached these comments for your attention.

I do apologize for the short notice we have on this project, but we do intend to submit the final by the end of the week on the 22 Aug. Please do let me know if you can accommodate us with these comment responses?

EXTERNAL MESSAGE

Hi Lucien, here are the reports with the revised layouts replaced where applicable (the last few maps in the reports).

There is an overlap with the Emvelo/Sheepmoor boundary that was provided where a central area fall within both sites. I have not had time to figure out what's going on there or to scrutinise the layout to check if there are any changes that affect the outcome of the assessment.

EXTERNAL MESSAGE

Dear Lucian,

Your request is received but kindly note the following:

Due Dates - Due to committed site visits taking place on 11 and 12 August 2025, unfortunately it is not possible to meet the due date of 12 August 2025. The revised issue date must consider both the updating and internal reviews which would be at least one (1) week.

Variation Order - Our team will review the final layouts and determine whether the changes will require and Addendum Letter or Full Revisions to be issued. The time and effort for updating the reports (full revisions) will require a variation order which will be confirmed and communicated to you for approval.

Trust you find the above in order.

Kind regards

Reabetswe MOKOMELE

EXTERNAL MESSAGE

Dear Lucien

Thank you for the opportunity to review the additional information. While we have not have the capacity to review the revised application in-depth, it is apparent that that many of our previously raised concerns and recommendations have not been addressed. Our previous comments dated 10 April 2025, and our objection to the proposed developments, therefore remain applicable.

We would also like to draw your attention the recently published guidelines for Special Species 23, available at the following link. We are concerned that the application is not aligned with these guidelines, which have been endorsed by the DFFE. Please consider those guidelines as additional comment on the applications.

Yours sincerely

Sam

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

To: ERM Arcus Amsterdam <ERM.ArcusAmsterdam@erm.com>
Subject: Comments on the draft EIA report for Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province - NWJ Vorster Trust

You don't often get email from vorsterboerdery@lantic.net. Learn why this is important
EXTERNAL MESSAGE

The NWJ Vorster Trust is thankfully not part of the proposed WEF anymore.
We will still be affected by the wind farm if it becomes a reality.
Therefore we want to raise our strongest concern against it.

1. All the turbines, on the edge of the escarpment, will permanently scar the scenery and is unacceptable.
2. We are very concerned about proposed turbines 40, 44, 45 and 46 because of the noise and most probably shadow flickering.
3. The same applies for turbines 51, 52 and 53.
4. Turbines 40, 41,42,43,44,45,46, 51 and 52 will cause visual pollution which is unacceptable.
5. Proposed turbines 40,043 and 44 are too close to the breeding site of the secretary bird. A safe no-go zone of at least 2,5km should be implemented around the nest. The two secretary birds stay in the area south east of this location and provision should be made to secure its foddering habit.
6. A Marial Eagle pair were spotted several times in the past at Farm Klipfontein. It is of great concern because the always fly off in a north east direction where most of the turbines will be located.
7. The southern bald ibis are also present in great numbers on the farm Klipfontein especially when cultivating land or harvesting. Provision should be made for a safe flying zone to their roosting site on neighbouring farm Windhoek where four turbines will be located.

Regards,

Pikkie Vorster – Director at Retsrov Boerdery

The NWJ Vorster Trust is thankfully not part of the proposed WEF anymore.

We will still be affected by the wind farm if it becomes a reality.

Therefore we want to raise our strongest concern against it.

1. All the turbines, on the edge of the escarpment, will permanently scar the scenery and is unacceptable.

Visual impacts have been assessed by a qualified visual specialist. While the introduction of turbines will alter the landscape, the placement and design have been guided by specialist input to reduce visual intrusion where possible. The concern regarding the scenic value of the escarpment has been recorded and will form part of the decision-making record.

2. We are very concerned about proposed turbines 40, 44, 45 and 46 because of the noise and most probably shadow flickering.

Noise and shadow flicker impacts have been assessed through specialist studies. Turbine placement and mitigation measures will be implemented to ensure compliance with acceptable thresholds. Should post-construction monitoring identify exceedances, further mitigation will be required.

3. The same applies for turbines 51, 52 and 53.

Answered above

4. Turbines 40, 41,42,43,44,45,46, 51 and 52 will cause visual pollution which is unacceptable.

As noted, visual impacts have been assessed by the visual specialist, with turbine locations refined to reduce exposure from key viewpoints. Your objection to the visual impact of these turbines has been recorded.

5. Proposed turbines 40,043 and 44 are too close to the breeding site of the secretary bird. A safe no-go zone of at least 2,5km should be implemented around the nest. The two secretary birds stay in the area south east of this location and provision should be made to secure its foddering habit.

The avifaunal specialist has surveyed known Secretary bird nesting and foraging areas in the study area. Turbine placement has considered these areas, and appropriate buffer zones are being implemented. Your request for a 2.5 km no-go zone will be shared with the avifaunal specialist for consideration in the final mitigation recommendations.

6. A Marial Eagle pair were spotted several times in the past at Farm Klipfontein. It is of great concern because the always fly off in a north east direction where most of the turbines will be located.

Martial eagle observations have been incorporated into the avifaunal assessment. Turbine layout refinements have been made to reduce potential collision risk, and mitigation measures, including operational curtailment where necessary, are being considered.

7. The southern bald ibis are also present in great numbers on the farm Klipfontein especially when cultivating land or harvesting. Provision should be made for a safe flying zone to their roosting site on neighbouring farm Windhoek where four turbines will be located.

Southern Bald Ibis roosting and foraging behaviour has been a key focus of the avifaunal specialist study. Turbine placement has been adjusted where possible to avoid high-use flight paths. Mitigation measures, such as operational shutdowns during high-risk periods, are under consideration.

Comments made by B Moodie

1. I am the owner of the farm Windhoek 291 Portion 3 & 5 and leaser of portion 4 & 10 which are adjacent to the proposed development of the Sheepmoor Windfarm'

Acknowledged. Your ownership and leasehold details have been noted and recorded for the project.

2. No communication or notification from Mulilo concerning the development the windfarm next to my property. Neighbours informed me of it and helped me to register as I&AP in March 2025. Mulilo acting on there own and ignore all protocols and spells danger for the future.

Notification of the project was undertaken in accordance with the requirements of the Environmental Impact Assessment (EIA) Regulations, including the placement of site notices, newspaper adverts, direct notification to identified landowners, and availability of project information for registration as an Interested and Affected Party (I&AP). We acknowledge that you became aware of the project through neighbours, and we will ensure that you continue to receive all project-related updates going forward.

3. May 2025 draft report suggested power lines will be constructed over my Windhoek property. There was no prior communication nor negotiations from any party concerning the permission for the power lines. Totally unacceptable.

The draft EIA report included an alternative grid connection layout and this is not the preferred route. Your opposition to any overhead lines crossing your land has been noted. The applicant is committed to engaging with yourself following a decision on the EA, in order to ensure that the layout aligns with your operations, as discussed with yourself during the in person meeting held on 04 August 2025.

4. No power lines will be allowed to run over my properties for various reasons.

4.1 Route as shown in report are crossing crop lands and will interfere with activities of farm machinery.

4.2 It will limit future expansions on the farm.

4.3 Increase movement of people for inspection line will increase criminal activities and risk of veld fires and therefore not acceptable.

4.4 Indications that power lines have negative influence on the reproduction of cattle. Unplanned and poorly communicated maintenance visits especially if involving helicopters and machinery can spook cattle, leading to stampedes,

Injuries, or even loss of livestock not to mention damage to infrastructure like fencing.

4.5 Aesthetic and Environmental Value will be lost.

4.6 Danger due to collusion of the bird population on the farm.

The potential impacts on farming operations, farm expansion, security, livestock health, aesthetic value, and avifauna have been recorded and assessed as part of the EIA report. We note your comments and will likely utilise other routes that do not pass over your property. We expect that the final layout of the powerline will not be approved in the EA process, and a layout update and future approval of the final route will still be needed.

5. There is secretary birds present on my farm which are foddering on the grassland where 4 turbines are planned on Windhoek Portion 8. These secretary birds will be in great danger to be killed by collusion with the turbines.

Avifaunal specialist studies have identified several sensitive bird species within the project area. Turbine placements have all been mitigated, and the avifaunal specialist is confident that the data and modelling undertaken to date to address avifaunal impacts is both accurate and credible. Secretarybirds are large conspicuous birds, that spend large periods of time on the ground. When they do fly, we are confident that the proposed mitigation of Shut Down on Demand will prevent significant mortalities of this species.

6. The same danger exists for the ibises which are in great numbers present on the farm. Some are roosting on the farm Waaihoek to the east and other on the farm Windhoek to the north - west. Both roosting routes will be polluted with turbines and the shredding of birds will be unavoidable, even with proposed mitigation gimmies.

Avifaunal assessments conducted for the project included focal studies specifically aimed at understanding the movement and habitat use of Southern Bald Ibis (SBI) within the landscape. These studies informed the delineation of formal no-go areas, which were established to avoid critical roosting and foraging zones.

The flight paths and spatial use patterns of SBI were modelled using extensive site-specific data, collected over multiple seasons. This modelling allowed for a more accurate representation of how the species interacts with the terrain and infrastructure.

As a result, turbine placements have been strategically adjusted to avoid overlap with identified SBI activity zones. In addition to spatial avoidance, mitigation

measures such as Shut Down on Demand (SDOD) will be implemented to further reduce collision risk during active flight periods.

7. I apposed the location of the 4 turbines close to the eastern border because.
7.1 Killing of the southern bald ibis which due that route to there roosting site.
7.2 Located in the secretary bird foddering area.
7.3 Combined effect will change the local microclimate of surrounding area. Report by specialist of influence on microclimate are requested.
7.4 It is visual not acceptable.
7.5 The noise pollution will increase during the dominate eastern winds.
7.6 The lights during the night as required by aviation are not acceptable.

Your concerns regarding turbine placement near the eastern border and on Portion 8 have been recorded, including potential impacts on avifauna, microclimate, noise, visual character, lighting, and shadow flicker. The microclimate aspect is outside the standard EIA scope, however, specialist studies have addressed noise, visual, and shadow flicker impacts, with recommendations and mitigations that the applicant will adhere to. The applicant will investigate all feasible solutions to reduce light pollution, in line with CAA minimum requirements, which may include an automated lights/radar system that only activates selected minimal turbine lights if aircraft are in the area.

8. Also opposed the turbines on the Farm Windhoek Portion 8
8.1 Killing the southern bald ibis on their route to their breeding nest in the winter.
8.2 Turbine 51 & 52 to close to my boundary in case of collapsing when the steep slope considered
8.3 Turbine 51,52 & 53 will be to close to the farmhouse on Windhoek Por 4 and will cause unaccepted noise pollution which are likely to be more due to the topography.
8.4 There are people staying in the same farmhouse which are on chronical medication for heart and epilepsy. The shadow flickering of turbines 51, 52 and 53 will trigger the epilepsy.

Please see above response regarding the impacts associated with turbine placements.

9. It will kill the bee population in the area which are essential for pollination of the fauna. Report of effect on the bee population by specialist are requested.

At present, this aspect is not covered within the EIA specialist studies, however, your request for further investigation has been noted and will be shared with the project team. It is important to highlight that a terrestrial ecological assessment was conducted as part of the EIA process. This assessment evaluated the broader ecological impacts of the proposed development, including habitat integrity and

species presence. According to the screening tool and field surveys, no species of conservation concern—including pollinators such as bees—were flagged within the project area.

While bees were not identified as a focal concern in the current assessment, the ecological study does speak to habitat quality, vegetation types, and ecosystem functioning, which indirectly supports pollinator health.

10. Further the proposed Sheepmoor windfarm are going to negatively damage the character and scenic views of the escarpment and will change the sense of place.

Visual impact assessments have been conducted by a qualified specialist. While any large infrastructure will have some visual impact, the design and placement of turbines aims to reduce the visual impact where possible.

11. Therefore, we apposed the proposed Sheepmoor windfarm in the strongest terms.

Your overall opposition to the proposed Sheepmoor Wind Farm is noted and will be included in the Final Comments and Responses Report submitted to the competent authority for decision-making.

Dear Mr. Meyer,

Thank you once again for your participation in the recent stakeholder engagement meeting regarding the proposed Sheepmoor and Emvelo WEFs. We also appreciate your patience as we compiled and reviewed the meeting documentation.

Please find attached a copy of the meeting minutes and the full transcript of the session. These documents reflect the discussions held, including your contributions and concerns. Certain sections of the transcript were relistened to and translated from Afrikaans to English to ensure clarity and accuracy.

Should you have any feedback or wish to propose amendments, please feel free to reach out. These minutes will form part of the official record.

Kind Regards,

ERM

EXTERNAL MESSAGE

Hi Lucien,

The purpose of the meeting was to address concerns of the I&AP's regarding the proposed Sheepmoor and Emvelo WEF's. The applicant gives the impression that they are not interested in taking any action regarding the I&AP's concerns and attend it only to avoid negative reflection. Therefore the meeting created unfortunately more questions than answers. Your EAP's input was also disappointing.

We urgently need clarification and answers on the following

1 - The EAP is expected to participate and actively engage with the impacted community. Why has my request for a meeting since February 2025 repeatedly declined and pushed in at the 11th hour?

2 - Do you as EAP feel that the process has been credible and transparent as well as accountable in circumstances where you reach out and respond to a request for a meeting at the 11th hour? How is that considered to be meaningful and in the spirit of the constitution?

3 - Why are biodiversity related issues only being property investigated at the 11th hour although the Provincial Department requested it in the scoping phase?

4 - Why are requested documentation regarding the additional 3 months extension granted by DFFE to the applicant still outstanding?

5 - Are you as EAP confident that the data and modelling that has been undertaken to address bird related impacts and specifically the martial eagle is accurate and credible? If so, please explain why.

6 - Are you as EAP confident and can you confirm in writing that the data that is being obtained in relation to the martial eagle was correctly obtained and in accordance with all minimal standards and legal criteria?

7 - Are you as EAP comfortable that if the tagging of the martial eagle were done without a valid permit, that the tagged data can still be used in the specialist report? If so, please explain why.

8 - Are you as EAP in acceptance that the permits to tag the martial eagles, also the one at Verkykerskop, were not presented at the meeting? If so, please explain why.

9 - Are you as EAP confident that all the recommendations in the specialist reports and specifically the Social report are satisfactorily addressed? If not, please explain why.

10 - It became clear in the meeting that none of the affected landowners are prepared to allow the proposed powerline over their properties. Are AEP comfortable to support an application without a secured powerline route?

11 - The avifaunal specialist signed a NDA (non disclosure agreement) with the applicant and it was also revealed in the meeting by the applicant that they collectively determined the shaped exclusion zones for the southern bald ibis. Are you as EAP comfortable that it is not in contradiction with the declaration the avifaunal specialist signed as independant specialist? If so, please explain why.

Due to the time constraint answers required before the 11/08/2025.

Regards

Dear Mr Meyer,

Following discussions with the applicant, unfortunately it will not be possible to schedule a meeting prior to 1 August due to limited availability.

However, we would be pleased to meet with you on Monday the 4th of August 2025 at 13:00, as per your request, at your farm.

Kindly confirm whether this date and time are suitable, and please advise who will be attending the meeting from your side.

I will continue to provide you with the requested documentation ahead of the meeting.

Goodday Lucien

Proposed date for the meeting seems to be too close to submission of comments which is already 9/08/25.

Can you arrange the meeting for us before 1/07/2025.

Can you in the meantime forward the detail previously requested

- All the documentation with Department concerning the 3 months extension granted even after time lapps to submit final report

- Mulilo's permits to fit telemetry device on the two martial eagles

- AfriAvian motivation for altering Figure 33 in both avifaunal reports

Above info are urgently required and no reason to wait for the meeting

Regards

Josua

EXTERNAL MESSAGE

Goodday mr Lucien Barbeau,

Referring to your email dated 7/04/2025 it will be appreciated if you can arrange such a meeting urgently before the 9/08/2025 with the applicant, Mulilo, on site.

Concerns as previously raised with Mulilo in an email dated 19/02/2025 will be on the agenda. That request for a meeting was refused by Mulilo.

Another urgent item which also must be discussed is the tagging of the two martial eagles. According to the MTPA report in my possession, the martial eagles were tagged by Mulilo without a permit. Copy of the report can be provided at the meeting.

That leaves the tagging of the martial eagles illegally, if not criminal.

Therefore the data being used in the specialist report is illegally obtained and all sections, models and references where data has been used must be removed from the report.

Looking forward to your urgent response.

Regards

Josua Meyer (I&AP)

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA

Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Jan Roberts (Affected Surrounding Landowner)

Braam Moodie (Affected Surrounding Landowner)

Jan Vorster (Affected Surrounding Landowner)

Pikkie Vorster (Affected Surrounding Landowner)

OVERVIEW

Lucien Barbeau

- Facilitated the meeting and explained the EIA process and public participation timeline.

- Clarified the role of the Applicant and the legislative procedures for project approval.

- Confirmed that the final EIA report (FEIAR) is expected to be submitted to the Competent authority (DFFE) for decision making by August 25, 2025.

- Acknowledged stakeholder concerns and committed to formal responses, which will be included in the Comments and Responses Report (CRR) to be included with the FEIAr documentation.

Josua Meyer

- Raised concerns about lack of consultation and delayed responses to emails.
- Raised concern that following the end of PPP, and him submitting his comments/concerns in writing, he would not have another chance to respond to the appliucant/EAPs responses to his comments raised.
- Questioned the status of the permit for the bird tagging and data usage in the EIA.
- Emphasized the importance of preserving biodiversity and traditional farming practices.
- Requested formal documentation and clarification on project boundaries.
- Expressed frustration over communication gaps and lack of specialist engagement.
- Requested to be supplied with all documentation around the initial extension request refusal and subsequent extension approval
- Highlighted the emotional and ecological value of the landscape and bird species.
- He emphasized that these birds fly between farms, covering distances of 3–6 kilometres, and forage in grasslands for worms and insects. He expressed skepticism about the accuracy of the specialist reports, suggesting they may be computer-generated and not reflective of actual bird movement

Rebecca Thomas

- Explained the biodiversity offset plan and its inclusion in the updated EIA.
- Clarified the rationale behind the extension request and new specialist studies.
- Acknowledged communication lapses and committed to follow-up on permits and responses.

- Confirmed that no infrastructure will be placed without signed servitude agreements.
- Addressed concerns about visual impact and turbine placement.

Andrew Pearson

- Provided technical insights on biodiversity impacts and offset ratios.
- Discussed the need for multiple seasonal surveys and specialist assessments.
- Explained curtailment strategies for bird protection and turbine operation.
- Confirmed that monitoring will continue post-construction to assess bird collisions.
- Explained the need to include power line alternatives in the EIA process, and that proposed power line routes are not final and the layouts are unlikely to be approved, even if the EA is approved. Explained that further amendments likely, bust on changes in route due to technical reasons and landowner engagements, and that landowner servitude negotiations typically happen after EA approval, later in the project development lifecycle.
- Acknowledged that emails sent by stakeholders to Lucien are being incorporated into the formal comments report as part of the EIA process. He noted that responses to these comments will be provided, and confirmed that stakeholders had requested to review these responses prior to the final submission of the EIA documentation.

Lloyd Barnes

- Clarified mapping discrepancies and project boundary updates. Lloyd clarified that while specialist maps may depict broader areas assessed for biodiversity and environmental studies, the actual areas evaluated have remained consistent from the Scoping Phase through to the EIA Phase. The change involved reorganizing the properties from three projects into two, with no new areas or properties added.
- Discussed the sensitivity of intact grasslands and rationale for offset plans.
- Explained the role of specialists and the importance of landowner engagement.
- Addressed concerns about fire risk and insurance protocols.
- Provided details on turbine placement and visual impact mitigation.
- Addressed concerns around avifaunal mapping and rationale.
- Noted that weekly collision monitoring would be conducted post-construction. If excessive bird fatalities are recorded, mitigation measures would be escalated, including potentially shutting down turbines during peak bird activity times.

Anton Lohse

- Explained the legal implications of servitude agreements and option contracts.

- Confirmed that landowners have the right to refuse infrastructure placement.
- Clarified that no expropriation is possible without consent.
- Discussed the financial and legal hurdles required for project approval.

Braam Moodie

- Expressed frustration over lack of registration and consultation, stating he had not received or reviewed the extensive documentation (referenced as 5,000 pages) related to the project
- Expressed concern around the powerline placement through his farm due to ecological and farming concerns, requested that the farm border be followed instead.
- Raised concerns about specialist credibility and project transparency.
- Asserted that he only became aware of the project in April 2025, and declared his opposition to the development, stating he would take further action.

Jan Roberts

- Shared insights on rotational grazing and fire management practices.
- Highlighted the ecological integrity of his farm and concerns about turbine placement on his farm.
- Discussed legal and procedural issues related to previously signed option agreements.
- Requested exemption from project obligations and raised concerns about fire liability. He expressed deep concern about fire risks associated with the proposed wind energy development, particularly in relation to liability and insurance coverage.
- He highlighted that South African law places responsibility for the spread of fire on the landowner, regardless of the cause — including arson or electrical faults from infrastructure such as Eskom lines.
- He shared a personal example of a neighbouring farmer who was financially ruined due to a forestry claim, despite having insurance. This underscores the potential inadequacy of standard insurance policies in covering large-scale fire damage.
- Jan also pointed out that government-owned farms in the area lack firefighting equipment, and that local fire authorities are ineffective, leaving farmers to manage fire outbreaks on their own.
- He stressed the need for formal agreements and clear fire mitigation protocols between the project developers and landowners, especially once the project transitions to Eskom’s operational control.

Pikkie Vorster

- Raised concerns about bat monitoring and specialist engagement on his farm.

- Questioned the accuracy of specialist reports and their relevance to local conditions.

LUCIEN BARBEAU

It's iPhone. iPhone recording that the transcript. And then I'll share the meeting when it's and transcript with everybody. And my interest is still with the whole project because of our b of this landscape with the r, birds and plants that we have here. And yeah. Okay. So before we continue with actual concerns, let's just can I just do a round of names with deductions first. Okay. Can you go search?

Anton Lohse

Yeah, so my name's Anton Lohse. I'm one of the commercial legal advisers at

Andrew Pearson

M. Andrew Person environmental manager.

LLOYD BARNES

Afternoon, Lloyd Barnes on the project developer, on the Emvelo and sheepmoor projects.

REBECCA THOMAS

Afternoon, Rebecca Thomas, I'm the director of Project Development, so overseeing all projects in the med pipeline from greenfielding through to financial close. Also, welcome to speak afrikaans, I understand it. It's just when I speak it, you're probably gonna want to speak English back to me. So I just want to shout out to let you know. Are you?

JOSUA MEYER
Yeah.. Okay. Okay, Foster..

BRAAM MOODIE

Introduces himself

Jan Vorster

Introduces himself

PIKKIE VORSTER

Introduces himself

LUCIEN BARBEAU

Okay. Right, here we go. I've got it out of the way. Um, Mr. Mayor, would you like to begin raising your comments and concerns to us?

JOSUA MEYER

I think the first thing is, if you can just explain, because we're not so familiar with all this this, inquisition and definition and duty in this.

LUCIEN BARBEAU

Okay. So as these two parties. Yeah. It's a developer and it's a land. Yeah. Okay. We only present a couple of land another land of the certainly. Well, they want to eat. Okay. Okay. So, I represent the ip for this project. So this is for a proposed wing form in this area, right? And Belo has appointed UM to conduct the legislative process for getting this being form approved through the pa app. Right? So Mario cannot do it on their own the leader representative that will allow an unbiassed way of going through the legislative process. We will always go through the proper procedures to follow for this process to be hard liable for the authorisation of the project shouldn't get to authorisation, right? The currently the project is at its draft, EIA phase, where we are currently in the public participation period, where if the INAP has an opportunity to comment on those reports that were released to you. Was it via email. So at this point here, by myself, I will be hearing your concerns, and the response is made by Malo and noting them down, just f verifying whatever applicant is saying, whether you be saying, can be heard. So, yeah. Thank you. Okay, this is the, I think. And then afterwards, Afterwards, you your comments will be firmly processed into a public participation report where the applicant or the he will respond to that comment and make a necessary changes to the project or justify the response that you have made. Okay. And as public won't have again to comment on their comment. their response? Because we are reaching the final process, the final report will be released, but this will be for viewing. There won't be a chance to comment, it will be a chance to appeal only after this point. Now, so this is basically the last time time that the game. Yes. After this point, you would have this point, the final.. When you date after the final The final will be released on the 25th. 25th of August. Yes. 2025. Okay, it was supposed to be in March, April. Yes, April. Apparently, there was some change of time and there was lapse of time and there was some stuff during going on between, I don't know, between Leido or a younger you, are In the extension, no, not bite, but I was Milo.

Lloyd Barnes

Yeah, okay, the reason is,

JOSUA MEYER

we ask for the reasons why, and we don't get anything.. It really, is a formal process. The corresponding is flying around.

REBECCA THOMAS

Correct. Yeah. So in April, we also met on site with the provincial department, and the parks in tourism agency, as well as in DARDLEA, the agricultural land rural development, yeah, where we presented the project, the phase we're in now, we presented it to them with the findings, the specialist findings. At that stage, when we were on site with them, they raised a concern about who report this, and that's obviously come up to all the special studies. So around critical biodiversity habitats, CVAs anti grasslands, etc. And while they were reported on, there was a question whether or not we should be considering what's called biodiversity or set plan. So we hadn't proposed a m university order also plan, we had proposed what was called. On side restoration. biodiversity management Plan, which was on site restoration on areas of the farms not being utilised by the actual infrastructure. So when the request, then the department also submitted therefore, formal comments in that period, submitted to this period now, and they basically said, and there is also biodiversity or set guidelines. And they said in terms of the guidelines, we feel biodiversity or set plan should be considered. So that's when we requested to the department of environment for an extension so we could include a biodiversity of set report. Workap in b legally, if you're introducing new information, then you have to go back to the public again. So and we have two choices to either get asked for an extension or essentially also in the legislation, there's a mechanism where the project can can lapse and you start back where it was lost approved by the Department of Environment. Either which or you say she started the same point being putting out the draft report for going pro you again. And that's how we got to the second making a report again available. For a review edit it now includes this report, which talks specifically about setting aside site of land relevant to size of land that impacted, but then we have to set aside, compensate, and put biodiversity offsets on that equivalent, you know, area related to the intact area.

Andrew Pearson

An offset is usually required when there's impact on either CBA1 or CBA2 or CBA 2 and then also on Intact grasslands. So not all projects actually have a physical footprint on those. So we would prefer to avoid those as far as possible, and where

it's not practical, we must acertain whatever area of impact that we do have on those areas. Thenthere's a ratio, I think it's 50 50 to 1, land that there needs to be in form of a protected environment or a reserve or some form of stewardship protected area, for the offset.

JOSUA MEYER

But wasn't that (i.e. the need for an offset) raised before?

REBECCA THOMAS

So it was, yes, and so No happy, bad pressions. No, no, no, no. No. So the biodiversity are also guidelines are also relatively new. You can probably talk more about that. Everything you about. Yeah, I. So, L like, Andrew said, CEAs and ESAs, et cet, are very clearly defined in the biodiversity of Management Plan. Intact grasslands was a bit loosely defined in terms of the spatial biodiversity plan. And essentially, it wasn't it's not like a set out in the biodiversity of set guidelines. doesn't doesn't talk to intact. doesn't talk to intact.

Andrew Pearson

I think the need for an offset came after our engagements with the provincial departments who pushed us for it.

REBECCA THOMAS

And we had done the biodiversity management plan, which we consulted with the specialists, and the specialists were in their opinion opinion that this was a suitable mechanism for the impacts in the intact rascals

JOSUA MEYER
There's, there's a lot of. Yes, yes. So it's 5530 then you and then you've got great depth this up, there's another 10,000 and that's because degree in 30 days.

LLOYD BARNES

That's a challenge.

JOSUA MEYER

And then we still have to run our own business. Yeah. So we might open your feet. So I might ask questions. That's not that is in the report. Yeah. But I didn't feel free to or anything happen.

LLOYD BARNES

You know, I think another important aspect is.
Intact grasslands layer in Mpumalanga is a particular area that the government has mapped only within Mpumalanga in terms of their management plans that direct us where to go and where not to go. There isn't much information with regards to these intact grasslands as to how much you must avoid them.
And they often states the very similar approach amongst all of their mapping that this is, you know, high level, but you need to do your specialist assessments. That's a large province. You guys need to go there and show us new assessments that maybe this isn't of a high quality or maybe this is a high quality.
Up until the point with the meeting that we had with these two government departments, we weren't. We were of the opinion that our assessments were strong enough to show that these areas were proposing aren't of such a high sensitivity. Due to the grazing and due to the alien vegetation and the current land uses, we then had to make a decision as to whether we take that chance that our arguments is strong enough and submit for a decision or be more conservative and go through this formal offset process and rather submit that with our final and say.
OK, we've heard what you guys embraced first in this meeting. You're concerned about the sensitivity of these grasslands and we will go forward with a biodiversity offset report, the initial screening and sensitivities, which came out in the scope and some of the special sports or a lot of them haven't been completed. They've maybe done one season.
And you have to do multiple seasons to go to the grasslands to check for the bulbs, to check for things like wild orchids and stuff like that, which does exist on the site. And that's been our motivation for going forward with this offset at this point with our final submission.

REBECCA THOMAS

I need to conclude on that you just for. Yeah, Mr Mayor, who is the specialist? That's

a racial specialist. OK, James, code. So. And what? What? There's the implement on the layer and when.
When specialist went to site there was a lot of what shows intact grasslands. When you went to site to the actual detail mapping within intact grasslands showing areas for instance, where there's the black water or investigations and demarcated it.
And that's where we said we would rather do restoration and management of like the black wattle and that sort of things. And and when we said some lot of the land was also impacted by grazing. So it's it's no longer got the same integrity.
As a as a natural impact throughout grassland, but that in pomalanga on that meeting said while that may be the case on site, it still serves a purpose. And then they made that argument and that's where at the end of that.
And at the end of that comment period, we sat down and said, OK, what do we now be with the comments and that's when we decided look.
The the idea is we we're getting the sense that more needs to be done.

JOSUA MEYER

is that formally done you're writing.

LLOYD BARNES

Yeah. With DFFE. Yeah. Yes, of course.

JOSUA MEYER

Why didn't they want to see? Because that. Sorry.. Why didn't they share that? The can documentation of us.

I'll ask you. I'll ask you explicitly what happened. What was the reason for the thing? Because originally he was like for us for extension done that.
I saw I saw a data from.
From P with P with PHAP at the time lapse and but then afterwards I'm getting a letter again. Now. Yeah. OK, so we we just ask him, can you just forward? I said that's. That correspondence, but it should be all of us.

REBECCA THOMAS

No. Make a note that we please get back to them on this. That there was notification, if I'm not mistaken, Lloyd of the extension.
Being granted that went up to.
Equally, there was a notice and happy to to discuss it. Prior to that, the department had issued a notice of the.
Extension being rejected, which we said that's fine.

JOSUA MEYER

Oh, OK. Yeah. Because the time. Yeah. Just correct me. It was.
All that helps.

LLOYD BARNES

No, no. So I think in terms of the application to extend the legislated timeframe, we submitted our application within our legislative time frame and the initial request came back rejecting it. We then went back to the DFFE and requested further information.
And then they're subsequently approved it.

JOSUA MEYER

Jamie Poats also just issue on the grave.
The reason why is grazing is going down, of course. We're not allowed to defend the field at the right time. What just do you think those and look now we?
He's doing his fibre right. That's one of the best. You must. You must, when it will be at the right time or nothing down here.

Andrew Pearson

By who? By the authorities.

JOSUA MEYER

Now the farmers fire. What from? From association violence. Yeah, it is. Is there internal flow? I felt probably to free. Yeah. Yeah. The only process supreme of crossing.
Yeah. OK. Interesting. And so that's all. I just, just, just just just a comment is that all album?

LLOYD BARNES

No, no, no. And I think those sort of plans need to come into the wind farm as well. If we're going to have an operational wind farm and the farmers have plans around planned buyers and fire breaks and fire regimes, you know that's something that we would have to get involved with as well and ensure that we don't get in your way for any required domains.

JOSUA MEYER

Yeah, those fits case in the past it was, there was a problem that helped nothing to do, OK, because he always thought of the helpfire and right. Basically. Right. Yeah. I'm very good honours of actors and don't appreciate it. So he burned down, right. I guess if we're not saying anything about fountain,

Anton Lohse

yes, I need off, right? I I think no, as if he wants to fountain. I came back by the OR scene and I said it and said so there's near the 20s where?
Yeah, fine. But yeah, is. Is it a good practise just to come and speak to the the land, you mean the the the station?

JOSUA MEYER

We're not specialists, but we a little bit more philtre.

LLOYD BARNES

Yeah, I think definitely and you know, and I think you might have had quite a number of conversations with some of the phone in mind and some other specialists, some of the specialists will get more involved with the land owners like the socioeconomic specialists where they will come and do actual interviews with you guys and we understand that you know exactly what's happening on the farms, and these sort of public participation engagements is also to cover that fact that the farmers and whoever's occupying the land has experienced and knowledge of that land that no one else has.
And these public participation opportunities and phases are there to allow all the farmers and anyone who doesn't, even if they don't own the at the farm, but they live in the area, they can look at a document and say no, this is incorrect or this is correct. You've missed something here. You haven't found something there.
Because it is recognised that your knowledge of the land for surpasses and you know what is a specialist is limited to obviously their knowledge, their expertise and their time. But it's not short of an audience but.

JOSUA MEYER

To come back to strong, there are only specialists that inform us of visits. They that didn't come to talk to us. We go to them because that will be playing on the cell phones, feasible specialists. It's the only guy that I have.
Contact with the other two guys.
There was no meeting children for me. Young asked me to. Prominent and to witness and that's where I met Scott. Interesting. I think that's something we've you're working.
The station is really coming, right, right, by saying the report. There's no.
Evidence of potential I'm especially thinking about it back there. The best specialist. Yes. Alright, let's see the best specialist. I wonder. I think he's surrounding it from all holldand
Of course he's thinking. I've been showing both minds on Mr forces. Four, it's 55 minutes.
Well, it is best not all of the events, but you see, that's what I'm saying. Yeah. Yeah.
Andrew Pearson Then can you please share that that information

PIKKIE VORSTER
because on the report is that there's no case, no area. But why there's five.
Andrew Pearson
Yeah, I think that's sort of talk to the bats, the bat specialist, they do have a database of bat colonies in the country of known major colonies that they, they do look at that. And yeah, they also.
Put up a boss. That master call. Yeah. Yeah, yeah, yeah. But the location of the cage other than boss, he's there is no beyond. There is on there is.

LLOYD BARNES

So I think that the bat specialist report will go into this. How different habitats and different sorts of environments are they assessed? Yes, because I haven't updated. Yes on the new. So I think maybe the final year AIM was just emphasise those bad locations and how different habitats were assessed.
And I think internally and one thing Mulilo can take away from this is that we will encourage our specialists to engage with the land owners a bit more, sometimes specialists when it comes to site them and do their thing, they don't want to talk to people. Some specialists like to talk to the farmers, they have their own ways of doing things.
But I'm very much of the opinion that, you know, the farmers and occupiers know a lot and should definitely be consulted directly, at least at the beginning to understand this opinion. Tell me where's eagle nest? What can you know? Have you seen any of these antelope on your property? I mean, that makes sense. So agree with that.

JAN ROBERTS

Just to come back to the grazing problem and the fires and things like that, that's not the only way to engage in in, in management of of of, of grasslands.
Force controlled force feeding rotation.
Has a better impact on the because it does no heat damage to roots and other plants between the grass I have. I'm on this farm for 26 years now. I haven't burnt one pedal.
In 26 years, I was burned by arson and run away fires from from neighbours and stuff

like that. And you're welcome to come and check my, my, my felt at this stage the the, the quality and what it is there. There's no. There's no sign of over.
grazin

LLOYD BARNES

can you can you explain how that how you how you, how you manage that, the controlled forces raising rotations,

JAN ROBERTS

rotational yarn and also.
I have extra land to to allow the amount of of cattle on my farm. It's far above the the the the average specified 3 hectares per one large animal.
I'm double on that because of this rotation of of thing and keeping the fires away. The fires kill all the good grass and the rough stuff take over, so yeah.
Yeah. That I just want to mention, just don't look at the the overgrazing and and things like that. It's caused by arson. The most is caused by arson, fires and escom short circuits of their lines in the whole area.

LLOYD BARNES

Thank you. Minya,

JAN ROBERTS

the experts are not the yeah. Theoretically, the experts.

LLOYD BARNES

I think that's a good point. I mean, arson and runway fires is something that a lot of other farmers have -

JAN ROBERTS

So. So now that allows another guy to put a foot out because.
Arson and thing is because of bad governance through the government, bad policing and all that type of stuff.

Rebecca Thomas

Sorry, I want to. I just want to make sure I'm getting the point on the rotational.
In that my understanding, on another project a few years ago, one of our land owners, that sort of like the spiral with the.
Sheep from camp to camp. Then it allows the grass to recover and you move back to that back to that camp over the time, and we can get there. Then it's recovered and then the cycle starts again. The understanding correct, similar sort of understanding that you move them so that the grass recovers.

JAN ROBERTS

Yeah. OK. And you you by by visual inspection? I do it by when? When my the the the length of my drawers gets to a certain stage. I move the animals.. If I don't have to move, I reduce the animals.

REBECCA THOMAS

And why? I just wanted. So what was interesting with that landowner is that he said if we're going to do a wind farm, he needs to be able to maintain his caps and his rotational forced feeding.
And that was that was well understood and definitely catered for. So is, is that also just?
Saying like, is that something that needs to be considered? If you are, you know, proposing developments that we still want to be able to farm in our usual farm manners and practises etcetera.

JAN ROBERTS

Just repeat the last

REBECCA THOMAS

is is the intent that regardless of what development, just that that the land owners and farmers can still maintain their usual farming practises.

JAN ROBERTS

Possibly because the other.
Things that come to you a a winter button.
Increases the ground temperature by two degrees. The two degrees takes away the dough and the dough is a natural moisturiser of any plants that grows.
Yeah, I think and that report was was not a report. It was not a a impact study that one of the MULilo guys, I think it's a Johannes Johannes send me a pamphlet of These different things.
The other one is pollination. These were never done on the impact on the last.
Report before you finalised I from my side, I put in bees.
They will not think I got a pamphlet from a subject quoted by a Frenchman in France that they don't do harm to bees. That's not in impact study.
And France, BS or not, the Africa B. So a definite impact study is is required.

JOSUA MEYER

I did want to clarify. Yes, Sir. Yes, that seems to be you have got to cover the things. In pain.
Yeah, some.
Your market like that the others got this added. I don't know if you wanted to get this. You're right to the project boundary. Yeah, the project boundary is from other added, yes.
So this is the the one the one is overlapping with Chief. Yeah, that's I'm not saying correct. That's the.

Lucien Barbeau

That's the new boundary that we now received from Malilo for the for the which before we were going into the final this is the this is the layout and the boundary that will be presented.
Entering the final,

JAN ROBERTS

but there is a problem. You can see you're going to see between cheaper and where. OK, so they said they said please. That's overlap. OK.

JAN ROBERTS

Do you want to have come have a look?
So.
Do you have the? Do you have the other map? This one? Yeah. You can have. No, no. Do you have the other one? This. This only shows on dealer at the moment. Yeah, in villa.

JAN ROBERTS

But sheet more is. She becomes like something like down like that. No. No sheet more.

Lucien Barbeau

Yeah. Yeah, they now share the land motion.

LLOYD BARNES

They share an implication they share in the access Rd with Shard through that app.

JAN ROBERTS

OK, yeah. Is that the new implication?

Lucien Barbeau

That's. Yeah. That's apparently what's on the. This is the one that the latest one you viewed is as well the Sony.

JAN ROBERTS

But what's fishing is this.
Aware in one way aware. Yeah, I know. I know.

LLOYD BARNES

So. So I think a lot of the specialist maps and there has been changes throughout this process since we started even having frequent forms and then having to drop the second the one.
And a lot of the specialists mapping will show much broader areas that they've assessed because they have to not just the project area, but not just after that. So a lot of their mapping would have much larger areas that they would have assessed. But the turbine locations and infrastructure and the roads and everything proposed will be the same throughout all the reports.
Whereby maybe the project boundary that they assess would be different, much larger, and the actual project boundaries in the application is limited to only the properties that are going to help infrastructure on whereby the specialist sort of assessed areas for this biodiversity offset report potentially.
Some much large areas where we previously were proposing to develop and then drop those areas. So those maps might still follow through to what you may see now. But what is in our application and our infrastructure positions is the same throughout all.

JAN ROBERTS

But so basically there's no.
Material impact?

LLOYD BARNES

No, no, there's no material material and the layout that we submit for our final decision making and not to get too much from what we currently are posting.

JAN ROBERTS

So these are that's why I'm saying you're looking, but they have some new information.
Report and the yes. First draught report. Yeah, it's the total buckle, citizens. Yeah, we are sorry. Yes. Discovery before the connection for our voice.

LLOYD BARNES

It's interesting. It's interesting. It's actually an interesting conversation because because,

JAN ROBERTS

yeah, my comments on the scoping, yeah. So it wasn't so critical, but now you come and yeah, which is right on my doorstep.

LLOYD BARNES

So in the need of my EIA process, the scoping phase is very much designed for what it is to scope what's out there and to find out what.
Legislation is applicable in the past as an EAP. Sometimes we would even hesitate from putting specialist reports after scoping decisions and comment because they're not finished yet and they're giving very broad information. So there are a lot of changes throughout scoping to final ERA and it's almost like a cake that you cuts

away cuts away.
And you eventually you're left with an OK, maybe one or two little problems that you now have to put twin farms, so that process does change. And I think I said Melilla again, should acknowledge that that should have been explained a lot clearer earlier in the process to our farmers who are new to these sort of.
Processes and I think that's something that we can say bring forward

REBECCA THOMAS

I think yeah on on this and it's not wind farms are particularly unique with the sort of movement between scoping.
And final and bearing in mind we are subject to this legislation, national Environmental Management Act, which has restricted time frames, you know, and it's gone over changes over many years and they're getting, it's getting more and more robust success but.
The end of the day you start, you know, we look on a map. It's as simple as that. We look on a map and that looks like it could be good wind resource. Nice close to electricity. And then when you get there and then there's, then there's a process from a development in terms of you have to get permits. You have to apply for different. Good things at different times. So we start the process with this area and now we started the time frame start on the NEMA act and you do your scoping. I think there's the airstrip that impacted a lot of our original placement.
So literally within the first 3-4 months when we had a project this size, you know, we now have a project this size because we went to science. Yeah, and now it's that size. So the process, while frustrating it is, is the process itself is almost written to the fact that as and when an information comes to light, you then must account for it.
And take it and address it and then the project goes from this to this to this and I understand. I think my point on this particular project in Pumalanga just.
Yeah, it's also pretty new territory for for the renewable energy space and with this particular project and the likes of intact grasses different, we're not dealing with the northern Cape here, right. We're a lot of the legacy projects are.
That it it's been a lot more complicated. So you know I understand that's it's I can understand how it can be frustrating and complicating and you're seeing this to this to this.

BRAAM MOODIE
As am I sitting here I don't understand anything, im very frustrated, I am from the farm Windhoek part of 3,4 and 5 Rietvallei up to Sheepmore. You spoke about 5000 pages which I have not seen before. Our land was not registered as IAP for the whole process. I've sent an email in April to be registered for the whole process. It seems that you look at a map and draw the line and this runs right through my farm. We are cattle farmers and there are no trees Colesbay has more trees and there are more trees to be removed. That is the reason you want to put up the powerlines here. Last week was the first that I heard of this, and I am completely against this and will take this further.

JAN ROBERTS

I spoke the first time when I approached it with me is the draughtsman, but there was an important.
Now with the new I opposing the they just draw the line there.
And I OK, he has a woman here who use different words here to put that down on there. I will see there's

BRAAM MOODIE

no way for this power line to go together from this site.

JAN ROBERTS

But when they draw it, yeah, I was thinking yes.

BRAAM MOODIE

Through our land there are windmills, mielie lands and what you mentioned earlier is true…you sit in the offices and make decisions. The only person who came to consult with me about these turbines is a Mr Le Grange, Christoph, 4-5 years ago and I then said I am not interested. We farm here and want to do so this the right way. Here are lots of Sekretaris birds and it cost us almost R300 000 to get rid of black wattle and

now it is the new thing about the turbines. I just don’t know – who is the specialist? During great day come and be a specialist in the high field.
It's a joke. Another joke. It's a changes now. They claim it's an additional info for the farm.
That hasn't with that info on your farm
It it was the income work out. Therefore pick up the infrastructure, the movement of people, you you keep in unproductive farmers on the land.
Because if you can't make, you're getting up. It's a of of my fault. The mistake, performance and.
Now you're keeping unproductive people. That's not even sitting on the farm. You keep them there on the farm because now they can't believe them. Now there's nothing happening there.
Where is the food coming from? If not, we're going that way. It doesn't just happen here. That's 80% the same. The same situation. Somebody in there.
At the farm in the farm? Yeah, she got no income. Only a small hire . And now they're putting windfalls on. Now she's got money.
Is it? Yeah, I'm saying what I'm saying this and I see that guy is striking all over this to involve. It's from the Cape.
Who's your our specialist? Yes. And your online. Your hand line? Yeah. I'm not even commenting on it because you you cannot argue to be false anymore. It's done. Hopefully, except Mr Trump, he said. Do you something about it?

Andrew Pearson

Yeah, OK. This one, I just wanted to work with Mr Moody. Yeah. First to the the power line and I feel that communication could have been a lot better.
And I think it's a good opportunity to explain the the process in terms of power line. So is that all, is that the 132 KV that so yeah, I think 12K. Yeah, so that that will be the 132 KV route that will connect the the wind farm and especially.
Yes, only and it will be a single monopole and and how it works is it will be authorised if it gets authorised. That's still wouldn't it a big gift if it gets authorised it will have its own separate EA environmental authorization will get separate.
Approval, because that will eventually be handed over to to Eskom so that the wind farm will construct the the power line and then hand it over to Eskom before before, before any of that can happen.

We would have to do servitude negotiations with the with landowners, so the route an authorised route does not does not equal constructed routes What we do at this stage of the projects development is one of the first permits that we're trying to obtain is the environmental authorization because without that we can't bid the project into into tenders, into the REEIPP programme or into.
And, you know, begin to gain negotiations with the private offtaker. None of that can happen. And without the environmental authorization, once, once we have the environmental authorization, it's only once the project becomes what they call a preferred bidder.
Where it's actually been selected by either by the Department of Energy or Private offtaker . Then then you go through another process to reach financial close and that's when we do servitude negotiations.
If the routes seem to change, we will then have to do environment EA amendments and layout changes. We'd have to change the route and investigate, investigate new routes. So during the first EIA process, we choose among we choose an alternative we choose.
Technically, what looks like the best route technically and we we have to put in a few alternatives, but you'll find if if if they're given yeah for the project they usually say. As a condition that the the layout the final layout is not approved, you must resubmit it in the future for for final approval because they understand that there's a lot of detailed design that still needs to happen with engineers and detailed design works. And and that that only does come later in process. And so yeah, we even even with that we we still have to negotiate a servitude. So they would still be servitude You've made it there there there has to be a servitude agreement with the land owners.
And and this is not binded as yet

Anton Lohse

We are not there yet in that part of the process yet.

BRAAM MOODIE

In the end, the land owner – whoever it may be can determine the route. You wont necessarily take the shortest route? In that instance, I would've suggested should it come to that, I will oppose absolutely it. Go to the border, completely on the border,

I don’t even want to see it cause it affects your cattle bulls fertility. The powerlines, Im busy with an investigation where they studied it in Norway, and suggested it affects the bulls fertility. So those individuals must be separated and fenced of to one area.

Anton Lohse

So just in connection to what Andrew said; that is a negotiation and a negeotiative process – so you wont be able to fence off a servitude road if those agreement is not in please. So can you negotiate, what works and what doesn’t work? And again, a person looks and assess what can work.

BRAAM MOODIE

But they definitely didn’t come to look in that area.

Anton Lohse

No, I understand that but at the time the tar is being laid, is the first; remember its an alternative route so then the process only begins, and its a negotiation process. – may not be the shortest route either. In my case if I may suggest if it comes down to it – although I will oppose it – completely on the border – I don’t even want to see it, because it affects the fertility of the bulls the power lines – they are busy with research in Norway that this is what happens. So the lines must be drawn aside.
So it is going to be a negotiation process so you are not going to get an easement if it is not agreed upon.
What works and what does not work.
We do a lot of this stuff. We try to always get alternative, I don’t know of one of our projects where eskom did their own thing.

LLOYD BARNES

The substation location, because it's updated location about brothers. You clicking my brother. OK, the. So this is the on site based on men and wooden farms. Substations. Yeah, obviously at the top of their spotment. I think I can see here.
I think that's on. There's one year. Sorry, sorry, sorry, sorry, yeah.

But that's on Germany, Kevin. Yeah. Yes. And their property. And your concern is that's going to be too close to your property.

JAN ROBERTS

Correct. OK. I'm quite concerned. But I will already make it. OK on that one. OK, OK. I don't want to take this one.

REBECCA THOMAS

If you do not sign a servitude agreement, we're not going to be putting in power line or infrastructure there. It's different to.
Use the mining the the mineral resources where you know just come and not even negotiate consults and get it at some sort of permit over your land. Then we I'd like you'd see that and not there is no option once you did not see.
Yeah.

BRAAM MOODIE

Im happy you say that because they are going to record it, cause you said it now
So yeah, so we're not bound by. If we don't sign, we're not bind, no.

Anton Lohse

We have no law that enables a private developer to go into some form of expropriation to register a servitude on another party's land and I think what Rebecca now indicated; It's a bit different with mining companies that might gain prospective rights to your land. They have a bit more say in this, cause the law gives them say. We don't have that. So the fact stays, if the landowner or the farmer decide to stand his ground, he stands his ground. Then you have to make a different plan or you have to go begging again, or you don't have a project.

JAN ROBERTS

This is exactly in terms of what I signed previously and what you just said; At that stage the options were signed in an uneducated manner, and then we were stuck.
I am now out of this process. I must now wait and why must I now wait till 2027 to get total exemption from this? This can now influence my estate costs to actually find a solution. I already have a letter to say there in no agreement.

Anton Lohse

I have no background of this actually. I got a short notice but we can follow up and I cant answer you on this right now. What I can tell you and what you said regarding the mining industry, I also place a option of negation on.
What I just want to say and I don't want to actually give advice, but the fact is if you have signed an optional agreement for someone to come and have a look, with an option to develop a wind farm on your land. This does not have any effect on estate or estate planning or something like that. There no project yet, there no value, theres no lease contract, it a personal right.

JAN ROBERTS

What I don't understand from the previous round of discussion, the option was, we couldn't get there?

Anton Lohse

No theres a different between whether you can get out of a certain option and what is the consequences thereof. So your very broad option is option to lease. So I as the developer signs an agreement with the landowner and then we start the studies to see the project can be validated and developed.
Now the reason you take an option, the law is actually quite simple. If you can come to an agreement with someone that you have an option to buy your harvest machinery. If you don't come to terms beforehand on what is the cost, what is the value of the transaction etc. So if you don't determine these things beforehand or come to an agreement, and now you say; I have an option, then you now come to a problem. Then what you do now to have a corrective option; you come to terms on some of the commercial terms in case you decide to develop a wind farm there. And

the reason you don't want a landowner to come out of this, is a commercial reason and that stems from. Look to develop these projects just where we are at now, costs millions. So you don't want to go into the process, put in a few million rand into a project that looks like its kicking off and now the landowner decides to pull out or he lets the competitors in here. So this is the reason why you have an option.

JAN ROBERTS

Sir, sorry can I just inform you? My option that I signed, the agreement, the attached to the option, I didn't sign.

Anton Lohse

Yes but you don't need to sign it.

JAN ROBERTS

Why not?

Anton Lohse

Because, what I just explained to you, is that with that, you only agree to what the commercial terms are. You will..

JAN ROBERTS

But I didn't accept it. I signed the option for them to be able to do an impact assessment. And therefore I was informed.

Anton Lohse

Okay but..

JAN ROBERTS

Then it got enforced further. I have a letter in which they explained that there may be legal action taken against me.

Anton Lohse

Ja I now didn’t see that but I also need to add is that this option and the attachment with the lease agreement, is only enforceable the moment it is signed by the party. At this stage, I am saying that we only come to agreement on these terms. But the moment I start my option, then the landowner still needs to sign the agreement cause these things must still go to the deeds office.

JAN ROBERTS

This is where I got threaten that if I don’t sign, then the legal action will be taken against me.

Anton Lohse

Yes, I will go back to it, but what I want to bring across;

JAN ROBERTS

I now have a letter that its required from me, and I now want final exemption from this. Why must this be kept in place till 2027.

Anton Lohse

I don’t know, I don’t have any answer to this.

REBECCA THOMAS

Yeah, I'm going to make a note and get back to you on this one. I signed that letter. My understanding is that that we had, we were allowing the option to completely lapse. I don't didn't know there was a date to it.
Yeah.

So I will get back to you on that. Yeah, my understanding is we were releasing you from, yeah.

JAN ROBERTS

And releases were released now. Yeah, from the day. But the legislates that it's it will only be totally thing in 2027 if I remember.

REBECCA THOMAS

No, I yeah that's not.
The intent at all now from my side when I was finding it, I was up there understanding that we were releasing you. I think all we wanted to do was put what what was in there saying that your farm is still part of the draft report because it was assessed.
But that so don't be don't don't see that as you're still bound by the option, you will be released and I will follow up with you on that. And if there are different terms, we'll get back to you on that.
But that's not how I understood How we were issuing us.

JAN ROBERTS

So when I asked, you honestly said no. They they don't want to release it because it it'll give more other farmers also the scapegoat to get out of it. So I don't know, it didn't make sense to me because why why?
Was rejected was due to specific impact reasons. Yeah, so so.
Yeah, we may be. Yeah, that's fine. Just to conclude, yeah, I don't put Rebecca.

BRAAM MOODIE

Yes, I think what Rebecca and Anton said now, you know that it rests with the landowner to sign a servitude, but I will oppose the development.

JOSUA MEYER

We all concerned about the change of this, what they call it. It's a nice word. Seems some placement.

LLOYD BARNES

It's a place. It's a SENSE OF place. Yeah.

JOSUA MEYER

This is a unique on this front.
If you need sceneries.
UNIQUE bird.
The plants, what do you call it? I'm not so familiar. I know grass And also they saw mountain reebok last week we saw the other people we saw.
We thought that there was a couple here, the space OK everybody is also here.

JAN ROBERTS

This mountain range is the watershed of the Indian and at the Atlantic Ocean, it's also a known an extension of the Vakistrum World Heritage, which was never incorporated. Why? What reason? What not?
Yeah.
Four or five years ago, we and that's still lying at at at now straight. We we we wanted to register as a as a yeah.
He laid all knee tight and phones it the the, the, the. The sushi is a TV area for for, for answers mark means of those means of working.

JOSUA MEYER

I think what happened was and the lady that.
Help us the team that we're going to be for the race. It's out in fault. No, I I followed it up. It's still in the file, you know, waiting for process because the the other priorities to that, of course.
Beyond the scope, we rely a lot on the the best properties, especially in this

Midsummer Midsummer and also the character that is giving the most.
It's. That's why.
I detention. Yeah, OK, that's why I'm not going to THE CAPE. That's that's what my question.
You won't see the list. You won't get the the deal. And the nicest thing is to sit on the on your land and the MIST IS coming over and you don't see even your sheet in there.
And also the the birds I'm talking about because you see a bit.

LLOYD BARNES

Yeah. I mean, yeah, I think I mean we experienced that sense of place. You know, when we've come to Omolo and I don't cover that as my second home because I'm coming here so often and coming from a farming background itself. And I know exactly how that feels. We didn't have many ills.
Springs so this is flat and most of the smoke was pollution not MIST. So I hear what you're saying and something that's synonymous with wind farms around the world, this impacts on sense of place and in our assessments, that will be something that will have to be considered from a social impact on how does that affect you guys? How does that impact the workers? How does that impact tourism into the area and that must be considered in our final impact assessment and certain TURBINES would have been advised by the visual specialist who isn't who? That is a person's job to go and determine what impact does it have on your view?
Or the socio specialist. How does that impact the sense of place which this this natural aggro feels but and we would have had to move certain turbines or peaks or mountains. So it's not viewed as visible from certain angles.
But I think the high sense of place sensitivity of this area must be properly addressed in the final impact assessments and show how we're going to because we move all the airlines on the 8th water each, yes.

JAN ROBERTS

And I don't know who is that speck of the slopes. How does that work? Because the slopes they say unsuitable. That's the thing. Yes. Nobody came a check. Those boulders this.

They don't need to battle to gain the foundation, they they will destroy the and they can tell you now that some places they have to give you spot, they cannot do that stuff. Converts that point when when they need the detailed design, they'll have to.

Andrew Pearson
To do geotech and they'll have to potentially move move positions away further away from the Ridge so there is a good chance that the that the lab will that the lab

JOSUA MEYER

will shift move it away from the beach. It is in place.
Yes, yes, you will be. What about trying to send it? Yeah, yeah, yeah. And maybe just further on to sorry. Finish. I can show you where the reaches they they move with the 1st to report. Fine.
It's not cursing, and actually one of my comments, please stay away. 1.5 kilometres from my boundary.
Going down to great all my problems actually going down the drain.
And now it's on on the verge of the Ridge. It's 200 metres from the scene, replaced on my form. The waterfall I, the future generation, want to do better vehicles.
Lost me. I don't. I do not people.
He's not anything.

Andrew Pearson

Yeah. And I wish to run that. It's specifically a few few of them.

JOSUA MEYER

The one thing right from I can show you now.
You know this is.
PIKKIE VORSTER

Did you like some? Great. Yeah,

Lucien Barbeau

I'm fine. Thank you. Thank you.

JOSUA MEYER

All this reasonably.
All, all that. Thanks on on the reach.
We have some rooms.
You're going to be destroyed at home and it's boldness. It's not.
And also, Mr Pote, he say no, he's fine. Then staying up the regions.
This is good.
He said Paul, so he.

LLOYD BARNES
So, Jamie, what's that provided some. He did an assessment of that area and he provided areas that are no areas. Yeah, but it's not actually between.
Yes, that you will advise only from a vegetation point of view. You know it's up to us how our challenge will be to construct it and obviously from our point of view, it's cheaper to have a turbine away from the edge because of the amounts of infilling and and works that.
Yes, it's so, so. So for us it's it's I already I

JOSUA MEYER

I can actually where you can repeat it it's all of it's there yes and that is it's on the it's on the edge of it but it's next to the Ibis and then often say.
Yes. Yeah, yeah.

LLOYD BARNES

So the the areas that Jamie had as well as the areas that the important of the governments had identified along that Ridge and how they have maps it as something they call other natural areas.
And as well as the bird, no go areas along that Ridge. There's only really a very small sliver of of space that we are allowed and permitted to put our wind turbines, the

current layouts that we're proposing avoids all sudden hold out of snow, go areas and all any formal no go areas.
We've further tried to reduce that impact and put the turbines a little bit off the Ridge by reducing our blade length so that they're not overhanging and so they're actually reduced by another 20 metres, which will also reduce the visual attacks a little bit because now they're smaller.
And.
It's unfortunate because that is the windiest Ridge in the area, with the most amount of resource and a large part of our intention to develop once advanced on that Ridge is the reason why we are entering into a biodiversity offset plan.
So that the impacts that are leftover after us avoid in those learnings are addressed in the biodiversity offset, which is approximately 550 ha.

JOSUA MEYER

But can you tell me if 300 metres away from a southern Volt of Ibis Kodomi missing sites, will they stay there?

LLOYD BARNES
I believe the ways that we've mapped them many.

Andrew Pearson

I'm just curious to what can you show where the the Ibis. I'm sure we have larger buffers and 300.

JOSUA MEYER

Yeah.
Any other one? And interesting there's one day it's not even recorded.
But we can forward it to the front rate. Great thing.
I don't know. It seems to me that this special report is computerized Generated.
.

BRAAM MOODIE

These ibis’s fly between our farms, its about 3-6 kilometres into our plot. It catches worms and insects there, but why?

LLOYD BARNES

So in our formal assessments, the specialists spend over by a year and a half and they spend time periods and look at different environments. They initially identify the two colonies.
They gave us these very generic no-go areas on our report. Yes, they gave us these very generic circular buffers for which we thought didn't actually reflect where the birds move because in our opinion, as the applicant, the bird doesn't stick to a little 2 kilometre circle. It's not living in a cage.
In the way we understand some, obviously that they follow a lot of the lands that have been ploughed, that eats in a lot of the grasslands. So we went and commissioned another study with Albert to go and specifically sit and watch these birds and see where they move for a period of time. And that's where he gave us. These more oblong Polygon shaped buffers which more accurately represent the geography where the birds move and these areas that have been identified are only for the sun world, others and you can see there's actually more than two that what we're originally site at the bottom, yeah so.
We can't put any turbines within any of those areas and none of the blades. So even the location of the turbine needs to be back by 91 metres because of the blade might go into that on top of on top of this, there will be a curtailment strategy as a part of the wind farm. That's a bird that flies.
In these areas, if it's a sensitive bird like southern bald ibis or Marshall Eagle, the wind turbine will in one way or another, be programmed to switch off either automatically based on the environmental conditions or via camera system, which will pick up that the bird is flying. Luckily, a southern bald arvis is not the smallest bird.
The camera system can pick them up blind and more every single day. We set the technology, gets fits and better and they can identify these birds up to two kilometres away with the camera that will be required for this.

JOSUA MEYER

How long you take? (to shut a turbine down)

Andrew Pearson

45 seconds. That's we are thinking we the two. The things that make 2 mark with Within a a minute, but around 40 seconds.

JOSUA MEYER

But your business, what to say?
About the eyes. Eyesight of the yeah, but no,

LLOYD BARNES

it's not great. Yeah, it's not great. So we was in the same stuff. Yeah. So sometimes we've seen on other existing wind farms that a bird can plug straight into the pylon. And should you guys see them flying into the fence?

JOSUA MEYER

So this one just applying this into Intel, exactly that I'm trying to get rid of one.

LLOYD BARNES

One thing that this EIA process is quite interesting that once if the wind farms are operational and we are doing monitoring every single week to see what birds are falling from the sky and what we're colliding with.
If it's seen that we are killing too many southern bald ibis's, we'll have to change what we are doing and increase our mitigation strategy and that might even mean turning some winds up months off complete in the morning and in the evenings when the bird we know some of the others flies at that time.
But can turn that knife because it's unboltered. There's not flying, so the project still has the ability, and I hope that when the wind farm is built that you hold us

accountable and and help us react to these sort of things.
We try to go with as big as a conservative approach and precautionary as possible, but things happen during operations and we still have to change. Then we have an existing wind farm in the Ark. At the moment it was found that the collisions on a particular eagle were too high and now we've we are going and painting those blades on in that wind farm too.

JOSUA MEYER

Well, not hoping it's informed by the AB formal

LLOYD BARNES

specialists who have advised that this is the way I'm

JOSUA MEYER

I'm scared of specialists.

Andrew Pearson

Yeah, well anyway, so. But so that's a it's just to give more character that it's actually a partnership with the.
So Percy Fitzpatrick Institute of Institute of African Ornithology in

JOSUA MEYER

I've got a big, big problem with with with who? That's James. Yeah. Doctor Jenkins?

Andrew Pearson

It's Arjun, Dr Arjun, Amar and Megan Murgatroyd. So they're working with the with the wind farm. And they've designed a blade patterning experiments.
Experiment. So that's so that's that's still under underway. And there is another experiment that's happening in hopefield at the moment and that is showing very

good results and so.
It's quite promising. It's not, it's not proven 100% and but it is improvement in in in Norway to be quite effective and it's starting to be proven now in South Africa. Let's I think those as well. So you know at Hopefield they're having very good results in the western cape.

JOSUA MEYER

I got a big problem. I got a big problem with all this sitting down and designing. Obviously, flying in order to model this models index experiment.
One Marshall Eagle is signal it. It's not cutting down. It's the upper market. And what this? What was the starting it do you think birds? What was the population before it? Yeah, let's. They're getting this promise on the on the box because it's this honestly. And then yeah. And that's what I want to do, put in music, but on different

JAN ROBERTS

on certain species. You don't have a chance for even adjustment. You're going to kill them out.
Be before you've done any adjustment or even finished your assessment. If there's only 5 eagles you got.
With them out being the theoretical calculations of all those being areas where they they fly if the wind blows in a certain direction with a certain speed that is null and void.
Wind direction and speed is not taken into consideration. That's it. It it it's it's a waste. So that's an interesting aspect.

LLOYD BARNES

So that's an interesting point that you bring up about the the wind conditions because I mean that's.

JAN ROBERTS

We have winds here of 75 kilometres an hour.

In any direction? Yeah, at at at different intervals, unpredicted intervals. Not even the weather report is accurate. Yes. Yeah. So sorry. What was that guy say?

LLOYD BARNES

Yes. Right. No, no, that's that's agreed. And the wind speeds are higher. We've seen them on our MET MASTS.
Part of another curtailment mechanism is to switch off the wind turbines automatically when those particular environments and conditions are met that we know particular birds will be flying,

JAN ROBERTS
or your your prime winds, you're gonna switch off your.
Your turbines, and that's what we will do, because that's when we have the prime wind. So it's gonna make you inefficient. Have you done those calculations?

LLOYD BARNES

Yes, that's what. That's what we mean. Thank you but also.
Uh, no, sorry. That's what I know. What I was gonna say who come back soon.

REBECCA THOMAS

And to a bigger point, which I think Antron was sort of heading to when you asked the question, if you don't have that land signed, then how do you make the project happen? So I think.
And I had a similar discussion with the representatives from the Mpumalanga agencies that we're following a development process. We have projects in, the northern, western and Eastern Cape. We're doing one in KZN. We actually walked away from 2 projects in KZN. We've walked away from sites in Mpumalanga. So we we do processes and.
Follow our development process.
The EIA is is where we're at on this project. We haven't got power line servitude signed up. It would still have to happen before this project is realised. Another aspect we briefly mentioned is financial close.

None.
That's what you'll know better. But I mean, we we're talking amounts of probably what close to 2 billion or something for our projects. The bank also knows you're looking about 33 billion 342 which you need to get the bank.
To loan you and during that loan process due diligence, there's also you know strict lenders requirements they they put their lawyers, they do a legal DD.
We have our shareholders CIP who hold us accountable for IFC World Bank standards. So you know if you're even thinking of taking a project to financial close. You've got a million more hurdles and to go through, we mean, and somebody also attest to this during an FC process, something will still pop up even though you've got, you've got this environmental authorization that says X.
During the IFC process, I can always guarantee you will change something two to five times before it's even nearly accepted or correct. And if you cannot do all those things.
One, I mean, the Bank's not going to sign off and lending the money and you're not going to have a project.
The.
Why are we looking at a wind farm in the malanga? A couple of reasons is.
We're all familiar, I'm sure. And for those who maybe aren't, but I'm sure you've read it in the news. Obviously there's great constrained and Eskom and the power lines and physically can't actually put more renewable energy in the Northern Cape because they haven't upgraded their lines.
A lot of movement towards the eastern side of the country. That's probably a big the biggest reason. The other one is OK, the coal-fired power stations, we know they're going into like a decommissioning phase over the next 5 to 10 years.
That they then get shut down. And what that happened? What happens then is because all the coal-fired power sessions are close to the load, which is obviously counting with most of the power is being utilised by the big industries etcetera.
So as that goes, then there's load centres further away from your other energy producing and then as energy travels through the power lines, you get losses, I suppose, like just like heat would dissipate from like a pie.
Electricity losses. So it's also that there is going to need. There's going to be the need for more actual power generated near the load.
These are all just part of our day-to-day job and the work we do, and by no means you know that's that's what molilo does. We look to address where, where the

energy can be sourced from where, where it can connect to.
And.
This is where we've landed.
We can see by the various reports that we are going through a very complicated process. I think our counterparties are experiencing the same in bomalanga, we would like to think we're following the processes.
I think today's been useful and exactly, I mean we will get back to you on a number of things, but also checking the sun for Ibis and and all of that.
Yeah, but bottom line is, if we cannot make this project work.
Because we cannot sign servitudes or or, the turbines aren't producing enough energy to make it financially viable. It will not happen, so it's even a project that can happen.
If it's, if everything is done correctly and the and the work is put in and the lenders and the wind and we answer everyone's question, but at the end of the day, if the wind's not right, if there's something that the lenders aren't going to, they're going to say there's too much risk.
It's not going to happen and that's our process we're following and.
And part of that process is the EIA, which is your opportunity to.
To say why you think it should not should happen.

Anton Lohse

If I can maybe just add to what Rebecca is saying. So this is only one of the hurdles on has to overcome to be able to develop a project. If you've gone through this process, it still doesn't mean you have a project. There are too many other moving parts to this before you get to the project. And what Rebecca stated is correct. And its maybe just good to know these things. Because these project are so difficult to develop, it doesn't match with any person to actually get that amount of money available. The bank borrows them the money at risk. The bank, because it is borrowed to you at risk, wont give you a cent, if they are of the opinion that there is something with this project that wont work. This can mean, you may need to use a specific turbine which may not work over specific times of the day, because this is what brings the assurance to the bank. The income that you generate out of that turbine, must be paid by the bank. Otherwise they wont allow you to perform this project. They just wont give you money. Another thing of importance, is that we do

have an international investor CPI, whom invest in pension funds money into this project. They also have to approve this project and they have more stringent requirements than some of the banks. So the moment when it look like you are busy with a project where the impacts will be too major and it doesn't make sense to them, they will also not allow you to continue with the project. The fact that you have an EIA is not the final piece, come hell or high water, and this is now where the project starts. This is just one step in the process and one of the hurdles you must overcome to get a project. On the other hand, you must also be able to sell the power. So if you cant produce power sufficiently, or you don't have enough, you also don't have a project. Theres a lot of moving parts to this whole process.

JOSUA MEYER

OK, now I just want to.
OK, I'll.
I just want to know, mulilo, why? Why does it take? Why do we have a meeting today? We're really asked for a meeting in February.
It was the night. It's they not got the root. OK, now the root, the.
Emails I got from.
From my lack of conspiracy concerning birds, I'm not classified to people being on birds.
I just want to know why if we wait so long.
Please come and sit around with table.

REBECCA THOMAS

I'll jump. I mean, I'll jump in with again also my knowledge.
Short answer is we definitely should've make with you earlier. Sorry, only not me.
Also yes, but they make you a young man that. But I was bypassing moment.

JAN ROBERTS

Why? Why meetings were made with me is after Christophe came around and we were put out on on on.
Options we signed and things like it. I started digging into this.

On the added list of things which I didn't know agree, I said. First off, I want feedback on it. It didn't happen. Then GAIL and be honest and.
And came along and then it stored it and I gave them feedback. This like it.
But I've I've I've never received a formal answer on all of those.
Another one, which is a a great concern of mine still is the spread of fire.
The law says the landowner.
Stays responsible for the spread of fire.
Doesn't matter who.
Mozo is on the property. The property owner, even arson. You. You you responsible on on on the spread of that. And I asked in what ways is is that going to be.
Guaranteed. We have an insurance, but it's the Max is limited. Mine is to 11,000,000.
If I increase that, they reduce my cover to my neighbour for my mishaps by 50%. So then it's 5 million.
And I have to pay an excess. We are surrounded on the eastern excalment by forestry. Their claims are massive. Already we have the history of a farmer that it has was sold out.
Due to a forestry claim, they said no. We insured you're under, that means nothing.
I you get you can have an insurance for five rent.
But there's no impact study done on what the contingents can be on.

Anton Lohse

Maybe I can answer, fires are a big problem-

REBECCA THOMAS

So I think Andrew and I was saying it should have happened earlier I.
Was also an e-mail where recently that this e-mail came through and.
I do not have an answer, but it appears this e-mail slipped through the cracks with your request for a meeting, and I've looked at it and I and I'm I sat there going but how? How I can fully understand.
Why, Mr Mayor, is now extremely upset because we have not answered him.
And I can only apologise for that on on behalf of our team. So in that respect, it should not happen,

JOSUA MEYER

but they seem to be there's a general.
Because I approached the bird specialist.
It's ignore.

Anton Lohse

hang on hang on, I wont know if you sent an email to the specialist, the fact of the matter is that this is an independent specialist.

JOSUA MEYER

That's responsible. What he's saying. You're using this word.

Anton Lohse

just to confirm what Rebecca says I want to take it back. landowners, most important participants in the process, because it's a long time term project. The point I want to make is we are here and we try to answer your questions as best as we can. Not Not everyone will agree with each other, but the fact is, the email we did miss and we apologise for that

JOSUA MEYER

The report on the speechless voice listener.
With the report of Canadians of the.
You stay.
Third problem, not invention.

LLOYD BARNES

So his findings,

JOSUA MEYER

I don't know if you want that that's in your report. OK. OK. What what is writing said are, are you looking at reports? Are you paying attention on this and that's that's what's working me.
What will change connect?

Anton Lohse

Yes. We talking past each other. What I want to know is I'm not following nicely now

JOSUA MEYER

Yes. the things that shows towards me, all my consent, not I sent faxes, but I don't know what's the channels. I sent my email to Lucy. We set what as infrastructure
I don't know. That's why I don't know. What is the channel between?
I'll I must work through the future channel, so I see my e-mail using.
And nothing. I asked the reasons. Can you put the?
The communication about the extension of oh, OK. Yeah. And this same happen with recommendations from the social specialist.
So nothing, nothing.

LLOYD BARNES

So how it works with all social specialists is that person who conducted the interview would take your points and issues that you may have raised. Maybe some things are on fire security. That specialist will then make recommendations to the project that they must implement. So if you sat and said this, I'm worried about security and the specialist would make a recommendation and say that the security for the Farm needs to be approved because it had been raised as a social issue.
Actual transcripts and interviews and those sort of things probably don't make it into the public reports because it's a private conversation, but the results would have had mitigation advised for it. So I can tell you for one security was picked up as an issue as this is an isolated area. We're in the farming region historically. we know what happens.

Places where we will access the wind farm or anyone who represents Mulilo will access the wind farm will be access control, so any of the farms which we are going to have turbines on there will be a controlled gates. There will be cameras, there will be sensors. No one will be able to access those farms so much anymore.
There won't be little fences that will be moisturised things such as no, but, but no, I my concerns.

JOSUA MEYER

With all the terms is that not a problem? It's supposed to be this year, yeah.
And that sound? The species also called it down. Sound is not only terribly 400 metres, not it is gross. I've got the same problem now. Redcap this side.
I've done it. They're going to be monitored, they're going to play. Yes, the moment I'm hearing that stuff, they're going to play.

LLOYD BARNES

So I think your particular points of scope we need to go and look at that and get this which is not responsive. I thought we will, we will come back to you with that
Andrew Pearson
I think you are referring to the emails that you've been sending to Lucian, I think you're wanting a direct response to those emails.
Those emails do go into the comments report and during this process there will be responses. But and you also asked, you'd like to see those responses before we submit the final

JOSUA MEYER

You might do that, but some of that.
That emails are a sync integration. It's not that my comments OK that is info that I need that I might OK able to comment. OK that's that's that's that's that's the correspondence that I think

Andrew Pearson

and do you want to have Better responses to those emails?

LLOYD BARNES

If you say Lucian, please send me more detail on that, but please send me a claim. Said that it's known as a comment. It's something that you don't need a comment. Yes, yes.
The response? The yeah. Yeah. So I get to receive Pete ****** asking for the coordinates of this device. Yeah, but but like, the the other one, I don't mention. It's no, it's

LLOYD BARNES

Great. OK. So we will give that to you.
And then the sign that I'm saying what the special is saying.
Yeah, I think they want the last thing that from my side that I want to clear up is the Marshall Eagle, the tagging of the Marshall Eagle.
Was it done with a permit?

REBECCA THOMAS

I think the concern has been raised here. I would like to start on this so.
The.
Yeah. On the the bird was tagged before I actually joined. But I mean, I've been doing developing and prior to developing lives actually wasn't as well. So generally, if you're going to capture and tag a bird it can only read.
Be done by a handful of people who've either done it before. We obviously using endangered wildlife, trust they've been involved in a number of period capturing and research programmes and.
Other permits from different municipalities, so in short, where we access and and I think the point I want to make here is we will.
Finalise all the documentation that needs to to send you. I think also on the sharing of the data, my original being not the person who applied for the permit or not,

nurse or not the authority.
Charge of renegotiation for the permits.
My one and only hesitation initially was.
Making available information on a protected species that I'm which I'm not able to seem familiar what their act says I can and can't do and that's what we wanted to find out. And oddly enough, we're still trying to close out the findings on on that.
There was a permit that was issued prior to the tagging of the bird. We will put all of this together and make sure you have it. I just want to make sure we have everything before so that we're not, we're not going back and forth any more on this NASA.
We would essentially never want to capture a bird illegally we by means of appointing specialists. To do this, we trust we got the right people to do the job.
There was a permit that permits.
There was some issue at the province where either the legislation changed or a new application for a permit had to be done, so there was a second application submitted and it was a permit issued for that.
And there was obviously also endangered Wildlife Trust before, before the Ethics Committee even allows any of their staff that the Ethics Committee will only sign it off if there are permits in half.
As I said, and I think, Mr Mayor, you've done your homework on this matter as well. And we're also just making sure that, you know, we're looking into what we did. Did we do anything wrong if we did, was no means.
The intention at all, and we will come back to you with a formal response on this matter so that it is it is factually presented and then we can take it from there

JOSUA MEYER

is that the permit that you create the last?
Anton Lohse
No, no

REBECCA THOMAS

there is.
There is now another one, and again I'm. I'm I'm frustrated because I'm annoyed to find out the issue we sent you or we that the permits and then there was another one

and I'm like guys.
This is not does not look good. I know it does not look good, so we will close this out for me. And then based on what's on the table, we will have the next discussion.
Yeah.

JOSUA MEYER

Are you comfortable to allow data to be used in your final report if it was?
If he was no permit.
Are you comfortable to use the data? Use the data in the final report.
You presented.
In your final, if the legislation says you need a permanent if it was no, if it was no.
No, no further.
Earth.
If that, that's the only question.
Cortana, I've I've had a huge problem with this this bird special this weekend.
That's why I don't want to recall.

Lucien Barbeau

Mr Mayor, I will okay can I put it in the formal response to you that answer?

JOSUA MEYER

Yeah. No, you don't have to. You have to sort it out yourself. If it is not valid.
Can that data be used in? There will be a question that is asked to ERM, yeah, yes.
And would need to. And I would not see what I would not see that permanence.
Yes, I also got two permits. Yeah, we'll see the onion. I I think he works on any from.
Yeah, I think onion. No. Yeah. Doctor Tate is in the two permits. So if.
If there's another thing.
Then I then I know discussed what happened here.

REBECCA THOMAS

There's two permits from the Doctor, Tate. And then there's WT index committee. Signal. Well, I'm sorry. Yeah. So that might consist of LG.
See. Thank you too one time.
I know you get it, but not just why we mostly you didn't. Yeah. And have it's when it's the winter and it's about you have. I'm safe.
But it's not. Yeah, I think that I see Roy. I think Roger might see that there's no.
INAUDIBLE
If I say it then.
No, this one.
You're comfortable because I pick them up on this day.
Sorry, what do we do to?
Where you from? OK. So these are all the point they just said. This is no. What I mean is this.
No, but we just we basically.
We have to hear what what source of the information we need.
With other jobs and information. Yeah. Yeah, that's a data that maybe we're going to have to.

JOSUA MEYER

That's for the female.
Yes, I'm not going to need you to because I think there's another one they had perfected this group.
You don't. I'm not going to need to start. Like I said, I'm not yet screw somebody.
Not yet. It's true. We're like, OK, take out something.
But there's something wrong in.
It's a one sandwich.
Any more, the one that you play that that what takes this for you can write list of takes it's ready to dependency.

Rebecca Thomas

OK so.
These are the two. It's the one that's the pictures really interesting site. That's what we've been. This boss. That always or just none. OK.
When we was, yeah. To the east, yeah.
You're the non, yeah.

Lloyd Barnes

Yeah. Then I'll use it as a perch.

JOSUA MEYER

And so she's a lot of activity. I think there's another juvenile there. I think she's given birth to another. Yeah, the juvenile philosophy that. And I think there's now my.
I saw that he was mistaking, so I think they put a breathing in another one. What happened? They got shot.
Yeah, it's the as it is. Good. Yeah, but discovered it's not like it should be recorded and the same up. And you have the the monitor of the birds that we killed at the the third one. The existing balls are got evidence.
If I.
I I I guess the acting on. Yeah that's that's that's that's that's.
You.

REBECCA THOMAS

I have to sit across the table and tell you we're doing things as responsibly. You know, we believe we're following the law. We believe we're doing things responsibly. We're looking at programmes, we're we're tracking an eagle knot because we want to do.
Yeah, it's the same that. Yeah. And I got the response of the report of.
And.
Yeah. So I think we need to, if we raise this and internally and it will be and someone can say between you and me, there will be a formal assignment. Yeah, it can be seen

practical statement and I can track the.
But I I don't know I suppose to yeah.

JOSUA MEYER

Yeah, as I say, are you willing to use it now?
You're comfortable to use that data in the appointment report or the models that's been created by them now.

Lucien Barbeau

Mr Mayor, I'll I'll whom it responds to you. Something you must vote to. I've written down your E question.

JOSUA MEYER

Maybe you'll be a lawyer, but the emails. But I must speak, speak to my lawyer. That's why. Yeah, I don't want to speak to lawyers. That's why my lawyer is not. And I think I don't want to go too far
I I tried to go in. I've told this to frustrate this. Welcome please. If it seems that area. This holds scope.

REBECCA THOMAS

Our reports are are quite clear and and attest to that as well. I think

JOSUA MEYER

I say say nothing with other people. Any definition? Yeah. Well, just to see.

JAN ROBERTS

I stole me the on the fire side of it. It's a world problem. At this stage. I mean, it's in Europe, it's in Canada.
We suffer every season fighting fires, arson and actually above that is eskim lines,

throwing spots due to shortages.
And any extension in electricity supply is increasing that risk to us.
And nobody, nobody assists. It's the farmers on their own. Even the FBI. We got the Fire Chief we got here. He's sort of against us.
He doesn't do his work. We sit amongst a lot of government owned farms that were just people saying there's no firefighting equipment. They take the grass alike when they want green grass for the animals.
And they just leave when it's they said it right, they leave it because they know we're going to stop it and we stop it to try and protect our property.

Anton Lohse

Okay.. It's not a project. A fire is just as big risk for energy project as it's on the ground You're not gonna get finance from the bank if there's not like rules that means if a fire exists from a neighbouring firm, it can come from both ways. You're not going to get insurance from the bank if there's no rules to protect against fire. and that includes insurance. The moment you look at at land owners on r grounds, the fire is, then you must have extra rules. If he causes the fire, he has to have the insurance to pay. I don't know if that answered the question.

JAN ROBERTS

There's. It's not a return on paper and there's there's there's no confirmation. I have to have the insurance, but the day, when it happens, then they're gonna point fingers. It's that one and that one. I understand. We are all involved in the fire. the guys that's not gonna agree the guys that's gonna get benefit out of it.

Anton Lohse

Just as you are a neighbour neighbouring landowner don't want the fire to come to to your property, so you also don't want it to come to your property. Then the ground owners will come together to make sure that there's a combined It's your tower. It's your insurance. It first comes to the landowner where the fire is. For instance, if a development happens on your your property, they will come to you to

say the project guys will tell you how you have to to put rules how to prevent the fire. You as the the guy that rents.

JAN ROBERTS

There's two phases when you set it up and then there's the phase where you operate. When it's going to Escom and then Scom starts, there's There's no formal contract between the landowner and the project where no fire happens., there must be like a formal agreement I can't run a project for the project to work, there must be all theurances in place.

Subject: Comments on the draft EIA report for Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province - NWJ Vorster Trust

You don't often get email from vorsterboerdery@lantic.net. Learn why this is important
EXTERNAL MESSAGE

The NWJ Vorster Trust is thankfully not part of the proposed WEF anymore.
We will still be affected by the wind farm if it becomes a reality.
Therefore we want to raise our strongest concern against it.

1. All the turbines, on the edge of the escarpment, will permanently scar the scenery and is unacceptable.
2. We are very concerned about proposed turbines 40, 44, 45 and 46 because of the noise and most probably shadow flickering.
3. The same applies for turbines 51, 52 and 53.
4. Turbines 40, 41,42,43,44,45,46, 51 and 52 will cause visual pollution which is unacceptable.
5. Proposed turbines 40,043 and 44 are too close to the breeding site of the secretary bird. A safe no-go zone of at least 2,5km should be implemented around the nest. The two secretary birds stay in the area south east of this location and provision should be made to secure its foddering habit.
6. A Marial Eagle pair were spotted several times in the past at Farm Klipfontein. It is of great concern because the always fly off in a north east direction where most of the turbines will be located.
7. The southern bald ibis are also present in great numbers on the farm Klipfontein especially when cultivating land or harvesting. Provision should be made for a safe flying zone to their roosting site on neighbouring farm Windhoek where four turbines will be located.

Regards,

Pikkie Vorster – Director at Retsrov Boerdery

You don't often get email from vorsterboerdery@lantic.net. Learn why this is important
EXTERNAL MESSAGE

The NWJ Vorster Trust is thankfully not part of the proposed WEF anymore.
We will still be affected by the wind farm if it becomes a reality.
Therefore we want to raise our strongest concern against it.

1. All the turbines, on the edge of the escarpment, will permanently scar the scenery and is unacceptable.
2. We are very concerned about proposed turbines 40, 44, 45 and 46 because of the noise and most probably shadow flickering.
3. The same applies for turbines 51, 52 and 53.
4. Turbines 40, 41,42,43,44,45,46, 51 and 52 will cause visual pollution which is unacceptable.
5. Proposed turbines 40,043 and 44 are too close to the breeding site of the secretary bird. A safe no-go zone of at least 2,5km should be implemented around the nest. The two secretary birds stay in the area south east of this location and provision should be made to secure its foddering habit.
6. A Marial Eagle pair were spotted several times in the past at Farm Klipfontein. It is of great concern because the always fly off in a north east direction where most of the turbines will be located.
7. The southern bald ibis are also present in great numbers on the farm Klipfontein especially when cultivating land or harvesting. Provision should be made for a safe flying zone to their roosting site on neighbouring farm Windhoek where four turbines will be located.

Regards,

Pikkie Vorster – Director at Retsrov Boerdery

Good day Mr Vorster,

Thank you for your comments regarding the proposed Sheepmoor and Emvelo WEFs, and for your patience while we prepared responses to your comments.

Please find attached a document containing our responses to each of your comments. We would like to assure you that your comments and the corresponding responses will be incorporated into the Final Comments and Responses Report, which forms part of the EIA Process.

Should you have any further questions or require clarification on any of the points, please feel free to reach out.

Kind Regards,

ERM

Regards,

Pikkie Vorster – Director at Retsrov Boerdery

The NWJ Vorster Trust is thankfully not part of the proposed WEF anymore.

We will still be affected by the wind farm if it becomes a reality.

Therefore we want to raise our strongest concern against it.

1. All the turbines, on the edge of the escarpment, will permanently scar the scenery and is unacceptable.

Visual impacts have been assessed by a qualified visual specialist. While the introduction of turbines will alter the landscape, the placement and design have been guided by specialist input to reduce visual intrusion where possible by avoiding the placement of WTGs in areas advised by the specialist. The concern regarding the scenic value of the escarpment has been recorded and will form part of the decision-making record. The proposed WEF has a life time of between 20 and 25 years. The facility will therefore not exist permanently.

2. We are very concerned about proposed turbines 40, 44, 45 and 46 because of the noise and most probably shadow flickering.

Noise and shadow flicker impacts have been assessed through specialist studies. Turbine placement and mitigation measures will be implemented to ensure compliance with acceptable thresholds. Should post-construction monitoring identify exceedances, further mitigation will be required.

3. The same applies for turbines 51, 52 and 53.

Answered above

4. Turbines 40, 41,42,43,44,45,46, 51 and 52 will cause visual pollution which is unacceptable.

As noted, visual impacts have been assessed by the visual specialist, with turbine locations refined to reduce exposure from key viewpoints. Your objection to the visual impact of these turbines has been recorded.

5. Proposed turbines 40,043 and 44 are too close to the breeding site of the secretary bird. A safe no-go zone of at least 2,5km should be implemented around the nest. The two secretary birds stay in the area south east of this location and provision should be made to secure its foddering habit.

The avifaunal specialist has surveyed known Secretary bird nesting and foraging areas in the study area. Turbine placement has considered these areas, and appropriate buffer zones are being implemented. Your request for a 2.5 km no-go zone will be shared with the avifaunal specialist for consideration in the final mitigation recommendations. In order to accommodate for avifaunal species who inhabit the area following the completion pre-construction avifaunal monitoring, all wind turbines will contain patterning and all wind turbines will be subjected to Shut-down on demand. Shut-down on demand for Species such as a Secretary bird are especially impactful given the species size and ability to identify the species easily when flying.

6. A Marial Eagle pair were spotted several times in the past at Farm Klipfontein. It is of great concern because the always fly off in a north east direction where most of the turbines will be located.

Martial eagle observations have been incorporated into the avifaunal assessment. Turbine layout refinements have been made to reduce potential collision risk, and mitigation measures, including operational curtailment where necessary, are being considered. Mitigation measures, specific to Martial Eagle have been incorporated into the Final EMPr. These management measures are informed by robust data and scientific research. Additionally, the applicant has welcomed the blanket implementation of blade patterning and Shut-down on Demand.

7. The southern bald ibis are also present in great numbers on the farm Klipfontein especially when cultivating land or harvesting. Provision should be made for a safe flying zone to their roosting site on neighbouring farm Windhoek where four turbines will be located.

Southern Bald Ibis roosting and foraging behavior has been a key focus of the avifaunal specialist study. The avoidance areas (for Southern Bald Ibis) was informed by the focal point monitoring of the bird species over a dedicated period of time, to understand where the species forages and how they interact with the receiving environment. Turbine placement has been adjusted to avoid high-use flight paths. Mitigation measures, such as Shut-down on demand and blade patterning, are under consideration.

Hi Jamie,

I hope this message finds you well.

As part of the current Comments and Responses process, a number of specific WTGs have been called out by both departments and I&APs. Lloyd has taken the liberty of compiling a list of all such turbines and providing descriptions of the actual ground-truthed environmental conditions at each location.

We kindly request that you review these descriptions and provide your agreement and sign-off on their accuracy. Your confirmation is essential, as this information will also need to be shared with the specialist responsible for the Biodiversity Offset Report.

Given the tight timelines, we would greatly appreciate a very quick turnaround on this request. For your reference, we have attached the relevant I&AP comments alongside Lloyd's list.

Please let me know if you require any additional information to complete this review.

Regards

EXTERNAL MESSAGE

Hi Lucien I will take a look and get responses to you.

You had let us know about the responses so had kept a window this week.

I'll get them to you as soon as I can, I will just need to taka a look and may need to give some thought for a day or two or do some further analysis depending on what they are.

I note the timeline and will try get to you by end Wednesday or sooner if they are not too comlplex.

Regards
Jamie

EXTERNAL MESSAGE

Hi Lucien, here are the reports with the revised layouts replaced where applicable (the last few maps in the reports).

There is an overlap with the Emvelo/Sheepmoor boundary that was provided where a central area fall within both sites. I have not had time to figure out what's going on there or to scrutinise the layout to check if there are any changes that affect the outcome of the assessment.

Dear Specialist,

I trust you are well.

Please find attached the final layout for the proposed Amsterdam WEF as received from the applicant. Kindly update your respective specialist reports to reflect this final layout, and to submit your revised reports by Monday, 12 August 2025.

If, for any reason, you anticipate that you will not be able to meet this deadline, please inform me as soon as possible so that we can explore alternative arrangements.

Thank you for your continued support and contributions to the project. Should you have any questions or require any additional information, please don't hesitate to reach out.

Kind regards,

15 August 2025

Dear Stephanie,

RE: COMMENTS ON THE ENVIRONMENTAL IMPACT ASSESSMENT PROCESS FOR THE PROPOSED EMVELO WIND ENERGY FACILITY AND SHEEPMOOR WIND ENERGY FACILITY [DFFE REFERENCE NUMBERS: 14/12/16/3/3/2/2611 & 14/12/16/3/3/2/2613]

1. INTRODUCTION

1.1. This document contains comments on the Environmental Impact Reports ("DEIRs") and associated Annexures for the proposed Emvelo and Sheepmoor Wind Energy Facilities ("WEFs") which were made available to interested and affected parties ("I&APs") during July 2025.

1.2. These comments are submitted on behalf of Mr. Josua Meyer a registered I&AP and owner of Portions 3, 4, 12 and 14 of the Farm Waaihoek No. 286, as well as Portions 4, 5 and 6 of the Farm Onverwacht No. 287, and Portion 7 of the Farm Windhoek No. 291.

1.3. Comments on the first version of the Draft EIA Report (March 2025) were provided within the commenting period timeframe of 30 days (i.e. by 10 April 2025) and covered both the proposed Emvelo and the Sheepmoor WEFs in a single report. ERM have released a second draft of the EIA Report dated July 2025 and the commenting period closes on 15 August 2025. The comments herein are supplementary to those made on the initial Draft EIA Reports of March 2025 and are not to be taken as substituting those earlier comments.

Unit 126, Victoria Junction
57 Prestwich Street
De Waterkant 8001
Cape Town
[redacted]
E: richard@summersinc.co.za

Director: Richard W. Summers Reg No: 2017/536164/21

PO Box 1251, Sedgefield, 6573, South Africa
[redacted]
Email: mjm@megateam.co.za
Web: www.megateam.co.za

Reg No. 1999/069163/23
Vat No. 412 0186921

1.4. It must be noted that the comments, recorded herein, are based on a review of select items using examples primarily from the Sheepmoor Draft EIA Report and associated documents, but apply equally to the proposed Emvelo WEF. This is because the same approach has been adopted by ERM for both projects.

2. FLAWED PUBLIC PARTICIPATION PROCESS (PPP)

User unfriendly documentation places an undue burden placed on I&APs

2.1. As noted in our comments of April 2025, an undue burden is placed on I&APs in the context of being forced to comment simultaneously on the EIA documents related to these two proposed WEFs. This situation has not changed in relation to the current commenting period. Yet again, an undue an unreasonable burden is placed on I&APs to comment on two Draft EIA Reports for two separate applications for the projects located adjacent to each other and proposed by the same Applicant. The commenting periods run concurrently which effectively reduces the opportunity for meaningful public participation.

2.2. In fact, as is noted elsewhere in these comments, the sites of the proposed WEFs have changed, such that they overlap to some extent. This points to the fact that separating these applications is a ruse and that it is unjustified and unreasonable to treat these as two separate applications. It serves no logical impact management purpose and simply places an undue and undesirable burden on the EIA system – I&APs, the commenting authorities and the Competent Authority.

2.3. Also noted in our comments of April 2025, the PPP reports for the respective proposed WEFs are difficult to follow. This situation persists with the current reports– no discernible effort by the EAP has been made to make these documents more user-friendly in this 'second version' of the Draft EIA Report.

2.4. There is extensive duplication of the same correspondence, which makes it an arduous exercise to track the sequence of different activities undertaken and also the issues raised by I&APs (Appendix 6 of the PPP report). Some correspondence is repeated more than 10 times. It also makes it exceedingly difficult to find the original comments made by an I&AP. This adds to the unfair burden on I&APs and reduces the opportunity for meaningful public participation.

2.5. In certain instances, one cannot read the original comments in their entirety (i.e. read the full letter or email from submitted by an I&AP) as the original communication is not provided. Thus, in these cases comments are only available in a disjointed point-by-point fashion in a tabular format (i.e. Section 7 – Comments and Responses Report in Volume III - PPP Report), hereafter referred to as the CRR. This adds to the unfair burden on I&APs and reduces the opportunity for meaningful public participation.

2.6. The burden placed on I&APs is exacerbated by the fact that the EAP has not clearly indicated or described what has changed, such as which specialist reports have been revised or which sections of the Draft EIA Reports have been updated. In addition, the documents themselves

do not show where changes have been made through use of underlining or a different colour text. This means I&APs are faced with having to compare the two draft reports (version 1 with version 2) to ascertain what changes have been made. Clearly this is wholly unreasonable and constitutes unfair process.

DFFE requirements in respect of PPP not met

2.7. The requirement by the DFFE which were communicated to the EAP regarding inclusion of original comments have not been met (see Sheepmoor PPP Report, Section 7 - CRR, page 47).

2.8. DFFE stated that: "Copies of the original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity, must be submitted with the Final EIAr." If these comments are required for the Final EIR Report, then it follows that must also be available in the Draft EIA Reports. Examples of missing original comments are:

2.8.1. Most notably, the **original comments on the first version of the Draft EIA Report** (dated March 2025) from DARDLEA and MTPA **are not provided** in the CRR, which forms part of the suite of documents that make up the July 2025 Draft EIA Report. These comments were submitted on 10 April 2025 (as per the CRR), but the original submissions are not included in the PPP Reports. This is the case for both Emvelo and Sheepmoor. This has been fact-checked through searching for DARDLEA, 10 April 2025, April 2025 as well as scrolling through Appendix 6 of the CRR. The EAP is requested to explain this material omission.

2.8.2. The comments submitted by Richard Summers Inc. and MEGA on the March 2025 Draft EIA Reports are ignored and not included. Email communication dated 10 April 2025 from Richard Summers Inc to ERM confirming that comments had been submitted is included in Appendix 6 of the CRR (see pages 371 and 372 Emvelo CRR and pages 377-379 Sheepmoor CRR). Several searches of both CRRs have been conducted, using various search terms as well as scrolling slowly through the respective documents. **The comments are nowhere to be found**. The EAP is requested to explain this material omission.

2.9. The DFFE also required the following: "All issues raised and comments received during the circulation of the SR and draft EIAr from registered Interested and Affected Parties (I&APs) and organs of state, as listed in your I&APs Database, and others which have jurisdiction in respect of the proposed activity must be adequately addressed and included in the final EIAr" (see Sheepmoor PPP Report, Section 7 - CRR, page 46). This also has not been achieved:

2.9.1. The aforementioned comments from Richard Summers Inc are not recorded in the CRR tables in either of the CRR reports (See Section 7). This means they have been completely ignored.

2.9.2. The comments of 15 April 2025 from Mr Joshua Meyer are not included in the CRR tables in either of the CRR reports (See Section 7). Since this communication involved follow-up

on previous comments to which Mr Meyer had not received an adequate response, these comments ought to have been included. The relevant correspondence can be found on page 369 of Appendix 6 Emvelo CRR and page 375 of Appendix 6 Sheepmoor CRR.

2.9.3. Two landowners, of which at least one is a neighbour, requested inclusion as an I&AP. These requests were submitted on 9 April 2025 (Mr Braam Moodie) and 4 April 2025 (Restov Boerdery). Neither of these I&APs were afforded a fair opportunity to comment on the Draft EIA Report – they were simply provided with a link to the EIA documentation. There is no evidence of any effort by the EAP to afford them a meaningful opportunity to comment or to assist them in familiarising themselves with the proposed projects and associated EIA process.

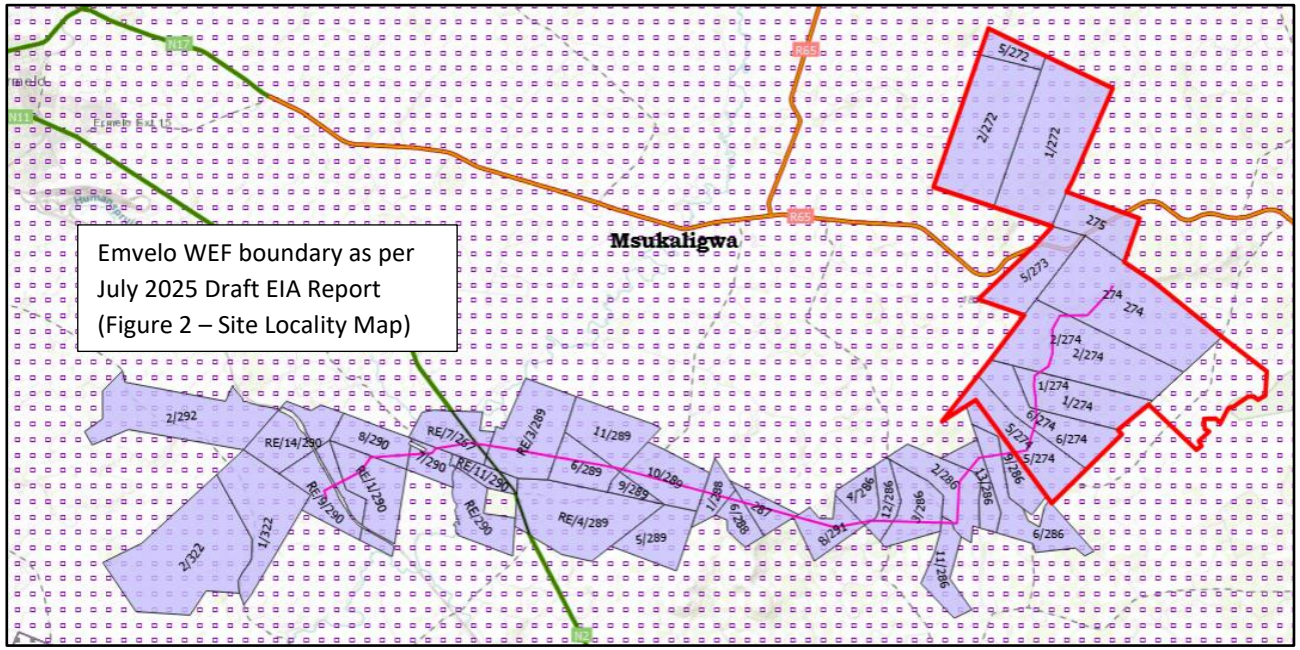
2.10. Whilst one of the uses of the CRR by I&APs is the ability to cross-reference a response from the EAP to the relevant section in the Draft EIA Report to see whether the I&AP's input was actually addressed (i.e. a change is discernible in the report) – this is of no use if an I&AP's comments are not recorded in the CRR first place. This is relevant because not all comments are recorded in the CRR. It therefore follows that these comments have not been considered at all.

3. INFORMATION PROVISION AND PRESENTATION

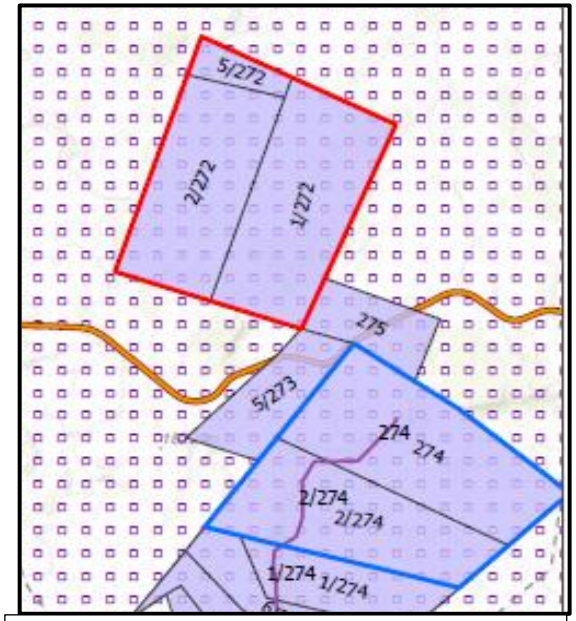
Confusing, unclear and poor-quality information

3.1. The site boundaries shown in the second version of the Draft EIR Report (dated July 2025) differs for both sites relative to the Draft EIA Report issued in March 2025. This is confusing and casts doubt on the accuracy of the information in the reports:

3.1.1. Portions 1, 6 and 5 of Farm 274, Farm Schiedamre are shown in the list of affected farm properties for both Sheepmoor (See Table 0.2) and Emvelo (See Table 0-2).

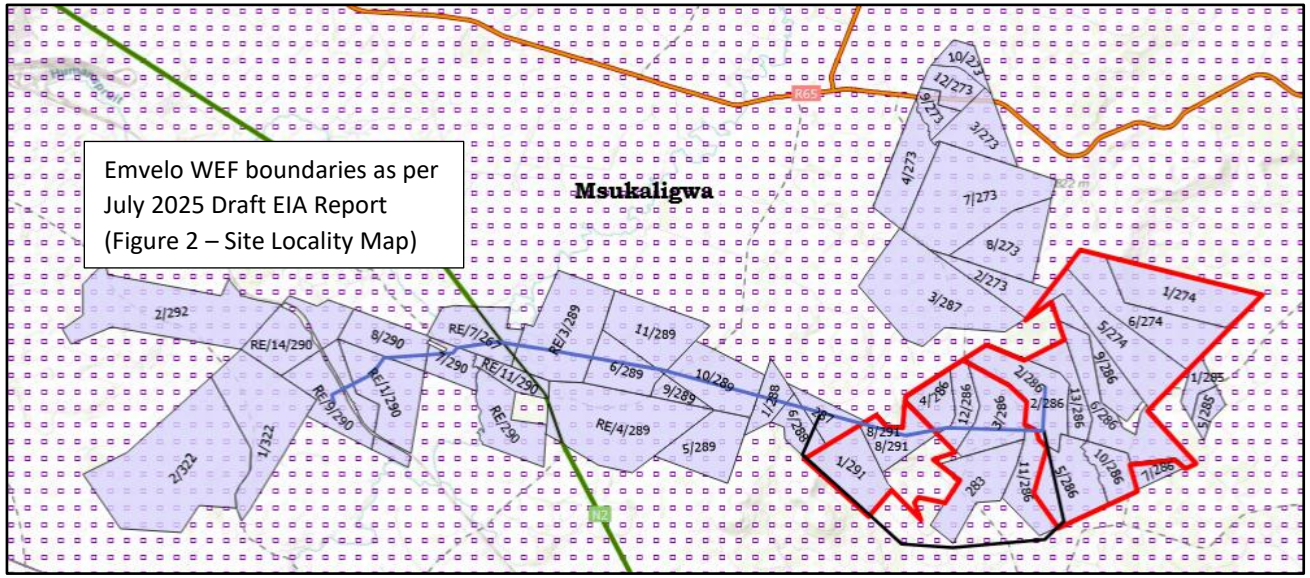


3.1.2. Further to the above, this is the case in both versions of the Draft EIA Reports, that is the March 2025 (Version 1) and July 2025 (Version 2), but the maps and diagrams in the March 2025 Draft EIA Report show a site boundary that does not include the aforementioned properties. This means that tabulated information (Table 0-2) in which affected farm properties are recorded for the proposed Emvelo WEF and the site boundary shown in diagrams and maps are different.

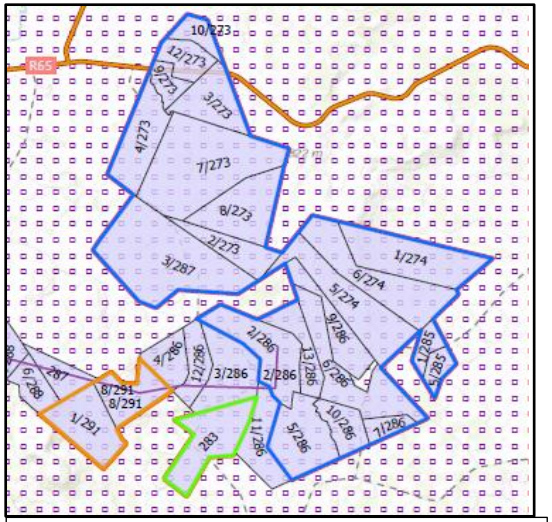


3.1.3. In addition, the site boundary for the proposed Sheepmoor WEF differs in the July 2025 Draft EIA Report, relative to that shown in the earlier version of March 2025. No explanation for the change is given. To add to the confusion, this change is not reflected in all of the maps / diagrams in the July 2025 Draft EIA Report. All of the figures in Section 6: Description of the Baseline Environment in the July 2025 Draft EIA Report show the old site boundary (i.e. as per the March 2025 Draft EIA Report).

3.1.4. The positions of WTGs on the overlapping farm portions (Portions 1, 6 and 5 of Farm 274,



Farm Schiedamre) is unclear. Neither a written description nor a combined diagram showing WTG positions associated with the respective projects on these parcels of land is provided and the project information is materially deficient.



3.2. The evidence for the situation described above is shown in the following diagrams and tables. Boundary coordinates are listed in the tables, which show that no changes have been made to this list of boundary coordinates (the example is taken from the Sheepmoor Draft EIA Reports) provided in the March 2025 versus the July 2025 reports.

Emvelo WEF boundary as per March 2025 Draft EIA Report (Figure 2 – Site Locality Map)

Sheepmoor WEF boundary as per March 2025 Draft EIA Report (Figure 2 – Site Locality Map

WEF boundary positions as given in Draft EIA Report dated July 2025 (Version 2)

3.3. The result of the situation as described in the foregoing points is that it is wholly unclear to I&APs as to what properties are affected by the proposed WEFs, what the extent of the respective proposed WEF sites actually is, how the two sites overlap in terms of infrastructure, WTGs and environmental constraints or sensitivities. Information which is materially deficient and reporting that is in such a state of disarray is not acceptable at the stage of a Draft EIA Report, which needs to be submitted as a Final EIA Report to the Competent Authority on 25 August 2025. It will not be possible to rectify these material omissions in that timeframe and any Final EIA Report submitted to the Competent Authority on this basis will be materially deficient.

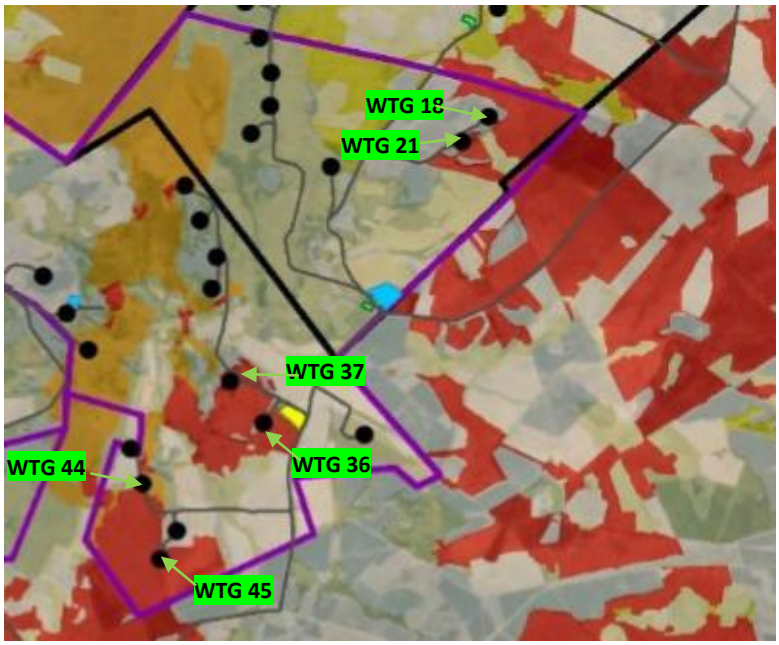
3.4. Based on responses from the EAP in the CRR, it appears the some of the WTGs may have been relocated / moved. These site layout changes are not detailed and the rationale for any such changes is not given in the project description. In fact, the Draft EIA Report is silent on the manner in which the layout has changed and the rationale behind these changes and which were made in response to environmental constraints or sensitivities. Such details and related information are central to determining if a concerted and authentic effort has been made to avoid adverse impacts, in accordance with the precautionary principle and the mitigation hierarchy.

3.5. Coordinates of the WTGs are not provided, and therefore reliance has to be placed on the figures (diagrams), to ascertain where the turbines and other infrastructure is located relative to environmental sensitivities. This makes it confusing for I&APs to appreciate if the impact assessment is informed by credible data. This is exacerbated by the fact that the figures provided by ERM in the March 2025 Draft EIA Report did not have labels on the WTGs because the WTGs are not numbered. This makes it exceedingly difficult for I&APs and the Competent Authority to correlate these figures with those in the July 2025 Draft EIA Report. The lack of WTG coordinate information undermines the ability of I&APs and the Competent Authority to establish whether the position of WTGs has changed in response to concerns about environmental sensitivities.

3.6. Given the foregoing concerns regarding the adequacy and accuracy of information relied on by the EAP and provided in the reports, no reliance can be placed on any statements about WTGs having been relocated / moved in response to noise, biodiversity sensitivities, cultural / heritage resource sensitivities and the like because spatial data shown on maps is confusing, boundaries have changed, the two sites overlap and diagrams and maps in reports have not been updated accordingly.

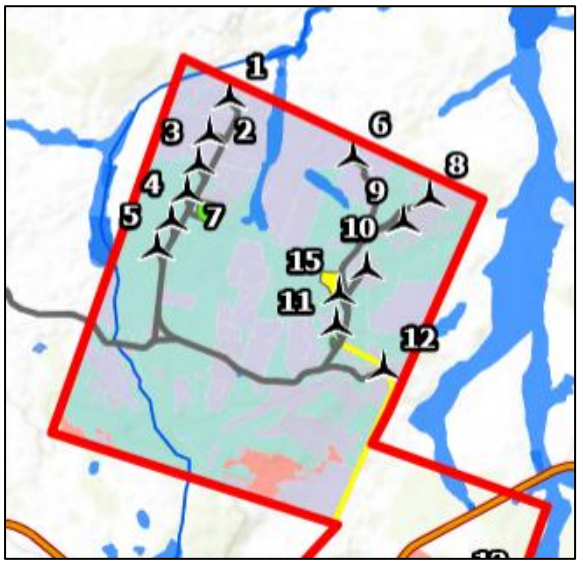
Assurances given in the CRR have no substance

3.7. In the CRR the EAP has offered assurances to concerned parties that WTGs have been moved / relocated away from sensitive areas. Unfortunately, there are instances where this contention is not borne out by the facts and data contained in the reports. Therefore it must be concluded that these assertions by the EAP must be treated with extreme caution by the Competent Authority.

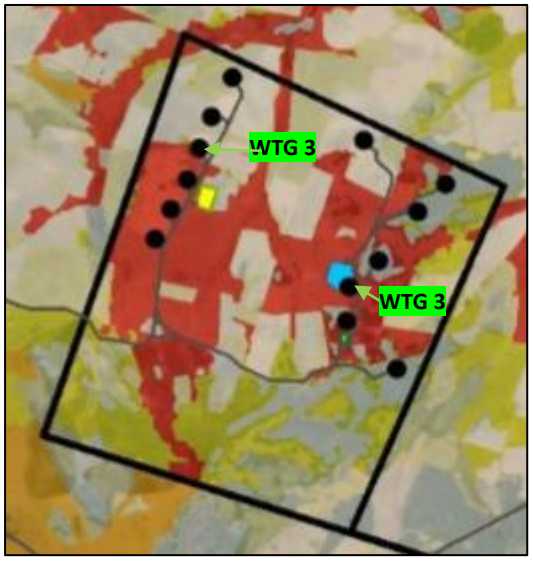


3.8. A specific example is the concern raised by DARDLEA about the location of WTGs in CBA: Irreplaceable areas, with specific mention of Turbine 45. In response the EAP has stated that

this turbine has been "relocated approximately 330 metres southward to ensure complete avoidance of the CBA: Irreplaceable area". Since the Figure 6 – Important Ecological Areas in the Draft EIA Report shows CBAs as a single entity (i.e. does not differentiate according to the CBA: Irreplaceable and CBA: Optimal categories as per the Mpumalanga Biodiversity Sector Plan (MBSP), it is difficult to verify this claim. The information is materially deficient and the Competent Authority, and I&APs are unable to determine – from the reports made available - if the claims made by the EAP are valid. There is too much uncertainty.



3.9. Accordingly, we considered the diagram on Biodiversity Offset Report prepared by WSP. This shows the CBA: Irreplaceable in accordance with the MBSP. It can be seen that in the case of the proposed Sheepmoor WEF, a number of WTGs fall within or right on the edge of CBA: Irreplaceable. WTG 45 remains located in CBA: Irreplaceable, despite the EAP's contention that it has been moved to completely avoid CBA: Irreplaceable.



3.10. The contradiction in the documentation is deeply concerning because it misrepresents the correct factual position on the ground. Furthermore, even if it was moved southwards as stated by the EAP, this would not resolve the situation, since CBA: Irreplaceable is present to the south of this turbine.

3.11. What is notable in the case of Sheepmoor is that there are other WTGs sited within CBA: Irreplaceable or on the edge thereof, besides WTG 45: Irreplaceable, namely WTGs 44, 36, 37, 21 and 18. A similar situation exists for Emvelo as can be seen from the WSP Biodiversity Offset Report – Figure 3-1.

WTGs located in CBA: Irreplaceable – Sheepmoor (extract from Figure 3-1 of the WSP Biodiversity Offset Report). According to the key associated with this diagram, red shading shows CBA: Irreplaceable.

3.12. The EAP states "the turbine and infrastructure layout has been revised in accordance with specialist recommendations, with a strong emphasis on avoidance of ecologically sensitive areas. All no-go areas identified by biodiversity specialists have been fully excluded from the final layout." (e.g. Sheepmoor CRR, page 24).

3.13. Concern was raised about WTG 15 being located in a Key Biodiversity Area (KBA) that is untransformed (page 15 Emvelo CRR). In reply the EAP states that WTG 15 was removed from the final layout. This is not the case! Examination of the extract from Figure 6 – Important Ecological Areas (from the figures volume attached to the July 2025 Draft EIA Report) shows that both WTG 3 and WTG 15 remain located in a CBA (green shading), albeit in a different position relative to the March 2025 Draft EIA Report. A construction camp is located next to the WTG and is also shown situated in a CBA. What is the explanation for this? Therefore, the relocation of WTG 15 does not seem to have offered any advantage from an avoidance of an adverse impact on biodiversity perspective. The lower image is extracted from the Biodiversity Offsets Report and it can be seen that both WTG 3 and WTG 15 are situated within CBA: Irreplaceable. Again, it appears that this is mere tick-box exercise by the EAP with no real intent to report accurately.

3.14. The status of the layouts that have been assessed by the EAP is unclear. Terminology is used loosely as shown in the examples below, taken from the July 2025 Draft EIA Report for the proposed Emvelo WEF. The same text is evident in the Draft EIA Report for the proposed Sheepmoor WEF, albeit that the page numbers are different. Examples include:

3.14.1. Page 9 of the Emvelo July 2025 Draft EIA Report under the topic Terrestrial Biodiversity, it is stated that "It is recommended that a final site walkdown be undertaken in order to inform the final layout design and inform micro-siting of footprints."

3.14.2. Yet the project description also references final layout design as not being finalised (page 2): "The proposed turbine footprints and associated facility infrastructure will cover an area of up to 185 ha after rehabilitation, depending on final layout design."

3.14.3. Then on page 13 on the topic of fauna, the following statement is made: "Final layouts of turbine placement, access roads, OHPLs, and other associated developments were provided by ERM on 30 January 2025. The final layout plans indicate that several wind turbines and access roads fall within areas of high faunal sensitivity" .

3.14.4. Page 28: "Prior to the submission of the final layout plan to the DFFE for approval….."

3.15. It is unclear as to what the final layout constitutes because as already noted, in the CRR the EAP makes reference to WTGs being moved in the "final layout". The reports are plagued with inaccuracies and contradictory statements. The credibility of the assessment process is doubtful as so many uncertainties prevail. IN this regard, the following questions arise:

3.15.1. If as noted by the terrestrial biodiversity specialist (for example), final layout plans were provided by ERM in January 2025, then is this the layout that was assessed for the purposes of the March 2025 Draft EIA Report? This is not clear at all from the reports made available to I&APs.

3.15.2. If concerns were raised by I&APs, specifically commenting authorities, about the layout plan presented in the March 2025 Draft EIA Report, and the EAP's response is that this has been resolved in the final layout, then which final layout is this? This is not clear at all from the reports made available to I&APs.

3.15.3. More importantly, why is there a disparity between the EAP's claim that WTGs and infrastructure has been moved / relocated (and thus, according to the EAP, the concerns about environmental sensitivities have been addressed). This is NOT the case. The figures presented in the July 2025 Draft EIA Report, which show definitively that this is not the case, with one or two exceptions (WTG 7 was moved due to the sensitivity of bird species 23).

3.15.4. Why is there reference to the need to do a walkover to develop a final layout and inform micro-siting of turbines and infrastructure, whereas the CRR creates the impression that micrositing has already been done?

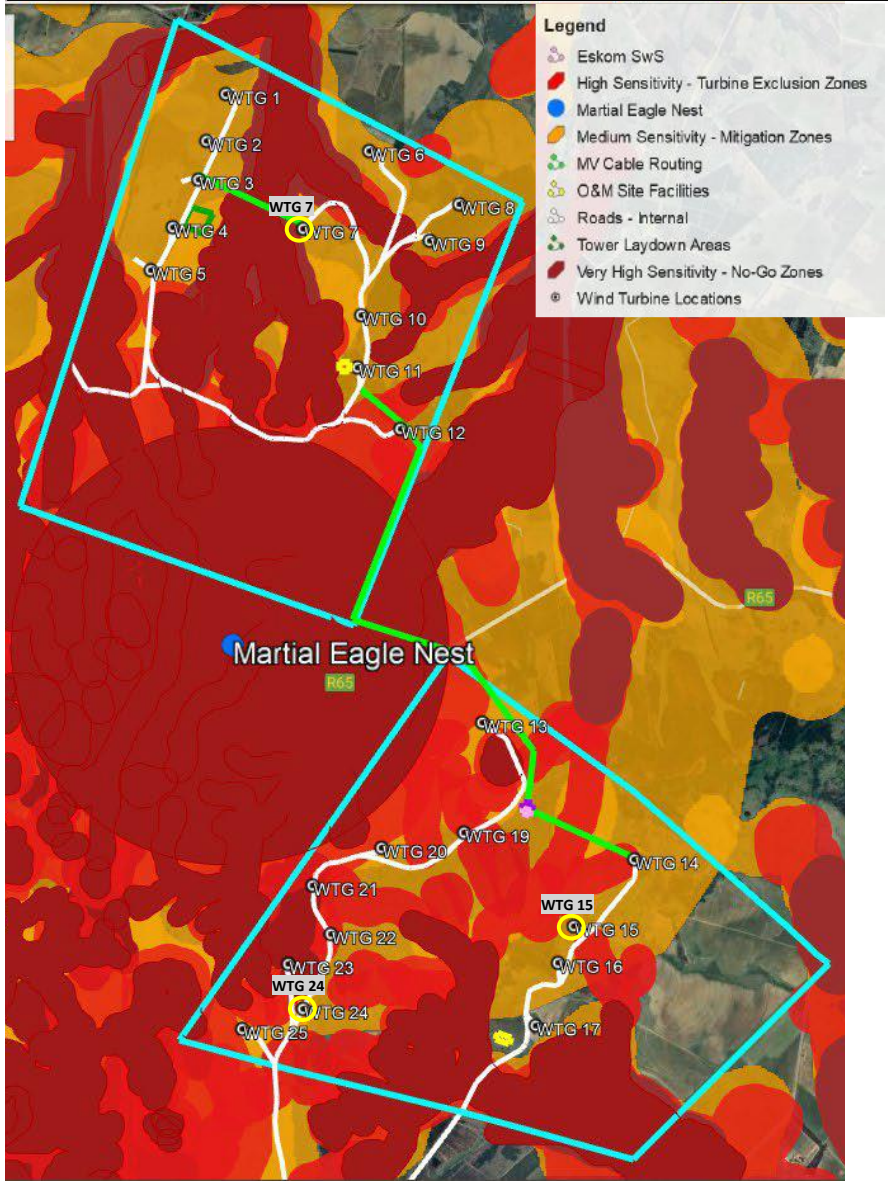
3.16. As evident from the foregoing discussion, as well as that in relation to avifaunal sensitivity, any assertion by the EAP that layouts have been changed, WTGs and infrastructure moved to avoid or reduce adverse impacts, are questionable. Such assertions must be interrogated by the Competent Authority and treated with caution. In fact, these claims cannot be relied upon and the manner in which information in this regard has been presented serves to compromise the entire EIA process. Moreover, it undermines the validity of significance ratings (over and above the weaknesses in the rating methodology highlighted in Section 4 of this document) pre-and post-mitigation.

4. INADEQUATE IDENTIFICATION AND ASSESSMENT OF IMPACTS

4.1. As noted in our previous comments (dated April 2025), the significance ratings of impacts reported by the EAP cannot be relied upon. It is inconceivable that in an environment that has so many highly sensitive environmental attributes, that not one single negative impact post-mitigation is rated more than being of 'moderate' significance. In general significance has been understated and this situation persists.

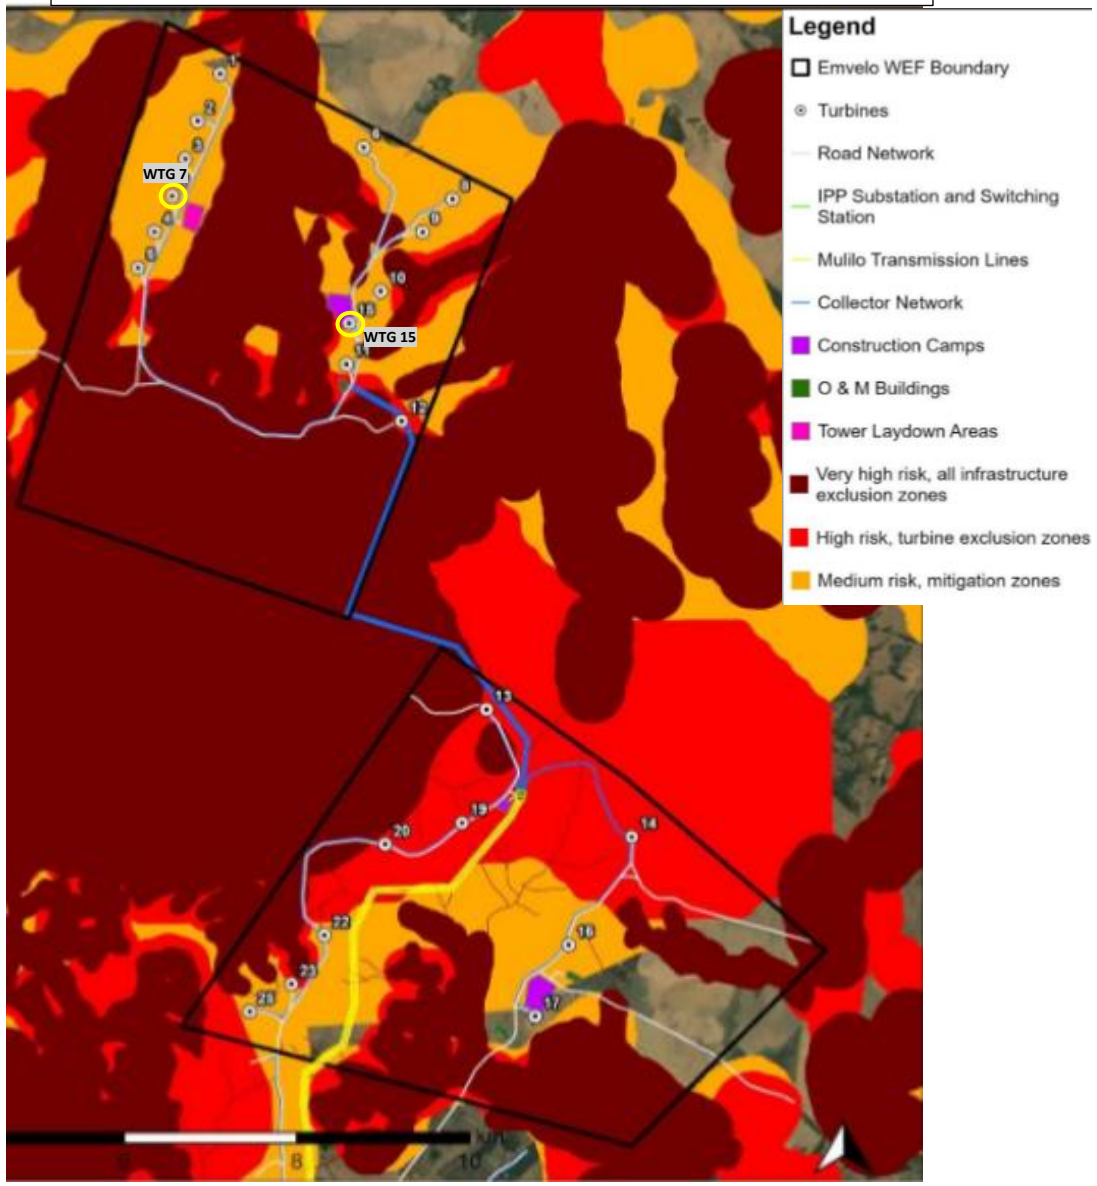
4.2. An example is the way the criterion "extent" is applied. To illustrate this point, avifauna is given as an example using the operational impact "Mortality due to Collisions with Turbines". The first problem is that all birds are considered as a single entity – there is no differentiation between Species of Conservation Concern versus other species. Where a species is listed globally as CE or E, then the extent of any impact that could cause mortality is a major concern at an international level and cannot be rated as medium in terms of extent. It is immediately apparent just from this single example of the criterion of "extent", that the result will be understatement of impact significance.

4.3. Impacts on policies and plans have not been assessed. For example, NPAES (National Protected Area Expansion Strategy) areas occur on the sites of both proposed WEFs. This is not shown on the sensitivity maps / diagrams. In addition, the impact on this strategy has not been assessed. Similarly, the potential impact of the proposed projects on conservation targets and objectives such as those expressed in the or on MBSP have not been assessed. There is also no indication that these types of policies, plans and programmes influenced impact significance rating.



4.4. The figures overleaf (extracted from Figure 39 of the Avifaunal Specialist Study) do show that WTG 7 was moved (in response to the sensitivity of Species 23). Relocation of WTG 15 as described in point 19 would seem to be disadvantageous in the context of Martial Eagle sensitivity. It is located closer to the Martial Eagle buffer (May 2025 Avifaunal Specialist Study) and also closer to the "Very high risk – all infrastructure exclusion zone". It is not known to what extent the relocation of WTG 15 was considered in the May 2025 Avian Specialist Study as no reference could be found to a specific discussion in this regard. Note that changed turbine positions are shown in yellow circles in the diagrams overleaf.

4.5. There are several WTGs that are still located within the Martial Eagle Turbine Exclusion Zone. These are WTGs 12, 13, 14, 19 and 20 are located. This was raised in the comments on the Draft EIA Report dated March 2025 (page 20 Emvelo CRR). In response the EAP states the following: "Noted. WTGs 12, 20 and 21 have been moved outside of the Avifaunal Turbine Exclusion Zone (Martial Eagle nest buffer), and WTG 13 has been micro sited to be located further away with the rotor swept area also not intersecting with this zone. This is simply not the case, which means this response by the EAP is **factually incorrect**. In fact, the specialist notes in his revised report (May 2025 – page 106) that these turbines need to be moved. Accordingly, the EAP has misrepresented the situation with regard to an extremely sensitive species.



4.6. Further to the above, fatality rate decreases described in the Avifaunal Specialist Study (Section 5.8.8) are open to question. It is unclear how the fatality rate for the Martial Eagle,

for example, can be predicted to reduce as much as described in of the specialist study, especially as the reduction of >50% is attributed to project layout changes. In the absence of specific details of what was changed so as to result in this predicted fall in fatality rates, together with clear diagrams showing 'before' and 'after' layouts, this conclusion cannot carry a high degree of certainty. This is particularly as the recommended buffer zone for Martial Eagles has not been adhered to (5-6 km not 2.5 km radius). Moreover, the layout itself does not appear to have altered so significantly relative to Martial Eagle sensitive areas so as to point to a substantial reduction in the threat of fatality. The following diagrams from the Avifaunal Specialist Studies provided with the Draft EIA Reports of March and July 2025 show that it is exceedingly difficult to discern layout changes that may have been in response to avifaunal sensitivities.

Combined Avian Sensitivity – Proposed Emvelo WEF (extract from Fig. 3.9 of February 2025 specialist study included in March 2025 Draft EIA

Combined Avian Sensitivity – Proposed Emvelo WEF (extract from Fig. 3.9 of May 2025 specialist study included in July 2025 Draft EIA Report

5. INADEQUATE APPLICATION OF THE MITIGATION HIERARCHY

Avoiding avoidance – the pinnacle of the mitigation hierarchy

5.1. One just has to consider the impact tables where one of the questions is: "Can impact be avoided, managed, or mitigated?" realise that the impact assessment methodology is based on a misconception of the mitigation hierarchy. The specialist response to the question "Can impact be avoided, managed, or mitigated?" is either "yes" or "no". There is no requirement to specify which mitigation strategy is being applied. Avoidance is different to management / mitigation, but the EAP makes no account for this. It is important to know whether the impact can be avoided as opposed to whether it can be mitigated. This ought to be explicitly explained by the EAP, but the EAP has failed to provide a rational explanation.

5.2. Avoidance is preferred and should always be considered before any other options in terms of the sequence of tiered steps mandated by the impact mitigation hierarchy. Definitively proving that avoidance has been implemented in accordance with the mitigation hierarch is something the EAP has categorically failed to establish.

5.3. The EAP's trend and preferred methodology – as shown in the Draft EIA Report - is to avoid 'avoidance' as the primary means for preventing adverse impacts in terms of the hierarchy. The EAP's approach flies in the face of IEM and the mitigation hierarchy because avoidance is assumed but not reflected in the project documentation. When working in such a sensitive environment, such as the sites of the proposed projects, it goes without question that AVOIDANCE should be top priority and a critical threshold to adhere to BEFORE proceeding to the following stages of the mitigation hierarchy. The role of the EAP is to ensure development is undertaken in a manner that ensures the interests of the biophysical environment and affected communities. This is an enormous responsibility and cannot be fulfilled if concerns raised by I&APs and conservation authorities are downplayed and effectively ignored. The impact assessment and public participation processes are materially inadequate.

5.4. Instead of avoiding areas of high sensitivity the EAP recommends pre-commencement flora relocation and faunal relocation (see for example page 384 Draft EIA Report). This is unacceptable and illustrative of a fundamentally defective approach to impact assessment and management. Areas of high sensitivity ought to be avoided outright in terms of the mitigation hierarchy. This has NOT been done.

5.5. There is no clarity of which species will be affected or whether they are good candidates for relocation (i.e. is the success of this proposed mitigation measure proven). The proposal to relocate species has associated impacts and these have NOT been assessed. In a scenario where relocation is unavoidable (i.e. all other options in terms of the mitigation hierarchy have been applied and exhausted) – **this constitutes a project impact and is not solely a proposed mitigation measure.**

5.6. It is stated "Several burrowing faunal species are present and will allow for relocation of less mobile species, although most faunal species in proximity are likely to vacate the area once

earth moving equipment commences clearing and construction, however some species may require manual relocation." Firstly, the way this proposal is framed is muddled / does not make sense. It reads like some sort of circular argument. Secondly, the impacts of relocation have not been assessed. Thirdly, once earth-moving equipment moves in, the project has commenced – which does not tie up with the proposed pre-commencement relocation of the sensitive species.

5.7. Inadequate thought has been given to relocation of plant and animal species, which results in the following unsubstantiated, bland and rather meaningless statement by the EAP: "They are relocated into a suitable habitat and protected from further damage and all disturbances to aid their re-establishment."

5.8. There are too many unanswered questions to place any reliance on this relocation proposal:

5.8.1. Have suitable alternative habitat locations been identified for relocation purposes? How far away are these and is the location accessible for this purpose? These questions are unanswered.

5.8.2. What is the impact of the faunal species that might be relocated? What about their wellbeing? These questions are unanswered.

5.8.3. How will they be caught so as to avoid trauma? Are they territorial species and if so, how will they be introduced into a new territory? How will faunal species in the new territory react? These questions are unanswered.

5.8.4. Has a faunal relocation expert been consulted? Where is the specialist input on relocation? These questions are unanswered.

5.9. The key priority and statutory obligation for an EAP is to determine whether a proposed project can respond to the environmental constraints present at the proposed location. This is the most important assessment and guidance that an EAP can provide. Instead, in this case, focus is placed on mitigation such as relocation of sensitive flora and fauna. It appears that little or no thought is given to the recipients or receiving environment of this relocation, as if one is dealing with environmental impact management is akin to dealing with inanimate objects.

5.10. There is also a disproportionate reliance placed by the EAP on reconsideration of WTG positions following a post-authorisation walkthrough. The question that has not been answered by the EAP is this: Why can such a walkthrough not be conducted during the EIA process when the specialists have been on site? Emphasis is placed on how much field work has been done, so why did this not include detailed examination of proposed WTG locations? For example (page 87 of the Emvelo CRR) concern is raised about the location of turbines and roads within Yellow-breasted Pipit habitat, contrary to the avifaunal specialist's recommendations. The EAP's response is "All WTGs were removed from Yellow-breasted Pipit habitat with the exception of WTG 23 that still appears to be fringing on a high-risk area as identified for the Yellow-breasted Pipit. It is recommended that this turbine position be

reconsidered following the avifaunal walkthrough, post-EA (should such EA be granted) prior to construction." It seems that WTG 31 (Sheepmoor) is also located on the edge of this bird's habitat.

5.11. There is reference to turbines having been micro-sited out of certain areas. See for example the Emvelo CRR (page 20) in relation to Martial Eagle. This raises the obvious question as to why micro-siting was not completed for all bird species and other environmental sensitivities. The maps are such that it is extremely difficult to discern whether the positions of turbines have changed, and this is due to lack of information on coordinates as mentioned elsewhere in this report. An explanation as to how the siting of WTGs was done is required. Was this done in field? When and how was micro-siting done? Were the edges between sensitive habitats and WTG positions verified in the field?

5.12. It is strange that if there is such precision about blade sweep and how far it extends and that it does not impinge into sensitive areas (see page 19 and 20 of Emvelo CRR) that more detailed diagrams / maps are not provided at a scale that clearly shows the difference between the before and after changes that have been made to the layout. Another example (page 36 of the Sheepmoor CRR) of this type of feedback is: "The Sheepmoor WEF has undergone significant layout refinement to avoid high-sensitivity areas, particularly Critical Biodiversity Areas (CBAs) and known flight paths of key species." Again, is one looks at the figures, it is extremely difficult to see any material difference in the layout.

5.13. Given the foregoing points, no reliance can be placed of assurances that the layout has been substantially changed and that micro-siting has been conducted. If this were the case, then the information presentation would be clearer, especially spatial information. Precise coordinates would be given of WTG positions before and after relocation, for example.

Misunderstanding of legal obligations – alien invasive legislation

5.14. Clearing of alien invaded areas is offered as a trade-off, at a ratio of 1:3 for direct loss of natural grassland habitat (as a trade-off or offset), in conjunction with other mitigation proposed by the terrestrial biodiversity specialist. This proposal is repeated many times in the Draft EIA Report for both proposed WEFs (e.g. page 32 Emvelo Draft EIA Report of July 2025). This proposal cannot be accepted as a trade-off or an offset. The reason is that this proposal is attached to the site of the proposed development, and the influence / impacts are not confined solely to the development footprint.

5.15. Furthermore, alien vegetation control is a legal requirement under the Alien and Invasive Species Regulations (GNR 1020 of 25 September 2020). As such, the meeting of a legal obligation cannot be used as a trade-off. Even if the WEF owner is not the same party as the landowner, this applies, because the WEF is being operated on that land. Thus, under the duty of care obligations under NEMA, the WEF operator is required to fulfil alien vegetation control obligations.

5.16. It may be argued that the WEF operator has no obligation to control alien invasive vegetation, especially that present prior to development. This is a weak argument because one of the

impacts associated with disturbance caused by the proposed development is the possible spread of alien invasive vegetation.

Misuse of biodiversity offsets

5.17. The proposed offset does not meet the required outcomes of the National Biodiversity Offset Guideline of 2023, which are that the offset outcomes must be ***practically measurable on the ground***. Importantly an offset must ensure that:

5.17.1. biodiversity is secured in the long term through the protection and appropriate management of ecosystems and species;

5.17.2. efforts to protect biodiversity in the long term contribute to the expansion of South Africa's protected area network, and are focused in areas identified as biodiversity priorities, with particular emphasis on the consolidation of protected areas and biodiversity priority areas and securing effective ecological links between priority areas; and

5.17.3. it contributes to the long-term security of biodiversity priority areas and maintains or improves their ecological condition, thereby resulting in tangible and measurable positive outcomes for biodiversity conservation 'on the ground'.

5.18. Internationally, research, capacity building, training and other activities are not recognised as 'offsets' but can be used to support, expedite, improve or bolster the outcomes required of an offset.

5.19. The offset report proposes various measures to deal with residual impacts on birds. Area-based offsets are not feasible; several offsite actions have been proposed in an effort to achieve no net loss of these species. How no nett loss of bird species through these measures is to be achieved is wholly unclear. Furthermore, since WEFs pose a threat of bird deaths the loss of a single bird within the category of a species categorised as Critically Endangered or Endangered is one too many and pushes the species ever closer to a tipping point.

5.20. 13.7 ha of the 31 ha total residual impacts are in CBA 1 which is, by definition, **IRREPLACEABLE** and constitute a **FATAL FLAW** as noted in the national offset guideline. i.e. 44% of the proposed footprint. Also, it is in a NPAES focus area (Fig 3.1 of the WSP Biodiversity Offset Report).

5.21. **No assurance that land can be secured for conservation**, and **no assurance of long-term protection of a possible offset area is provided**. There is passing mention of 'may' look at conservation servitudes, but that is all." To suggest that Mulilo can motivate to the lessor that the offset plan is part of "maintenance and repairs" is wholly unacceptable and nonsensical.

5.22. **Furthermore, suggesting that target areas be identified in the context the existing site due to having lease agreements in place is counter to the intention of offsets. This land is within**

the proposed project's sphere of influence – so it is in fact not an offset as applied internationally and as understood in the aforementioned national guideline.

5.23. There is no clarity on responsibility for managing the offset area(s) (i.e. who would implement the offset and do the work) and covering costs of the offset, and duration of liability. Talking about clearing of alien species 'in a (questionable) ratio of 1:3' as a 'trade-off or offset' is nonsense. Any offset site would need to be cleared of alien species as an integral part of its management.

5.24. Of the **proposed offset measures for birds** (Section 10.2 in Biodiversity Offset report) – only the bird flight diverters may be acceptable BUT evidence that this would translate into on-the-ground outcomes is required (i.e. improvement in bird populations commensurate with expected residual impacts/ reduction in numbers due to electrocution/ collision with turbines/ powerlines). These outcomes must be directly linked to the affected species. Furthermore, no basis is given for specifying 5000 bird diverters every 10 years.

5.25. Support of research programmes are not recognised as an offset.

5.26. All of the items listed are in fact what a responsible corporate citizen ought to be doing and therefore do not constitute a praiseworthy offset (see point 53 below), particularly in circumstances where the mitigation hierarchy has not been applied. The first or top priority in the mitigation hierarchy is to avoid the adverse impact in the first place. This is precisely the mitigation approach that has been avoided in the EIA process for these proposed WEFs. Avoidance would mean removing any WEFs that is within away from bird sensitive areas on the basis of the precautionary principle – meaning do more than the minimum. For example, if there is a general guideline buffer applicable to nest areas, then application of the precautionary principle would mean adding to this buffer, because of the uncertainties about bird movements, for example.

5.27. The use of an offset demonstrates that there are residual adverse impacts, which means that the project has significant adverse impacts associated with it. It is not proactive compliance as espoused by the EAP. "This BOR is not a reactive add-on; it reflects a proactive compliance, demonstrating that the project has embraced its environmental responsibilities. Significant resources, technical input, and time were invested to ensure the offset plan would stand up to scrutiny and deliver real conservation value. It is a key part of what gives this project its integrity, and the applicant is proud to include it as a cornerstone of the DEIR submission. It should provide the competent authorities with a clear assurance that residual impacts have not only been recognised, but systematically addressed, avoided where possible, and responsibly offset where unavoidable." Besides the fact that the foregoing paragraph is verbiage, it is also factually incorrect. This type of language is wholly inappropriate – the language is not objective and compromises the independence of the EIA process.

5.28. Additional comments and concerns regarding the Offset Report prepared by WSP include:

Re: Section 3.1.2 PRIORITY AREAS FOR PROTECTED AREA EXPANSION

5.28.1. How has this section influenced the need for and design of any offset? This information would have and should have been evident during project planning and should have triggered upfront offset development at the earliest stages of the design process. What was this not investigated by the EAP before the 11th hour of the EIA process?

Re: 3.2.1 ECOLOGICAL IMPORTANCE OF VEGETATION COMMUNITIES IN THE LSA

5.28.2. The applicable Guideline suggest that impacts on CBAs should be AVOIDED AT ALL COSTS, unless the CBA can be shown to be inaccurately mapped or otherwise wrongly determined. The actual drivers of why the area is designated a CBA are important in terms of understanding the impact, requisite offset (if possible) and offset design to accommodate the feature driving CBA.

Re: Figure 3-7 - Sheepmoor Vegetation Sensitivity

5.28.3. It is curious (and inexplicable) to note that the areas in green are mapped as only moderate sensitive - although from an avifaunal perspective many areas are rated High or VERY HIGH. Offsets must synthesize the full array of features to derive a trigger but this has not been undertaken by the EAP.

Re: Section 5 AQUATIC BIODIVERSITY OVERVIEW

5.28.4. It is not clear whether there are any significant impacts on wetland systems (for instance from stream crossings by access roads or buried power lines) and whether these may trigger wetland offsets? This is unresolved and unanswered. The gaps in information and inadequacy of the assessment and it is not possible for the Competent Authority to render an informed decision on such impacts.

Re: Section 6.1.2 FLORA

5.28.5. EAP to confirm whether this is the first time a footprint figure has been made available during the EIA process. If so, why is this information made available at the 11th hour only?

5.28.6. There is no table of impact areas by feature, with a clear indication of what ratio should be applied. In order to determine a final offset quantum that can be audited for compliance monitoring the relevant information is not tabled. How much invaded area needs to be cleared? This is not clear from the reports. How is it to be rehabilitated to secondary grassland? This is not clear from the reports. Does this qualify as an acceptable offset for loss of intact grassland? If so, why? Again, this is not clear from the reports.

5.28.7. There is no map to determine whether it is feasible compensate for loss of secondary grassland in corridors between intact patches that are ESA designated – but the EAP states:

"this impact to negligible levels with only a very small proportion of the footprint occurring in or near higher sensitivity areas. Very High Sensitivity or No- Go habitat has largely been avoided and reduced to an acceptable level."

5.28.8. The above contradicts what the Avifauna report says or the fact that there are impacted CBAs and ecological corridors and processes. only valid for narrow vegetation lens. What is the total footprint of these areas impacted? Who is able to determine whether the impacts significance is acceptable without the material underlying data which has not been made available?

Re: Section 6.1.3 FAUNA

5.28.9. Agreed. This requires a clear and compensatory offset. i hope it still is to be clarified how much and where? could the OHPL be constructed without a service road? It seems unlikely

5.28.10. In this finely dissected landscape, with no-go areas immediately adjacent to low sensitivity, micro-siting would seem vital to have been completed before arriving at an impact statement and an estimation of footprint and offset liability. This is a key and material flaw in the entire EIA process. This weakness in impact assessment methodology flies in the face of IEM and the mitigation hierarchy.

5.28.11. The report relies on an indefinable and this un-auditable requirement and is fatally flawed.

Re: Plant Species page 410

5.28.12. Any loss of intact or degraded grassland habitat in corridors or wetland catchments cannot be rated as a positive impact!

Re: Table 9-2 – Terrestrial habitat offset targets

5.28.13. How does this relate to the 180 ha indicated in the report above? This is an unacceptable impact. fully 40% of the impact is in CBA1 ?

Re: Section 10 CANDIDATE OFFSET SITES

5.28.14. There is no candidate list, or any credible analysis of the contribution of each? do sufficient sites exist? are the landowners amenable to having their activities curtalied?

5.28.15. There is no evidence these lease conditions include restriction of farming activities and proactive biodiversity management. When were they signed, and has proof been submitted to the authorities?

5.28.16. Much of the assessment is entirely theoretical. Actual offset sites need to be identified and the specifics of their rehabilitation are determined to assess functional gains before

a decision can be made. More specifics would have helped the decision maker here regarding the biodiversity impacts

5.28.17. Rehab of grasslands is difficult and expensive, and often incomplete/inconclusive. restoration is likely impossible - especially to achieve prior diversity levels and structure, and keep invasive and alien species out.

Re: Section 10.1 SIGNED LEASE AGREEMENTS

5.28.18. The mooted lease agreements are likely to be contested by the landowners. A dedicated offset lease agreement and servitude - with accompanying management plan setting out the requisite outcomes - should have been concluded with the sites but this has not been done. . All of these proposed offset areas will be adjacent to the WEF/ WTG and this is questionable in terms of offset efficacy.

5.28.19. There is little indication of competing interests which might undermine potential offset efficacy e.g. Mining & Prospecting Rights, and the limits that these rights might impose on the applicants' ability to attain offset outcomes

Re: Section 11 10.2 OFFSITE ACTIONS FOR PRIORITY BIRD SPECIES

5.28.20. None of the actions listed qualify as offsets, or are so insufficiently described as to be so vague and meaningless that it is impossible to link the action directly to an impact (which methodology is expressly prohibited by the Offset Guideline). The reason being that the impact is not quantifiable and is unauditable based on the available information.

Re: Section 11 RECOMMENDED CONDITIONS FOR ENVIRONMENTAL AUTHORISATION

5.28.21. The quantum needs to be specified here, but it isn't quantified. The final status and/or protection and management regime need to be confirmed but this information has not been made available

5.28.22. There is insufficient information to demonstrate that the landowner has consented to the proposed arrangement. It is also not clear how certain this outcome is and whether this is covered in the lease conditions.

Re: Section: AFFECTED TERRESTRIAL HABITATS

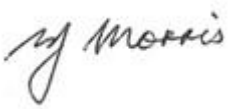
5.28.23. This assessment is meaningless unless attached to a specific infrastructure element, which it is not. In the circumstances, the DFFE is unable to determine accurately what the offset liability is should they choose to only approve a portion of the project

The reliance on micro-siting

5.29. Whilst post-approval micrositing is applied internationally in the wind energy sector, this is

within very specific limitations. According to Scottish Natural Heritage[1], for example, the siting of wind turbines in small incremental distances and is used at two main stages of wind farm development:

5.29.1. Firstly, during the design stage to ensure that turbine layout is satisfactory from key viewpoints and achieves the design objectives.



5.29.2. Secondly, during the construction phase of a project, where previously unexpected conditions are encountered on site.

5.30. Provision for micrositing is normally covered by a specification in the EIA Report which can then be included in the conditions in the approval. This serves to set a limit within which micrositing is permitted and normally limits this to 50-100m from the specified (approved) turbine location. This information ought to be known to ERM South Africa, since exactly this approach is applied by the company in the UK (for example Crosbie Wind Farm.[2]

5.31. From the foregoing information it can be seen that micrositing is not to be applied in a non-specific manner. It is recognised that some flexibility is required in final design stages and also to allow for unforeseen circumstances during construction. It is standard and accepted practice internationally to specify a distance limitation within which micrositing is permitted. This must of course be included in the project description and included in the impact assessment. This way, I&APs and the Competent Authority are provided with a full picture of the potential development footprint (including the micrositing zone) and the associated footprint. More importantly, it means the Competent Authority has full information and can include a specific zone for each WTG within which micrositing is permissible. Hence, this is clear and known to the Competent Authority upfront from the provision of this information in the EIA Report, instead of being faced with an unknown quantity in terms of

Good day Lucien,

We are in the process of finalising a response to the attached, could you please provide responses to the following:

- EAP to provide clarification and factual circumstances regarding whether impacts on the nature conservancy have been or will be considered in the EA Application documents, as this is a factual query.
- Please confirm whether the 22 April Letter, and our responses thereto will be included in the public participation report for the EA Application?

Kind Regards,

Lloyd Barnes

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Subject: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft EIA Reports for the proposed Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30-day comment period from 15 July 2025 to 14 August 2025.

Following the public review period of the Draft EIA Report, comments from MDARDLEA and MTPA, particularly related to biodiversity mitigation measures, necessitated additional inputs from the specialists. The DFFE granted an extension to the timeframes of the EIA process, in line with Regulation 3(7) of the EIA Regulations, 2014, as amended and the Final EIA Report was stated to be due on or before 25 August 2025. As a result, a second public commenting period of 30 days is therefore opened on the Draft EIA Report to ensure transparency and to allow stakeholders the opportunity to review the revised report, studies and Comments and Responses prior to submission of the Final EIA Report.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final EIA Report. More information on how you are able to participate in this process is attached in the above documentation. Please indicate which application your comment in respect of.

Thank you and regards,

Stephanie Gopaul

Hi Jamie,

I hope this message finds you well.

As part of the current Comments and Responses process, a number of specific WTGs have been called out by both departments and I&APs. Lloyd has taken the liberty of compiling a list of all such turbines and providing descriptions of the actual ground-truthed environmental conditions at each location.

We kindly request that you review these descriptions and provide your agreement and sign-off on their accuracy. Your confirmation is essential, as this information will also need to be shared with the specialist responsible for the Biodiversity Offset Report.

Given the tight timelines, we would greatly appreciate a very quick turnaround on this request. For your reference, we have attached the relevant I&AP comments alongside Lloyd's list.

Please let me know if you require any additional information to complete this review.

Regards

EXTERNAL MESSAGE

Hi Lucien, here are the reports with the revised layouts replaced where applicable (the last few maps in the reports).

There is an overlap with the Emvelo/Sheepmoor boundary that was provided where a central area fall within both sites. I have not had time to figure out what's going on there or to scrutinise the layout to check if there are any changes that affect the outcome of the assessment.

Subject: RE: Notification of Submission: Draft EIA Report Sheepmoor and Emvelo Wind Energy Facilities, Mpumalanga Province

Good day Lucien,

We are in the process of finalising a response to the attached, could you please provide responses to the following:

- EAP to provide clarification and factual circumstances regarding whether impacts on the nature conservancy have been or will be considered in the EA Application documents, as this is a factual query.

The landscape-level impacts associated with the proposed wind farm have been assessed by the relevant specialists, including the visual, faunal, and avifaunal specialists. Appropriate mitigation measures will be implemented to manage potential impacts. In particular, specific mitigation measures relating to large terrestrial bird species, such as the Secretarybird, have been outlined in detail within the avifaunal specialist reports

- Please confirm whether the 22 April Letter, and our responses thereto will be included in the public participation report for the EA Application?

Please note that the original letter dated 22 April was submitted outside of the Public Participation Process (PPP) period and was therefore not included in the original publication report. However, as the letter has since been resubmitted during the current PPP period, within the prescribed timeframes, both the letter and our responses will be incorporated into the Final Comments and Responses Report (CRR).

Kind Regards,

Lloyd Barnes

Hi Jamie,

Over and above we have also received comment from MTPA which does require Terrestrial biodiversity input. Kindly see attached these comments for your attention.

I do apologize for the short notice we have on this project, but we do intend to submit the final by the end of the week on the 22 Aug. Please do let me know if you can accommodate us with these comment responses?

Dear Specialist,

I trust you are well.

Please find attached the final layout for the proposed Amsterdam WEF as received from the applicant. Kindly update your respective specialist reports to reflect this final layout, and to submit your revised reports by

Monday, 12 August 2025.

If, for any reason, you anticipate that you will not be able to meet this deadline, please inform me as soon as possible so that we can explore alternative arrangements.

Thank you for your continued support and contributions to the project. Should you have any questions or require any additional information, please don't hesitate to reach out.

Kind regards,

EXTERNAL MESSAGE

Dear Lucian,

Your request is received but kindly note the following:

Due Dates - Due to committed site visits taking place on 11 and 12 August 2025, unfortunately it is not possible to meet the due date of 12 August 2025. The revised issue date must consider both the updating and internal reviews which would be at least one (1) week.

Variation Order - Our team will review the final layouts and determine whether the changes will require and Addendum Letter or Full Revisions to be issued. The time and effort for updating the reports (full revisions) will require a variation order which will be confirmed and communicated to you for approval.

Trust you find the above in order.

Kind regards

Hi Jamie,

I hope this message finds you well.

As part of the current Comments and Responses process, a number of specific WTGs have been called out by both departments and I&APs. Lloyd has taken the liberty of compiling a list of all such turbines and providing descriptions of the actual ground-truthed environmental conditions at each location.

We kindly request that you review these descriptions and provide your agreement and sign-off on their accuracy. Your confirmation is essential, as this information will also need to be shared with the specialist responsible for the Biodiversity Offset Report.

Given the tight timelines, we would greatly appreciate a very quick turnaround on this request. For your reference, we have attached the relevant I&AP comments alongside Lloyd's list.

Please let me know if you require any additional information to complete this review.

Hi Reabetswe,

Understood, thanks for informing me. From my visual inspection, here has not been WTG or road changes, just minor infrastructure footprint changes. If I could please refer you to the boundary KMZs, these have been changed. I kindly bare in mind when updating any figures within reports.

Can I expect the changes to the report on Wednesday?

Regards,

Lucien Barbeau

EXTERNAL MESSAGE

Dear Lucian,

Your request is received but kindly note the following:

Due Dates - Due to committed site visits taking place on 11 and 12 August 2025, unfortunately it is not possible to meet the due date of 12 August 2025. The revised issue date must consider both the updating and internal reviews which would be at least one (1) week.

Variation Order - Our team will review the final layouts and determine whether the changes will require and Addendum Letter or Full Revisions to be issued. The time and effort for updating the reports (full revisions) will require a variation order which will be confirmed and communicated to you for approval.

Trust you find the above in order.

Kind regards

Reabetswe MOKOMELE

Subject: Mulilo Amsterdam Final Layout - [12 AUG 225]

Dear Specialist,

I trust you are well.

Please find attached the final layout for the proposed Amsterdam WEF as received from the applicant. Kindly update your respective specialist reports to reflect this final layout, and to submit your revised reports by Monday, 12 August 2025.

If, for any reason, you anticipate that you will not be able to meet this deadline, please inform me as soon as possible so that we can explore alternative arrangements.

Thank you for your continued support and contributions to the project. Should you have any questions or require any additional information, please don't hesitate to reach out.

Kind regards,

ERM

EXTERNAL MESSAGE

Hi Lucien, please see attached.

I've done what I can, but the time available is extremely limited to be able to respond adequately to these comments. If there were a few weeks available I'd have liked to have been able to rock the boat a bit on some of those comments, but have tried to keep it as unconfrontational as possible.

I notice that both authorities are still stuck on the same issues, and are still not giving attention to the ground truthing of the MBSP and just ignoring the findings and still comparing with the official MBSP. Its a case of not seeing the forest for the trees I guess, or purely that it doesn't serve their interests, so they only pay attention to what serves their interests. I'm also noticing that perhaps Mr Lotter (I see he's on both letters) is not having a more personal attack on anything that steps on 'his MBSP', which would bring into question its validity. Hopefully the DFFE will apply a more balanced outlook, I haven't seen much from them comment wise.

I also added a comment to each of the WTGs as per the table from Lloyd.

Regards
Jamie

Hi Jamie,

I hope this message finds you well.

As part of the current Comments and Responses process, a number of specific WTGs have been called out by both departments and I&APs. Lloyd has taken the liberty of compiling a list of all such turbines and providing descriptions of the actual ground-truthed environmental conditions at each location.

We kindly request that you review these descriptions and provide your agreement and sign-off on their accuracy. Your confirmation is essential, as this information will also need to be shared with the specialist responsible for the Biodiversity Offset Report.

Given the tight timelines, we would greatly appreciate a very quick turnaround on this request. For your reference, we have attached the relevant I&AP comments alongside Lloyd's list.

Please let me know if you require any additional information to complete this review.

Hi Lucien I will take a look and get responses to you.

You had let us know about the responses so had kept a window this week.

I'll get them to you as soon as I can, I will just need to taka a look and may need to give some thought for a day or two or do some further analysis depending on what they are.

I note the timeline and will try get to you by end Wednesday or sooner if they are not too comlplex.

Regards
Jamie

EXTERNAL MESSAGE

Hi Lucien, here are the reports with the revised layouts replaced where applicable (the last few maps in the reports).

There is an overlap with the Emvelo/Sheepmoor boundary that was provided where a central area fall within both sites. I have not had time to figure out what's going on there or to scrutinise the layout to check if there are any changes that affect the outcome of the assessment.

TERRESTRIAL BIODIVERSITY: COMMENTS & RESPONSES: FINAL EIR (2025/08/20)

COMMENT	RESPONSE
EMVELO DARDLEA	
2. The proposed Emvelo Wind Energy Facility and associated grid infrastructure is located on a site comprising: CSA Irreplaceable and Optimal; Intact Grassland Patches; Key Biodiversity Areas; the Grasslands Important Bird Area (IBA); Ecological Support Areas; National Protected Area Expansion Strategy Areas (NPAES); Threatened Ecosystems - including Wakkerstroom Montane Grassland and Eastern Highveld Grassland; CSA: Aquatic Rivers; ESA: Strategic Water Source Area; ESA: Wetlands and ESA: Important Sub-catchments.	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked.
5. DARDLEA is not supportive of development of WEFs (or any non-compatible land use) within Critical Biodiversity Areas and Key Biodiversity Areas, or within intact grassland patches. In respect of Intact Grassland Patches, it is important to note that the Mpumalanga Biodiversity Sector Plan (MBSP) specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened fauna and avifauna. This is verified in the fauna! assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area". Intact Grassland Patches are important source areas in terms of metapopulation dynamics. The MBSP - adopted in 2023 (Provincial Notice 279 of 2023) - is a planning tool that has been developed to manage biodiversity resources of the province by setting strategic objectives to ensure that spatial biodiversity and climate change priorities are effectively incorporated into land-use and development planning, environmental assessments and authorisations, and natural resource management within Mpumalanga Province. The links to the various reports and shape files, including the MBSP Technical Report which details the scientific methods used to identify Intact Grassland Patches, can be accessed at https://mtpa. maps. ArcGIS. com/sharing/rest/content/items/fc6d8f9e 7 ef84d2f87f86b91 e8e9f87 *a/d*ata).	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings. The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).
11. The number of turbines that are located in areas recommended for avoidance (at least 16 out of 22), and the location of the roads, construction camps and OHLs in sensitive areas demonstrates that the site is not compatible with the proposed land use. The areas of concern as they relate to the abovementioned comments, are outlined below:	Refer to separate table. The comments are not giving consideration to the ground truthed findings (for example where it is designated CBA as per MBSP, but in fact it's in the middle of a mielie field).

14. The Terrestrial Assessment (inclusive of Plant Species) did not apply the Site Ecological Importance (SEI) methodology, which is a requirement of the Species Environmental Assessment Guideline. The Species Protocols specifically stipulate that assessments "must be undertaken in accordance with the *Species Environmental Assessment Guideline"* (South African National Biodiversity Institute, 2020. Species Environmental Assessment Guideline. Guidelines for the implementation of the Terrestrial Fauna and Terrestrial Flora Species Protocols for environmental impact assessments in South Africa. South African National Biodiversity Institute, Pretoria). Non-compliance with the *Species Environmental Assessment Guideline* has resulted in the following deficiencies: 14.1. Insufficient time was allocated to surveying in the appropriate season (only 4 days for both Sheepmoor and Emvelo WEF sites, as well as the Grid sites). 14.2. The classification of the Montane Grassland on site as "moderate sensitivity" in the absence of applying all relevant criteria, including *inter alia,* conservation importance, functional integrity, receptor resilience, as well as species of conservation concern, spatial priorities, intact grassland patches, and CBAs. 14.1. The montane ridge (where WTGs 13, 19, 20, 22, 23 and 25, along with grid infrastructure are proposed), which also coincides with intact grassland and the highest sensitivity for Fauna (according to the Faunal Assessment), being classified as "moderate sensitivity". (Noting further that according to the Fauna Assessment, "the high sensitive escarpment area is likely of general importance for a range of faunal groups, representative of a large contiguous and ecologically intact area of mostly good-quality montane grassland". If the correct and required criteria are applied, the classification of this area is more likely to be classified as "High" or "Very High Sensitivity".	Incorrect deduction regarding number of days on site – refer to clear outline of dates provided under site visit in Terrestrial Biodiversity Assessment Report, which was more than 4 days across two seasonal visits. This was clarified in the draft comments and responses but is still being incorrectly stated in the MPTA comments as being 4 days only. The MPTA correctly states that 4 days is inadequate, <u>which is why 10 days were spent on site</u>. A preliminary overview site visit was conducted on 18 April 2023 (late autumn/early winter) for the purposes of a high-level reconnaissance of the site, followed by a further site visit between 19 & 22 June 2023 (winter) in order to undertake the preliminary screening, site sensitivity mapping and survey. A final comprehensive site visit and survey was undertaken between 09 & 13 December 2024, which constituted the summer seasonal site visit and assessment and also served to inform final layout design. This constitutes a sampling period of 10 days, which was deemed to be adequate for such an assessment. The blanket designation of an entire vegetation unit based on species that might be represented locally within that vegetation unit, would be incorrect. If the species represented were to inhabit the entire vegetation unit, then it is likely that they would not be considered to have an elevated conservation status, as they would be common.
15. As a result of the deficiencies in the Terrestrial Assessment outlined above, we have low confidence in the associated impact analysis, and dispute the Specialist's "low" significance ratings.	This project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The overall impact is thus low.
18. Biodiversity Offset Strategy: 18.1. According to the Biodiversity Offset Guideline, *"The desired outcome of biodiversity offsets is to ensure that - the cumulative impact of an authorised activity, or activities, and land and resource use change does not: result in the loss of irreplaceable biodiversity or jeopardise the ability to meet biodiversity targets; lead to any ecosystem with a threat status of Vulnerable or Least Concern becoming Endangered; or any Endangered ecosystem becoming Critically Endangered; or cause an irreversible decline in the conservation status of species and the presence of special habitats: or cause a significant loss in ecosystem services".* A biodiversity offset cannot therefore cater for the loss of Irreplaceable CBAs or intact	The layout has sought to avoid the most sensitive areas and prioritise lower sensitivity areas. In order for the project to be feasible some footprints may extend into higher sensitivity areas, but these can be specifically managed. The layout provided includes only road and turbine positions, not final design. The final design will include the actual footprint and it can be undertaken in such a manner that loss can be minimised (for example, where a turbine position (i.e. the point on the map) falls on the edge of or slightly within an elevated

grasslands. As detailed in the comments above, intact grasslands are crucial for supporting threatened fauna and avifauna. 18.2. The Biodiversity Offset Guideline specifically states that "biodiversity offsets are not appropriate when an activity, or activities, will have residual impacts on biodiversity of very high significance, including when residual negative impacts will result in loss of irreplaceable biodiversity". 18.3. In addition to Irreplaceable CBAs, the Biodiversity Offset Guideline also categorises the following as "irreplaceable biodiversity": Biodiversity of major potential concern, where residual impacts in this category could lead to - loss of vulnerable or potentially irreplaceable biodiversity in areas of recognised importance, such as - areas evaluated as having High Ecological Site Importance. We maintain that the correct and required implementation of the Species Environmental Assessment Guideline would have resulted in the Montane Grassland being classified as having High Ecological Site Importance. 18.4. The Intact Grassland Patches on the site must therefore be avoided, and cannot be offset. The requirement to consider biodiversity offsets is applicable only once it has been demonstrated that all measures of avoidance have been exhausted. The loss of irreplaceable biodiversity cannot be offset, and, as outlined above, "irreplaceable biodiversity" includes, key ecological corridors recognized as important for evolutionary processes and climate change adaptation where no options to safeguard these processes exist. 18.5. Furthermore, the Biodiversity Offset Report does not meet the following minimum requirements: i. A portfolio of candidate biodiversity offset sites, including the likelihood of each site's availability and feasibility. ii. The required biodiversity outcomes on each of the candidate biodiversity offset sites.	sensitivity area, the actual hard stand area can be aligned so that as much as possibly falls outside of the 'sensitive' area. Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context).
19. Cumulative Impact Assessment: 19.1. In our comments dated 10 April 2025 on your original draft EIA, despite bringing another 5 approved and in-process WEFs (within a 35 km radius) to your attention (i.e. Zephyr, Ujekamanzi Ntabande and Daggafoort and Emvelo), your revised cumulative impact assessment once again fails to mention or assess these. Subsequently, there are now an additional 3 WEFs within 35 km that are now in-process, i.e. Leghoya WEF 1, 2 & 3, and another one (1) within a 55 km radius (i.e. Anemoi WEF). 19.2. Furthermore, although section 4.3.3 states that "the scope of this assessment will include all operational, approved or current and planned renewable energy applications", in addition to the approved or in-process WEFs identified in 17 .1. above (not included in this assessment), there are actually an additional two (2) WEFs within 35 km and a further	Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context). The comment is again quoting the total project area rather than the actual WEF footprint of the projects included in the calculation. Only a small proportion of the grassland will be transformed (i.e. the

two (2) proposed WEFs (i.e. Pre-Application) within a 55 km radius, that have not been identified. The total number of turbines within 35 km is more than double that indicated in both the Draft EIA and Revised Draft EIA reports, i.e. 435 (and not 192) and within a 55 km radius there are more than 663 turbines (approved, in-process and proposed). As a minimum, the cumulative impact of approved and in-process applications must be assessed. 19.3. Avifauna 19.4. Fauna 19.5. DFFE also requires that "the cumulative impact assessment for all identified and assessed impacts must indicate the following: (a) Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e. hectares of cumulatively transformed land". The Revised EIA Report does again not accurately quantify the size of the identified impacts, i.e. hectares of cumulatively transformed land. The overall footprint size of this, and all other similar proposed and approved renewable energy facilities within a 35 km radius is now 178 017.24 ha (Approved: 31 440.17 ha, In Progress: 89 247.96 ha, Pre-Application: 57 329.11 ha). Again, as a minimum, the cumulative impact of approved and in-process applications must be assessed. 19.6. Avifauna	actual road, WEF and other infrastructure footprint. The grassland that is retained will still function.
SHEEPMOOR DARDLEA	
3. The proposed Sheepmoor Wind Energy Facility and associated grid infrastructure is located on a site comprising: CBA Irreplaceable and Optimal; Intact Grassland Patches; Key Biodiversity Areas; the Grasslands Important Bird Area (IBA); Ecological Support Areas; National Protected Area Expansion Strategy Areas (NPAES); Local-scale and Landscape-scale Climate Change Corridors; Threatened Ecosystems - including Wakkerstroom Montane Grassland and Eastern Highveld Grassland; CBA: Wetlands; CBA: Aquatic Rivers; ESA: Strategic Water Source Area and ESA: Important Sub-catchments.	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked.
6. DARDLEA is not supportive of development of WEFs (or any non-compatible land use) within Critical Biodiversity Areas and Key Biodiversity Areas, or within intact grassland patches. In respect of Intact Grassland Patches, it is important to note that the Mpumalanga Biodiversity Sector Plan (MBSP) specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened fauna and avifauna. This is verified in the fauna! assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings.

conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area". Intact Grassland Patches are important source areas in terms of metapopulation dynamics. The MBSP - adopted in 2023 (Provincial Notice 279 of 2023) - is a planning tool that has been developed to manage biodiversity resources of the province by setting strategic objectives to ensure that spatial biodiversity and climate change priorities are effectively incorporated into land-use and development planning, environmental assessments and authorisations, and natural resource management within Mpumalanga Province. The links to the various reports and shape files, including the MBSP Technical Report which details the scientific methods used to identify Intact Grassland Patches, can be accessed at https://mtpa. maps. ArcGIS. com/sharing/rest/content/items/fc6d8f9e 7 ef84d2f87f86b91 e8e9f87 *a/d*ata).	The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).
12. The number of turbines that are located in areas recommended for avoidance (at least 17 out of 25), and the location of the O&M building, roads and OH Ls in sensitive areas demonstrates that the site is not compatible with the proposed land use. The areas of concern as they relate to the abovementioned comments, are outlined below:	Refer to separate table. The comments are not giving consideration to the ground truthed findings (for example where it is designated CBA as per MBSP, but in fact it's in the middle of a mielie field).
14. The Terrestrial Assessment (inclusive of Plant Species), did not apply the Site Ecological Importance (SEI) methodology, which is a requirement of the Species Environmental Assessment Guideline. The Species Protocols specifically stipulate that assessments "must be undertaken in accordance with the *Species Environmental Assessment Guideline"* (South African National Biodiversity Institute, 2020. Species Environmental Assessment Guideline. Guidelines for the implementation of the Terrestrial Fauna and Terrestrial Flora Species Protocols for environmental impact assessments in South Africa. South African National Biodiversity Institute, Pretoria). Non-compliance with the *Species Environmental Assessment Guideline* has resulted in the following deficiencies: 14.1. Insufficient time was allocated to surveying in the appropriate season (only 4 days for both Sheepmoor and Emvelo WEF sites, as well as the Grid sites). 14.2. The classification of the Montane Grassland on site as "moderate sensitivity" in the absence of applying all relevant criteria, including *inter alia,* conservation importance, functional integrity, receptor resilience, as well as species of conservation concern, spatial priorities, intact grassland patches, and CBAs. 14.1. The montane ridge (where WTGs 26, 27, 28, 29, 30 and 33, along with grid infrastructure are proposed), which also coincides with intact grassland and the highest sensitivity for Fauna (according to the Fauna! Assessment), being classified as "moderate sensitivity". (Noting further that according to the Fauna Assessment, "the high sensitive escarpment area is likely of general importance for a range of fauna! groups,	Incorrect deduction regarding number of days on site – refer to clear outline of dates provided under site visit in Terrestrial Biodiversity Assessment Report, which was more than 4 days across two seasonal visits. This was clarified in the draft comments and responses but is still being incorrectly stated in the MPTA comments as being 4 days only. The MPTA correctly states that 4 days is inadequate, which is why 10 days were spent on site. A preliminary overview site visit was conducted on 18 April 2023 (late autumn/early winter) for the purposes of a high-level reconnaissance of the site, followed by a further site visit between 19 & 22 June 2023 (winter) in order to undertake the preliminary screening, site sensitivity mapping and survey. A final comprehensive site visit and survey was undertaken between 09 & 13 December 2024, which constituted the summer seasonal site visit and assessment and also served to inform final layout design. This constitutes a sampling period of 10 days, which was deemed to be adequate for such an assessment. The blanket designation of an entire vegetation unit based on species that might be represented locally within that vegetation unit, would be incorrect. If the species represented were to inhabit the entire

representative of a large contiguous and ecologically intact area of mostly good-quality montane grassland".	vegetation unit, then it is likely that they would not be considered to have an elevated conservation status, as they would be common.
15. As a result of the deficiencies in the Terrestrial Assessment outlined above, we have low confidence in the associated impact analysis, and dispute the Specialist's "low" significance ratings.	This project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The overall impact is thus low.
17. Cumulative Impact Assessment: 17.1. In our comments dated 10 April 2025 on your original draft EIA, despite bringing another 5 approved and in-process WEFs (within a 35 km radius) to your attention (i.e. Zephyr, Ujekamanzi Ntabande and Daggafoort and Emvelo), your revised cumulative impact assessment once again fails to mention or assess these. Subsequently, there are now an additional 3 WEFs within 35 km that are now in-process, i.e. Leghoya WEF 1, 2 & 3, and another one (1) within a 55 km radius (i.e. Anemoi WEF). 17.2. Furthermore, although section 4.3.3 states that "the scope of this assessment will include all operational, approved or current and planned renewable energy applications", in addition to the approved or in-process WEFs identified in 17 .1. above (not included in this assessment), there are actually an additional two (2) WEFs within 35 km and a further two (2) proposed WEFs (i.e. Pre-Application) within a 55 km radius, that have not been identified. The total number of turbines within 35 km is more than double that indicated in both the Draft EIA and Revised Draft EIA reports, i.e. 435 (and not 192) and within a 55 km radius there are more than 663 turbines (approved, in-process and proposed). As a minimum, the cumulative impact of approved and in-process applications must be assessed. 17.3. Avifauna 17.4. Fauna 17.5. DFFE also requires that "the cumulative impact assessment for all identified and assessed impacts must indicate the following: (a) Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e. hectares of cumulatively transformed land". The Revised EIA Report does again not accurately quantify the size of the identified impacts, i.e. hectares of cumulatively transformed land. The overall footprint size of this, and all other similar proposed and approved renewable energy facilities within a 35 km radius is now 178 017.24 ha (Approved: 31 440.17 ha, In Progress: 89 247.96 ha, Pre-Application: 57 329.11 ha). Again, as a minimum, the cumulative impact of approved and in-process applications must be assessed. 17.6. Avifauna	Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context). The comment is again quoting the total project area rather than the actual WEF footprint of the projects included in the calculation. Only a small proportion of the grassland will be transformed (i.e. the actual road, WEF and other infrastructure footprint. The grassland that is retained will still function. The layout has sought to avoid the most sensitive areas and prioritise lower sensitivity areas. In order for the project to be feasible some footprints may extend into higher sensitivity areas, but these can be specifically managed. The layout provided includes only road and turbine positions, not final design. The final design will include the actual footprint and it can be undertaken in such a manner that loss can be minimised (for example, where a turbine position (i.e. the point on the map) falls on the edge of or slightly within an elevated sensitivity area, the actual hard stand area can be aligned so that as much as possibly falls outside of the 'sensitive' area. Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context).

19. Biodiversity Offset Strategy: According to the Biodiversity Offset Guideline, *"The desired outcome of biodiversity offsets is to ensure that - the cumulative impact of an authorised activity, or activities, and land and resource use change does not: result in the loss of irreplaceable biodiversity or jeopardise the ability to meet biodiversity targets; lead to any ecosystem with* a *threat status of Vulnerable or Least Concern becoming Endangered; or any Endangered ecosystem becoming Critically Endangered; or cause an irreversible decline in the conservation status of species and the presence of special habitats; or cause a significant loss in ecosystem services".* A biodiversity offset cannot therefore cater for the loss of Irreplaceable CBAs or intact grasslands. As detailed in the comments above, intact grasslands are crucial for supporting threatened fauna and avifauna. 19.2. The Biodiversity Offset Guideline specifically states that "biodiversity offsets are not appropriate when an activity, or activities, will have residual impacts on biodiversity of very high significance, including when residual negative impacts will result in loss of irreplaceable biodiversity". 19.3. In addition to Irreplaceable CBAs, the Biodiversity Offset Guideline also categorises the following as "irreplaceable biodiversity": Biodiversity of major potential concern, where residual impacts in this category could lead to - loss of vulnerable or potentially irreplaceable biodiversity in areas of recognised importance, such as - areas evaluated as having High Ecological Site Importance. We maintain that the correct and required implementation of the Species Environmental Assessment Guideline would have resulted in the Montane Grassland being classified as having High Ecological Site Importance. 19.4. The Intact Grassland Patches on the site must therefore be avoided, and cannot be offset. The requirement to consider biodiversity offsets is applicable only once it has been demonstrated that all measures of avoidance have been exhausted. The loss of irreplaceable biodiversity cannot be offset, and, as outlined above, "irreplaceable biodiversity" includes, key ecological corridors recognized as important for evolutionary processes and climate change adaptation where no options to safeguard these processes exist. 19.5. Furthermore, the Biodiversity Offset Report does not meet the following minimum requirements: i. A portfolio of candidate biodiversity offset sites, including the likelihood of each site's availability and feasibility. ii. The required biodiversity outcomes on each of the candidate biodiversity offset sites.	The layout has sought to avoid the most sensitive areas and prioritise lower sensitivity areas. In order for the project to be feasible some footprints may extend into higher sensitivity areas, but these can be specifically managed. The layout provided includes only road and turbine positions, not final design. The final design will include the actual footprint and it can be undertaken in such a manner that loss can be minimised (for example, where a turbine position (i.e. the point on the map) falls on the edge of or slightly within an elevated sensitivity area, the actual hard stand area can be aligned so that as much as possibly falls outside of the 'sensitive' area. Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context).
EMVELO MTPA	

2.1. Sensitive Habitats *Intact Grassland Patches* Intact grassland patches allow species to thrive and to support species that may need to move in response to climate change, enabling the normal functioning of natural ecological processes such as fire regimes or pollination. These patches are typically larger than 100 ha, with little or no gaps and minimal edge effects, and occur in close proximity to other intact grassland patches. They function as "source areas" in metapopulation dynamics where birth rates exceed death rates. No significant impacts should be allowed that would change a source area into a sink area (where death rates exceed birth rates). Mpumalanga has only 1,039 intact grassland patches, covering 15% of the province. These areas have been prioritised for their connectivity importance and must be avoided by wind energy facilities. The intact patches on Emvelo are critical for maintaining connectivity with other grasslands. Despite MTPA raising concerns, specialist reports were largely silent on their importance. Using over 80,000 bird observations, the MTPA confirmed that intact grasslands have a 22% higher likelihood of hosting birds of conservation concern, 49% more birds of conservation concern, and 98% more individual bird observations than non-intact grasslands. These patches make up 23% of the Emvelo WEF footprint, and six turbines (13, 19, 20, 22, 23, and 25) are located within them. These turbines should be removed. The MTPA feels strongly that the establishment of wind farms in intact grassland patches should not be allowed as it may turn a "source" area into a "sink" area. Even Pages 3 and 4 of the Faunal assessment within the DEIA recognises that "*Faunal integrity relies on inter-connected grassland habitats across landscapes*." and "…*any contiguous areas of intact grassland are considered as high conservation importance*." *Climate Change Corridors* The MBSP's climate change corridor network was designed to enable species and ecosystems to adapt to a changing environment. The corridor network considered a single-best (least-cost) corridor connecting up the climate change refugia with the climate change corridors from adjacent provinces. Additional fine-scale corridors were then identified using Circuitscape, finding alternative pathways and identifying pinch points in the corridors and thereby building resilience into the corridor network. As can be seen from Figure 2, climate change corridor runs predominantly north-south through the project area, linking the climate change focal areas (as well as coincidentally the Grassland IBA with the Chrissies Pans IBA). Given that large birds do not fly in narrow, predictable lines, a flight corridor would need to be functionally broader than the MTPA provided fine-scale corridor. A broader macro-scaled corridor would be required for	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings. The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).

avifauna to ensure safe passage along the corridors. Maintaining this linkage is essential for long-term ecological resilience under climate change. The following turbines are within 500m of the climate change corridors and should be removed: 1, 4, 5, 7, and 25, as they would compromise this corridor. The risk from the proposed wind farm on the corridor network is that the wind farm is unfortunately located along an important north-south macro regional flyway/corridor (also supported by vulture tracking data, Figure 9) which will result in increased collisions and electrocution, and habitat displacement. It stands to disrupt movement along the corridor and result in increased mortalities. *National Protected Area Expansion Strategy (NPAES 2018)* Over 70% of the proposed WEF falls within NPAES spatial priority areas, with 25% of turbines directly on focal areas. These sites are nationally significant for conservation expansion. Currently, seven turbines (13, 14, 19, 20, 22, 23, and 25) are located in NPAES zones and should be removed.	
2.3 Specialist Assessments – other The MTPA has significant reservations regarding the Terrestrial Assessment. Key concerns include: • The terrestrial biodiversity theme is still not aligned with SANBI's Species Environmental Assessment Guideline (2022) that the consultant is required to comply with in terms of Notice 1150 of Government Gazette 43855 of 2020. • The author only allowed for 4 days to survey both the Sheepmoor and Emvelo WEF sites during the summer months, when most summer rainfall plants would be flowering and identifiable. Four days is certainly not enough to cover an area this size (12,543 ha for both WEFs). This report is the same report as submitted with previous DEIA. • No plant species of conservation concern, or endemics, were recorded on site. This is not surprising given the lack of time to survey this large area. ERM also opted to appoint a botanist not familiar with the flora of this area. There are several endemics restricted to this area that would be unfamiliar to someone not from the area. It just makes it harder to confirm identification, particularly with limited time and coverage in the field. The MTPA is confident that several species of conservation concern would occur on site; they were just not detected. • The failure to apply the SANBI Guidelines resulted in inadequate time being allowed to properly assess the terrestrial biodiversity (botany) and the determining of site ecological importance (SEI). The consultant did not follow the SEI methodology, as required in terms of the SANBI guidelines and the MTPA does not believe that the	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings. The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).

approach followed to identify sensitive areas would be able to adequately assess the environmental sensitivity for this area. There were a number of additional variables that could have been applied (site-specific species, CBAs and ESAs, climate change corridors, intact grasslands, rocky ridges, etc.), patch size, together with criteria and approach of that are required in the SANBI Species Environmental Assessment Guidelines. • The approach followed resulted in some CBA Irreplaceable areas, that overlapped with intact grasslands and provincial climate change corridors, being designated medium sensitivity (as a maximum value because it did not ultimately fall within the Eastern Highveld Grassland). This is fundamentally wrong as there was no consideration for any species of conservation concern (like roosting areas) or other spatial priorities like CBAs to meet biodiversity targets. Applying the SANBI criteria could allow the montane grassland to be categorised as *high*, or even *very high* if species and additional data were considered. • In terms of the terrestrial biodiversity assessment, the result is that the montane grassland (not degraded) is of *medium* sensitivity, but the degraded Highveld grassland has *high* sensitivity, and non-degraded a *very-high* sensitivity. This does not make sense. We have significantly more threatened plant species recorded in the Wakkerstroom Montane Grassland than for the Eastern Highveld Grassland and consider far more sensitive. • Ultimately, the MTPA does not agree with the vegetation sensitivity analysis that then fed into other planning processes, such as the offsets, as it did not apply SANBI's Species Environmental Assessment Guideline (2022).	
3. Summary of Turbine Locations requiring reconsideration Should DFFE proceed towards authorisation, we strongly recommend the exclusion of the turbines identified in below.	Refer to separate table. The comments are not giving consideration to the ground truthed findings (for example where it is designated CBA as per MBSP, but in fact it's in the middle of a mielie field).
SHEEPMOOR MTPA	
2.1. Sensitive Habitats *Intact Grassland Patches* Intact grassland patches allow species to thrive and to support species that may need to move in response to climate change, enabling the normal functioning of natural ecological processes such as fire regimes or pollination. These patches are typically larger than 100 ha, with little or no gaps and minimal edge effects, and occur in close proximity to other intact grassland patches. They function as "source areas" in metapopulation dynamics where birth rates exceed death rates. No significant impacts should be allowed that would change a source area into a sink area (where death rates exceed birth rates). Mpumalanga	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings.

has only 1,039 intact grassland patches, covering 15% of the province. These areas have been prioritised for their connectivity importance and must be avoided by wind energy facilities. The intact patches on Sheepmoor are critical for maintaining connectivity with other grasslands. Despite MTPA raising concerns, specialist reports were largely silent on their importance. Using over 80,000 bird observations, the MTPA confirmed that intact grasslands have a 22% higher likelihood of hosting birds of conservation concern, 49% more birds of conservation concern, and 98% more individual bird observations than non-intact grasslands. These patches make up 23% of the Sheepmoor WEF footprint, and eight turbines (26, 27, 28, 29, 31, 32, 33, and 43) are located within them. These turbines should be removed. See Figure 1. Therefore, the MTPA feels stronger than ever that the establishment of wind farms in intact grassland patches should not be allowed as it may turn a "source" area into a "sink" area. Even Page 3 and 4 of the Faunal assessment within the DEIA recognises that "Faunal integrity relies on inter-connected grassland habitats across landscapes." and "…any contiguous areas of intact grassland are considered as high conservation importance.". *Climate Change Corridors* The MBSP's climate change corridor network was designed to enable species and ecosystems to adapt to a changing environment. The corridor network considered a single-best (least-cost) corridor connecting up the climate change refugia with the climate change corridors from adjacent provinces. Additional fine-scale corridors were then identified using Circuitscape, finding alternative pathways and identifying pinch points in the corridors and thereby building resilience into the corridor network. We have significantly more threatened plant species recorded in the Wakkerstroom Montane Grassland than for the Eastern Highveld Grassland and consider far more sensitive. • Ultimately, the MTPA does not agree with the vegetation sensitivity analysis that then fed into other planning processes, such as the offsets, as it did not apply SANBI's Species Environmental Assessment Guideline (2022).	
3. Summary of Turbine Locations requiring reconsideration Should DFFE proceed towards authorisation, we strongly recommend the exclusion of the turbines identified in below.	Refer to separate table. The comments are not giving consideration to the ground truthed findings (for example where it is designated CBA as per MBSP, but in fact it's in the middle of a mielie field).

WTG POSITION COMMENTS

Emvelo	
WTG in question	Area ground truthed to be.
WTG 3	Cleared Invaded: Low sensitivity, moderately modified. WTG within mielie field, ion edge of remnant grassland pocket. Final design can avoid the more sensitive area.
WTG 5	Transformed: Low sensitivity. WTG within mielie field, on edge of remnant grassland pocket. Final design can avoid the more sensitive area.
WTG 7	Transformed: Low sensitivity. WTG within mielie field, on edge of remnant grassland pocket. Final design can avoid the more sensitive area.
WTG 11	Plantation/invaded: Low sensitivity. This is a densely invaded area, transformed or significantly degraded (i.e. natural ecological processes are significantly altered, including the soil (due to impact of dense invasion plus historical hot fires). Final design can avoid the more sensitive areas.
WTG 13	Other Natural Area: Montane Grassland, Moderate sensitivity.
WTG 14	CBA Optimal: Montane Grassland, Moderate sensitivity. WTG on edge of densely invaded area, transformed or significantly degraded (i.e. natural ecological processes are significantly altered, including the soil (due to impact of dense invasion plus historical hot fires). Final design can avoid the more sensitive areas.

WTG 15	Transformed: Low sensitivity. WTG on edge of cultivated area, on edge of remnant grassland pocket. Final design can avoid the more sensitive area.
WTG 18	Plantation/invaded: Low sensitivity, heavily modified. WTG on edge of densely invaded area, transformed or significantly degraded (i.e. natural ecological processes are significantly altered, including the soil (due to impact of dense invasion plus historical hot fires). . Final design can avoid the more sensitive areas.
WTG 19	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP.
WTG 20	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP.
WTG 21	Plantation/invaded: Low sensitivity, heavily modified. WTG on edge of densely invaded area, transformed or significantly degraded (i.e. natural ecological processes are significantly altered, including the soil (due to impact of dense invasion plus historical hot fires). . Final design can avoid the more sensitive areas.
WTG 22	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 23	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 25	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
Sheepmoor	
WTG in question	Area ground truthed to be.
WTG 26	Other Natural Area, Moderate sensitivity: Montane Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 27	Other Natural Area, Moderate sensitivity: Montane Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 28	Other Natural Area, Moderate sensitivity: Montane Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 29	Other Natural Area, Moderate sensitivity: Montane Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 30	Heavily modified, low sensitivity: Cleared Invaded. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.
WTG 31	Ecological Support Area, Moderate sensitivity: Montane Grassland. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 32	Other Natural Areas, low sensitivity: Plantation/Invaded. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.
WTG 33	Ecological Support Area, Moderate sensitivity: Montane Grassland. The site is designated ECOLOGICAL SUPPORT AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 36	Plantation/Invaded: Low sensitivity. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.

WTG 37	Plantation/Invaded: Low sensitivity, heavily modified. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.
WTG 38	Other Natural Area: Highveld Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 43	Ecological Support Area: Montane Grassland, Moderate sensitivity. The site is designated ECOLOGICAL SUPPORT AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 44	Ecological Support Area: Montane Grassland, Moderate sensitivity, along a road. The site is designated ECOLOGICAL SUPPORT AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 45	Transformed: Low sensitivity. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.
WTG 46	Heavily modified: Highveld Grassland. WTG position is on the edge of intact vegetation and transformed area. WEF laydown footprint can thus be aligned to minimise this substantially.
WTG 52	Ecological Support Area: Montane Grassland, Moderate sensitivity. The site is designated ECOLOGICAL SUPPORT AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 53	Heavily modified: Highveld Grassland. WTG position is on the edge of intact vegetation and transformed area. WEF laydown footprint can thus be aligned to minimise this substantially.

TERRESTRIAL BIODIVERSITY: COMMENTS & RESPONSES: FINAL EIR (2025/08/20)

COMMENT	RESPONSE
EMVELO DARDLEA	
2. The proposed Emvelo Wind Energy Facility and associated grid infrastructure is located on a site comprising: CSA Irreplaceable and Optimal; Intact Grassland Patches; Key Biodiversity Areas; the Grasslands Important Bird Area (IBA); Ecological Support Areas; National Protected Area Expansion Strategy Areas (NPAES); Threatened Ecosystems - including Wakkerstroom Montane Grassland and Eastern Highveld Grassland; CSA: Aquatic Rivers; ESA: Strategic Water Source Area; ESA: Wetlands and ESA: Important Sub-catchments.	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked.
5. DARDLEA is not supportive of development of WEFs (or any non-compatible land use) within Critical Biodiversity Areas and Key Biodiversity Areas, or within intact grassland patches. In respect of Intact Grassland Patches, it is important to note that the Mpumalanga Biodiversity Sector Plan (MBSP) specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened fauna and avifauna. This is verified in the fauna! assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area". Intact Grassland Patches are important source areas in terms of metapopulation dynamics. The MBSP - adopted in 2023 (Provincial Notice 279 of 2023) - is a planning tool that has been developed to manage biodiversity resources of the province by setting strategic objectives to ensure that spatial biodiversity and climate change priorities are effectively incorporated into land-use and development planning, environmental assessments and authorisations, and natural resource management within Mpumalanga Province. The links to the various reports and shape files, including the MBSP Technical Report which details the scientific methods used to identify Intact Grassland Patches, can be accessed at https://mtpa. maps. ArcGIS. com/sharing/rest/content/items/fc6d8f9e 7 ef84d2f87f86b91 e8e9f87 *a*/data).	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings. The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).
11. The number of turbines that are located in areas recommended for avoidance (at least 16 out of 22), and the location of the roads, construction camps and OHLs in sensitive areas demonstrates that the site is not compatible with the proposed land use. The areas of concern as they relate to the abovementioned comments, are outlined below:	Refer to separate table. The comments are not giving consideration to the ground truthed findings (for example where it is designated CBA as per MBSP, but in fact it's in the middle of a mielie field).

14. The Terrestrial Assessment (inclusive of Plant Species) did not apply the Site Ecological Importance (SEI) methodology, which is a requirement of the Species Environmental Assessment Guideline. The Species Protocols specifically stipulate that assessments "must be undertaken in accordance with the *Species Environmental Assessment Guideline*" (South African National Biodiversity Institute, 2020. Species Environmental Assessment Guideline. Guidelines for the implementation of the Terrestrial Fauna and Terrestrial Flora Species Protocols for environmental impact assessments in South Africa. South African National Biodiversity Institute, Pretoria). Non-compliance with the *Species Environmental Assessment Guideline* has resulted in the following deficiencies: 14.1. Insufficient time was allocated to surveying in the appropriate season (only 4 days for both Sheepmoor and Emvelo WEF sites, as well as the Grid sites). 14.2. The classification of the Montane Grassland on site as "moderate sensitivity" in the absence of applying all relevant criteria, including *inter alia,* conservation importance, functional integrity, receptor resilience, as well as species of conservation concern, spatial priorities, intact grassland patches, and CBAs. 14.1. The montane ridge (where WTGs 13, 19, 20, 22, 23 and 25, along with grid infrastructure are proposed), which also coincides with intact grassland and the highest sensitivity for Fauna (according to the Faunal Assessment), being classified as "moderate sensitivity". (Noting further that according to the Fauna Assessment, "the high sensitive escarpment area is likely of general importance for a range of faunal groups, representative of a large contiguous and ecologically intact area of mostly good-quality montane grassland". If the correct and required criteria are applied, the classification of this area is more likely to be classified as "High" or "Very High Sensitivity".	Incorrect deduction regarding number of days on site – refer to clear outline of dates provided under site visit in Terrestrial Biodiversity Assessment Report, which was more than 4 days across two seasonal visits. This was clarified in the draft comments and responses but is still being incorrectly stated in the MPTA comments as being 4 days only. The MPTA correctly states that 4 days is inadequate, <u>which is why 10 days were spent on site</u>. A preliminary overview site visit was conducted on 18 April 2023 (late autumn/early winter) for the purposes of a high-level reconnaissance of the site, followed by a further site visit between 19 & 22 June 2023 (winter) in order to undertake the preliminary screening, site sensitivity mapping and survey. A final comprehensive site visit and survey was undertaken between 09 & 13 December 2024, which constituted the summer seasonal site visit and assessment and also served to inform final layout design. This constitutes a sampling period of 10 days, which was deemed to be adequate for such an assessment. The blanket designation of an entire vegetation unit based on species that might be represented locally within that vegetation unit, would be incorrect. If the species represented were to inhabit the entire vegetation unit, then it is likely that they would not be considered to have an elevated conservation status, as they would be common.
15. As a result of the deficiencies in the Terrestrial Assessment outlined above, we have low confidence in the associated impact analysis, and dispute the Specialist's "low" significance ratings.	This project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The overall impact is thus low.
18. Biodiversity Offset Strategy: 18.1. According to the Biodiversity Offset Guideline, *"The desired outcome of biodiversity offsets is to ensure that - the cumulative impact of an authorised activity, or activities, and land and resource use change does not: result in the loss of irreplaceable biodiversity or jeopardise the ability to meet biodiversity targets; lead to any ecosystem with a threat status of Vulnerable or Least Concern becoming Endangered; or any Endangered ecosystem becoming Critically Endangered; or cause an irreversible decline in the conservation status of species and the presence of special habitats: or cause a significant loss in ecosystem services".* A biodiversity offset cannot therefore cater for the loss of Irreplaceable CBAs or intact	The layout has sought to avoid the most sensitive areas and prioritise lower sensitivity areas. In order for the project to be feasible some footprints may extend into higher sensitivity areas, but these can be specifically managed. The layout provided includes only road and turbine positions, not final design. The final design will include the actual footprint and it can be undertekn in such a manner that loss can be minimised (for example, where a turbine position (i.e. the point on the map) falls on the edge of or slightly within an elevated

grasslands. As detailed in the comments above, intact grasslands are crucial for supporting threatened fauna and avifauna. 18.2. The Biodiversity Offset Guideline specifically states that "biodiversity offsets are not appropriate when an activity, or activities, will have residual impacts on biodiversity of very high significance, including when residual negative impacts will result in loss of irreplaceable biodiversity". 18.3. In addition to Irreplaceable CBAs, the Biodiversity Offset Guideline also categorises the following as "irreplaceable biodiversity": Biodiversity of major potential concern, where residual impacts in this category could lead to - loss of vulnerable or potentially irreplaceable biodiversity in areas of recognised importance, such as - areas evaluated as having High Ecological Site Importance. We maintain that the correct and required implementation of the Species Environmental Assessment Guideline would have resulted in the Montane Grassland being classified as having High Ecological Site Importance. 18.4. The Intact Grassland Patches on the site must therefore be avoided, and cannot be offset. The requirement to consider biodiversity offsets is applicable only once it has been demonstrated that all measures of avoidance have been exhausted. The loss of irreplaceable biodiversity cannot be offset, and, as outlined above, "irreplaceable biodiversity" includes, key ecological corridors recognized as important for evolutionary processes and climate change adaptation where no options to safeguard these processes exist. 18.5. Furthermore, the Biodiversity Offset Report does not meet the following minimum requirements: i. A portfolio of candidate biodiversity offset sites, including the likelihood of each site's availability and feasibility. ii. The required biodiversity outcomes on each of the candidate biodiversity offset sites.	sensitivity area, the actual hard stand area can be aligned so that as much as possibly falls outside of the 'sensitive' area. Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context).
19. Cumulative Impact Assessment: 19.1. In our comments dated 10 April 2025 on your original draft EIA, despite bringing another 5 approved and in-process WEFs (within a 35 km radius) to your attention (i.e. Zephyr, Ujekamanzi Ntabande and Daggafoort and Emvelo), your revised cumulative impact assessment once again fails to mention or assess these. Subsequently, there are now an additional 3 WEFs within 35 km that are now in-process, i.e. Leghoya WEF 1, 2 & 3, and another one (1) within a 55 km radius (i.e. Anemoi WEF). 19.2. Furthermore, although section 4.3.3 states that "the scope of this assessment will include all operational, approved or current and planned renewable energy applications", in addition to the approved or in-process WEFs identified in 17 .1. above (not included in this assessment), there are actually an additional two (2) WEFs within 35 km and a further	Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context). The comment is again quoting the total project area rather than the actual WEF footprint of the projects included in the calculation. Only a small proportion of the grassland will be transformed (i.e. the

two (2) proposed WEFs (i.e. Pre-Application) within a 55 km radius, that have not been identified. The total number of turbines within 35 km is more than double that indicated in both the Draft EIA and Revised Draft EIA reports, i.e. 435 (and not 192) and within a 55 km radius there are more than 663 turbines (approved, in-process and proposed). As a minimum, the cumulative impact of approved and in-process applications must be assessed. 19.3. Avifauna 19.4. Fauna 19.5. DFFE also requires that "the cumulative impact assessment for all identified and assessed impacts must indicate the following: (a) Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e. hectares of cumulatively transformed land". The Revised EIA Report does again not accurately quantify the size of the identified impacts, i.e. hectares of cumulatively transformed land. The overall footprint size of this, and all other similar proposed and approved renewable energy facilities within a 35 km radius is now 178 017.24 ha (Approved: 31 440.17 ha, In Progress: 89 247.96 ha, Pre-Application: 57 329.11 ha). Again, as a minimum, the cumulative impact of approved and in-process applications must be assessed. 19.6. Avifauna	actual road, WEF and other infrastructure footprint. The grassland that is retained will still function.
SHEEPMOOR DARDLEA	
3. The proposed Sheepmoor Wind Energy Facility and associated grid infrastructure is located on a site comprising: CBA Irreplaceable and Optimal; Intact Grassland Patches; Key Biodiversity Areas; the Grasslands Important Bird Area (IBA); Ecological Support Areas; National Protected Area Expansion Strategy Areas (NPAES); Local-scale and Landscape-scale Climate Change Corridors; Threatened Ecosystems - including Wakkerstroom Montane Grassland and Eastern Highveld Grassland; CBA: Wetlands; CBA: Aquatic Rivers; ESA: Strategic Water Source Area and ESA: Important Sub-catchments.	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked.
6. DARDLEA is not supportive of development of WEFs (or any non-compatible land use) within Critical Biodiversity Areas and Key Biodiversity Areas, or within intact grassland patches. In respect of Intact Grassland Patches, it is important to note that the Mpumalanga Biodiversity Sector Plan (MBSP) specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened fauna and avifauna. This is verified in the fauna! assessment which states that "any remaining Oribi sub-populations and any contiguous areas of intact grassland are considered as high	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings.

conservation importance" and that "cumulative impacts may become more significant if added to existing or future impacts from other activities, such as other renewable energy projects in the area". Intact Grassland Patches are important source areas in terms of metapopulation dynamics. The MBSP - adopted in 2023 (Provincial Notice 279 of 2023) - is a planning tool that has been developed to manage biodiversity resources of the province by setting strategic objectives to ensure that spatial biodiversity and climate change priorities are effectively incorporated into land-use and development planning, environmental assessments and authorisations, and natural resource management within Mpumalanga Province. The links to the various reports and shape files, including the MBSP Technical Report which details the scientific methods used to identify Intact Grassland Patches, can be accessed at https://mtpa. maps. arcgis. com/sharing/rest/content/items/fc6d8f9e 7 ef84d2f87f86b91 e8e9f87 *a*/data).	The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).
12. The number of turbines that are located in areas recommended for avoidance (at least 17 out of 25), and the location of the O&M building, roads and OH Ls in sensitive areas demonstrates that the site is not compatible with the proposed land use. The areas of concern as they relate to the abovementioned comments, are outlined below:	Refer to separate table. The comments are not giving consideration to the ground truthed findings (for example where it is designated CBA as per MBSP, but in fact it's in the middle of a mielie field).
14. The Terrestrial Assessment (inclusive of Plant Species), did not apply the Site Ecological Importance (SEI) methodology, which is a requirement of the Species Environmental Assessment Guideline. The Species Protocols specifically stipulate that assessments "must be undertaken in accordance with the *Species Environmental Assessment Guideline"* (South African National Biodiversity Institute, 2020. Species Environmental Assessment Guideline. Guidelines for the implementation of the Terrestrial Fauna and Terrestrial Flora Species Protocols for environmental impact assessments in South Africa. South African National Biodiversity Institute, Pretoria). Non-compliance with the *Species Environmental Assessment Guideline* has resulted in the following deficiencies: 14.1. Insufficient time was allocated to surveying in the appropriate season (only 4 days for both Sheepmoor and Emvelo WEF sites, as well as the Grid sites). 14.2. The classification of the Montane Grassland on site as "moderate sensitivity" in the absence of applying all relevant criteria, including *inter alia,* conservation importance, functional integrity, receptor resilience, as well as species of conservation concern, spatial priorities, intact grassland patches, and CBAs. 14.1. The montane ridge (where WTGs 26, 27, 28, 29, 30 and 33, along with grid infrastructure are proposed), which also coincides with intact grassland and the highest sensitivity for Fauna (according to the Fauna! Assessment), being classified as "moderate sensitivity". (Noting further that according to the Fauna Assessment, "the high sensitive escarpment area is likely of general importance for a range of fauna! groups,	Incorrect deduction regarding number of days on site – refer to clear outline of dates provided under site visit in Terrestrial Biodiversity Assessment Report, which was more than 4 days across two seasonal visits. This was clarified in the draft comments and responses but is still being incorrectly stated in the MPTA comments as being 4 days only. The MPTA correctly states that 4 days is inadequate, <u>which is why 10 days were spent on site</u>. A preliminary overview site visit was conducted on 18 April 2023 (late autumn/early winter) for the purposes of a high-level reconnaissance of the site, followed by a further site visit between 19 & 22 June 2023 (winter) in order to undertake the preliminary screening, site sensitivity mapping and survey. A final comprehensive site visit and survey was undertaken between 09 & 13 December 2024, which constituted the summer seasonal site visit and assessment and also served to inform final layout design. This constitutes a sampling period of 10 days, which was deemed to be adequate for such an assessment. The blanket designation of an entire vegetation unit based on species that might be represented locally within that vegetation unit, would be incorrect. If the species represented were to inhabit the entire

representative of a large contiguous and ecologically intact area of mostly good-quality montane grassland".	vegetation unit, then it is likely that they would not be considered to have an elevated conservation status, as they would be common.
15. As a result of the deficiencies in the Terrestrial Assessment outlined above, we have low confidence in the associated impact analysis, and dispute the Specialist's "low" significance ratings.	This project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The overall impact is thus low.
17. Cumulative Impact Assessment: 17.1. In our comments dated 10 April 2025 on your original draft EIA, despite bringing another 5 approved and in-process WEFs (within a 35 km radius) to your attention (i.e. Zephyr, Ujekamanzi Ntabande and Daggafoort and Emvelo), your revised cumulative impact assessment once again fails to mention or assess these. Subsequently, there are now an additional 3 WEFs within 35 km that are now in-process, i.e. Leghoya WEF 1, 2 & 3, and another one (1) within a 55 km radius (i.e. Anemoi WEF). 17.2. Furthermore, although section 4.3.3 states that "the scope of this assessment will include all operational, approved or current and planned renewable energy applications", in addition to the approved or in-process WEFs identified in 17 .1. above (not included in this assessment), there are actually an additional two (2) WEFs within 35 km and a further two (2) proposed WEFs (i.e. Pre-Application) within a 55 km radius, that have not been identified. The total number of turbines within 35 km is more than double that indicated in both the Draft EIA and Revised Draft EIA reports, i.e. 435 (and not 192) and within a 55 km radius there are more than 663 turbines (approved, in-process and proposed). As a minimum, the cumulative impact of approved and in-process applications must be assessed. 17.3. Avifauna 17.4. Fauna 17.5. DFFE also requires that "the cumulative impact assessment for all identified and assessed impacts must indicate the following: (a) Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e. hectares of cumulatively transformed land". The Revised EIA Report does again not accurately quantify the size of the identified impacts, i.e. hectares of cumulatively transformed land. The overall footprint size of this, and all other similar proposed and approved renewable energy facilities within a 35 km radius is now 178 017.24 ha (Approved: 31 440.17 ha, In Progress: 89 247.96 ha, Pre-Application: 57 329.11 ha). Again, as a minimum, the cumulative impact of approved and in-process applications must be assessed. 17.6. Avifauna	Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context). The comment is again quoting the total project area rather than the actual WEF footprint of the projects included in the calculation. Only a small proportion of the grassland will be transformed (i.e. the actual road, WEF and other infrastructure footprint. The grassland that is retained will still function. The layout has sought to avoid the most sensitive areas and prioritise lower sensitivity areas. In order for the project to be feasible some footprints may extend into higher sensitivity areas, but these can be specifically managed. The layout provided includes only road and turbine positions, not final design. The final design will include the actual footprint and it can be undertekn in such a manner that loss can be minimised (for example, where a turbine position (i.e. the point on the map) falls on the edge of or slightly within an elevated sensitivity area, the actual hard stand area can be aligned so that as much as possibly falls outside of the 'sensitive' area. Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context).

19. Biodiversity Offset Strategy: According to the Biodiversity Offset Guideline, *"The desired outcome of biodiversity offsets is to ensure that - the cumulative impact of an authorised activity, or activities, and land and resource use change does not: result in the loss of irreplaceable biodiversity or jeopardise the ability to meet biodiversity targets; lead to any ecosystem with a threat status of Vulnerable or Least Concern becoming Endangered; or any Endangered ecosystem becoming Critically Endangered; or cause an irreversible decline in the conservation status of species and the presence of special habitats; or cause a significant loss in ecosystem services".* A biodiversity offset cannot therefore cater for the loss of Irreplaceable CBAs or intact grasslands. As detailed in the comments above, intact grasslands are crucial for supporting threatened fauna and avifauna. 19.2. The Biodiversity Offset Guideline specifically states that "biodiversity offsets are not appropriate when an activity, or activities, will have residual impacts on biodiversity of very high significance, including when residual negative impacts will result in loss of irreplaceable biodiversity". 19.3. In addition to Irreplaceable CBAs, the Biodiversity Offset Guideline also categorises the following as "irreplaceable biodiversity": Biodiversity of major potential concern, where residual impacts in this category could lead to - loss of vulnerable or potentially irreplaceable biodiversity in areas of recognised importance, such as - areas evaluated as having High Ecological Site Importance. We maintain that the correct and required implementation of the Species Environmental Assessment Guideline would have resulted in the Montane Grassland being classified as having High Ecological Site Importance. 19.4. The Intact Grassland Patches on the site must therefore be avoided, and cannot be offset. The requirement to consider biodiversity offsets is applicable only once it has been demonstrated that all measures of avoidance have been exhausted. The loss of irreplaceable biodiversity cannot be offset, and, as outlined above, "irreplaceable biodiversity" includes, key ecological corridors recognized as important for evolutionary processes and climate change adaptation where no options to safeguard these processes exist. 19.5. Furthermore, the Biodiversity Offset Report does not meet the following minimum requirements: i. A portfolio of candidate biodiversity offset sites, including the likelihood of each site's availability and feasibility. ii. The required biodiversity outcomes on each of the candidate biodiversity offset sites.	The layout has sought to avoid the most sensitive areas and prioritise lower sensitivity areas. In order for the project to be feasible some footprints may extend into higher sensitivity areas, but these can be specifically managed. The layout provided includes only road and turbine positions, not final design. The final design will include the actual footprint and it can be undertekn in such a manner that loss can be minimised (for example, where a turbine position (i.e. the point on the map) falls on the edge of or slightly within an elevated sensitivity area, the actual hard stand area can be aligned so that as much as possibly falls outside of the 'sensitive' area. Again, this project is a Wind Energy Facility, which includes access roads and small localised footprint. It is not an agricultural or mining project that would result in vast areas being transformed (i.e. thousands of hectares). The assumptions being made in the comments are assuming that there is going to be transformation of vast areas of grassland (such as would occur in a mining or agricultural context).
EMVELO MTPA	

2.1. Sensitive Habitats ***Intact Grassland Patches*** Intact grassland patches allow species to thrive and to support species that may need to move in response to climate change, enabling the normal functioning of natural ecological processes such as fire regimes or pollination. These patches are typically larger than 100 ha, with little or no gaps and minimal edge effects, and occur in close proximity to other intact grassland patches. They function as "source areas" in metapopulation dynamics where birth rates exceed death rates. No significant impacts should be allowed that would change a source area into a sink area (where death rates exceed birth rates). Mpumalanga has only 1,039 intact grassland patches, covering 15% of the province. These areas have been prioritised for their connectivity importance and must be avoided by wind energy facilities. The intact patches on Emvelo are critical for maintaining connectivity with other grasslands. Despite MTPA raising concerns, specialist reports were largely silent on their importance. Using over 80,000 bird observations, the MTPA confirmed that intact grasslands have a 22% higher likelihood of hosting birds of conservation concern, 49% more birds of conservation concern, and 98% more individual bird observations than non-intact grasslands. These patches make up 23% of the Emvelo WEF footprint, and six turbines (13, 19, 20, 22, 23, and 25) are located within them. These turbines should be removed. The MTPA feels strongly that the establishment of wind farms in intact grassland patches should not be allowed as it may turn a "source" area into a "sink" area. Even Pages 3 and 4 of the Faunal assessment within the DEIA recognises that "*Faunal integrity relies on inter-connected grassland habitats across landscapes*." and "*… any contiguous areas of intact grassland are considered as high conservation importance*." ***Climate Change Corridors*** The MBSP's climate change corridor network was designed to enable species and ecosystems to adapt to a changing environment. The corridor network considered a single-best (least-cost) corridor connecting up the climate change refugia with the climate change corridors from adjacent provinces. Additional fine-scale corridors were then identified using Circuitscape, finding alternative pathways and identifying pinch points in the corridors and thereby building resilience into the corridor network. As can be seen from Figure 2, climate change corridor runs predominantly north-south through the project area, linking the climate change focal areas (as well as coincidentally the Grassland IBA with the Chrissies Pans IBA). Given that large birds do not fly in narrow, predictable lines, a flight corridor would need to be functionally broader than the MTPA provided fine-scale corridor. A broader macro-scaled corridor would be required for	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings. The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).

avifauna to ensure safe passage along the corridors. Maintaining this linkage is essential for long-term ecological resilience under climate change. The following turbines are within 500m of the climate change corridors and should be removed: 1, 4, 5, 7, and 25, as they would compromise this corridor. The risk from the proposed wind farm on the corridor network is that the wind farm is unfortunately located along an important north-south macro regional flyway/corridor (also supported by vulture tracking data, Figure 9) which will result in increased collisions and electrocution, and habitat displacement. It stands to disrupt movement along the corridor and result in increased mortalities. *National Protected Area Expansion Strategy (NPAES 2018)* Over 70% of the proposed WEF falls within NPAES spatial priority areas, with 25% of turbines directly on focal areas. These sites are nationally significant for conservation expansion. Currently, seven turbines (13, 14, 19, 20, 22, 23, and 25) are located in NPAES zones and should be removed.	
2.3 Specialist Assessments – other The MTPA has significant reservations regarding the Terrestrial Assessment. Key concerns include: • The terrestrial biodiversity theme is still not aligned with SANBI's Species Environmental Assessment Guideline (2022) that the consultant is required to comply with in terms of Notice 1150 of Government Gazette 43855 of 2020. • The author only allowed for 4 days to survey both the Sheepmoor and Emvelo WEF sites during the summer months, when most summer rainfall plants would be flowering and identifiable. Four days is certainly not enough to cover an area this size (12,543 ha for both WEFs). This report is the same report as submitted with previous DEIA. • No plant species of conservation concern, or endemics, were recorded on site. This is not surprising given the lack of time to survey this large area. ERM also opted to appoint a botanist not familiar with the flora of this area. There are several endemics restricted to this area that would be unfamiliar to someone not from the area. It just makes it harder to confirm identification, particularly with limited time and coverage in the field. **The MTPA is confident that several species of conservation concern would occur on site; they were just not detected**. • The failure to apply the SANBI Guidelines resulted in inadequate time being allowed to properly assess the terrestrial biodiversity (botany) and the determining of site ecological importance (SEI). The consultant did not follow the SEI methodology, as required in terms of the SANBI guidelines and the MTPA does not believe that the	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings. The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).

approach followed to identify sensitive areas would be able to adequately assess the environmental sensitivity for this area. There were a number of additional variables that could have been applied (site-specific species, CBAs and ESAs, climate change corridors, intact grasslands, rocky ridges, etc.), patch size, together with criteria and approach of that are required in the SANBI Species Environmental Assessment Guidelines. • The approach followed resulted in some CBA Irreplaceable areas, that overlapped with intact grasslands and provincial climate change corridors, being designated **medium** sensitivity (as a maximum value because it did not ultimately fall within the Eastern Highveld Grassland). This is fundamentally wrong as there was no consideration for any species of conservation concern (like roosting areas) or other spatial priorities like CBAs to meet biodiversity targets. Applying the SANBI criteria could allow the montane grassland to be categorised as *high*, or even *very high* if species and additional data were considered. • In terms of the terrestrial biodiversity assessment, the result is that the montane grassland (not degraded) is of *medium* sensitivity, but the degraded Highveld grassland has *high* sensitivity, and non-degraded a *very-high* sensitivity. This does not make sense. We have significantly more threatened plant species recorded in the Wakkerstroom Montane Grassland than for the Eastern Highveld Grassland and consider far more sensitive. • Ultimately, the MTPA does not agree with the vegetation sensitivity analysis that then fed into other planning processes, such as the offsets, as it did not apply SANBI's Species Environmental Assessment Guideline (2022).	
3. Summary of Turbine Locations requiring reconsideration Should DFFE proceed towards authorisation, we strongly recommend the exclusion of the turbines identified in below.	Refer to separate table. The comments are not giving consideration to the ground truthed findings (for example where it is designated CBA as per MBSP, but in fact it's in the middle of a mielie field).
SHEEPMOOR MTPA	
2.1. Sensitive Habitats ***Intact Grassland Patches*** Intact grassland patches allow species to thrive and to support species that may need to move in response to climate change, enabling the normal functioning of natural ecological processes such as fire regimes or pollination. These patches are typically larger than 100 ha, with little or no gaps and minimal edge effects, and occur in close proximity to other intact grassland patches. They function as "source areas" in metapopulation dynamics where birth rates exceed death rates. No significant impacts should be allowed that would change a source area into a sink area (where death rates exceed birth rates). Mpumalanga	The terrestrial biodiversity assessment served to refine the mapping, which is the norm, where bioregional plans are often not up to date and/or reflect inconsistencies that require ground-truthing. This was presented in the terrestrial biodiversity assessment reporting accordingly, which is being ignored by the respective authorities. This was noted in the draft EIA comments but is still being overlooked as it does not align with the agenda that serves to promote the Mpumalanga Bioregional Plan rather than acknowledge that there are shortcomings.

has only 1,039 intact grassland patches, covering 15% of the province. These areas have been prioritised for their connectivity importance and must be avoided by wind energy facilities. The intact patches on Sheepmoor are critical for maintaining connectivity with other grasslands. Despite MTPA raising concerns, specialist reports were largely silent on their importance. Using over 80,000 bird observations, the MTPA confirmed that intact grasslands have a 22% higher likelihood of hosting birds of conservation concern, 49% more birds of conservation concern, and 98% more individual bird observations than non-intact grasslands. These patches make up 23% of the Sheepmoor WEF footprint, and eight turbines (26, 27, 28, 29, 31, 32, 33, and 43) are located within them. These turbines should be removed. See Figure 1. Therefore, the MTPA feels stronger than ever that the establishment of wind farms in intact grassland patches should not be allowed as it may turn a "source" area into a "sink" area. Even Page 3 and 4 of the Faunal assessment within the DEIA recognises that "Faunal integrity relies on inter-connected grassland habitats across landscapes." and "… any contiguous areas of intact grassland are considered as high conservation importance.". ***Climate Change Corridors*** The MBSP's climate change corridor network was designed to enable species and ecosystems to adapt to a changing environment. The corridor network considered a single-best (least-cost) corridor connecting up the climate change refugia with the climate change corridors from adjacent provinces. Additional fine-scale corridors were then identified using Circuitscape, finding alternative pathways and identifying pinch points in the corridors and thereby building resilience into the corridor network. As can be seen from Figure 2, climate change corridor runs predominantly north-south through the project area, linking the climate change focal areas (as well as coincidentally the Grassland IBA with the Chrissies Pans IBA). Given that large birds do not fly in narrow, predictable lines, a flight corridor would need to be functionally broader than the MTPA provided fine-scale corridor. A broader macro-scaled corridor would be required for avifauna to ensure safe passage along the corridors. Maintaining this linkage is essential for long-term ecological resilience under climate change. The following turbines are within 500m of the climate change corridors and should be removed: 29, 31, 32, 33, 34, 36, 40, 42, 43, 44, 45, 46, 51, 52, and 53, as they would compromise this corridor. The risk from the proposed wind farm on the corridor network is that the wind farm is unfortunately located along an important north-south macro regional flyway/corridor (also supported by vulture tracking data, Figure 9) which will result in increased collisions and electrocution, and habitat displacement. It stands to disrupt movement along the corridor	The proposed project is not seeking to develop the entire intact grassland patch, only a very small footprint. The resultant loss is thus not deemed to be excessive as the area that will remain undeveloped (i.e. intact grassland) far exceeds the actual hard stand footprint of the project. Were it a mining or agricultural project that would result in the clearance of thousands of hectares of grassland the impact would be more significant. The terrestrial biodiversity impact or risks to ecological processes associated with an access road and turbine footprint would not be deemed excessive within an already modified surrounding landscape (i.e. significant agricultural and mining related land transformation).

and result in increased mortalities. ***National Protected Area Expansion Strategy (NPAES 2018)*** Over 60% of the proposed WEF falls within NPAES spatial priority areas, with 25% of turbines directly on focal areas. These sites are nationally significant for conservation expansion. Currently, 11 turbines (26, 27, 28, 29, 31, 33, 43, 44, 45, 52 and 53) are located in NPAES zones and should be removed.	
2.4 Specialist Assessments – other The MTPA has significant reservations regarding the Terrestrial Assessment. Key concerns include: • The terrestrial biodiversity theme is still not aligned with SANBI's Species Environmental Assessment Guideline (2022) that the consultant is required to comply with in terms of Notice 1150 of Government Gazette 43855 of 2020. • The author only allowed for 4 days to survey both the Sheepmoor and Emvelo WEF sites during the summer months, when most summer rainfall plants would be flowering and identifiable. Four days is certainly not enough to cover an area this size (12,543 ha for both WEFs). This report is the same report as submitted with previous DEIA. • No plant species of conservation concern, or endemics, were recorded on site. This is not surprising given the lack of time to survey this large area. ERM also opted to appoint a botanist not familiar with the flora of this area. There are several endemics restricted to this area that would be unfamiliar to someone not from the area. It just makes it harder to confirm identification, particularly with limited time and coverage in the field. **The MTPA is confident that several species of conservation concern would occur on site; they were just not detected**. • The failure to apply the SANBI Guidelines resulted in inadequate time being allowed to properly assess the terrestrial biodiversity (botany) and the determining of site ecological importance (SEI). The consultant did not follow the SEI methodology, as required in terms of the SANBI guidelines and the MTPA does not believe that the approach followed to identify sensitive areas would be able to adequately assess the environmental sensitivity for this area. 3. Summary of Turbine Locations requiring reconsideration Should DFFE proceed towards authorisation, we strongly recommend the exclusion of the turbines identified in below.	Refer to separate table. The comments are not giving consideration to the ground truthed findings (for example where it is designated CBA as per MBSP, but in fact it's in the middle of a mielie field).

WTG POSITION COMMENTS

Emvelo	
WTG in question	**Area ground truthed to be.**
WTG 3	Cleared Invaded: Low sensitivity, moderately modified. WTG within mielie field, ion edge of remnant grassland pocket. Final design can avoid the more sensitive area.
WTG 5	Transformed: Low sensitivity. WTG within mielie field, on edge of remnant grassland pocket. Final design can avoid the more sensitive area.
WTG 7	Transformed: Low sensitivity. WTG within mielie field, on edge of remnant grassland pocket. Final design can avoid the more sensitive area.
WTG 11	Plantation/invaded: Low sensitivity. This is a densely invaded area, transformed or significantly degraded (i.e. natural ecological processes are significantly altered, including the soil (due to impact of dense invasion plus historical hot fires). Final design can avoid the more sensitive areas.
WTG 13	Other Natural Area: Montane Grassland, Moderate sensitivity.
WTG 14	CBA Optimal: Montane Grassland, Moderate sensitivity. WTG on edge of densely invaded area, transformed or significantly degraded (i.e. natural ecological processes are significantly altered, including the soil (due to impact of dense invasion plus historical hot fires). . Final design can avoid the more sensitive areas.

WTG 15	Transformed: Low sensitivity. WTG on edge of cultivated area, on edge of remnant grassland pocket. Final design can avoid the more sensitive area.
WTG 18	Plantation/invaded: Low sensitivity, heavily modified. WTG on edge of densely invaded area, transformed or significantly degraded (i.e. natural ecological processes are significantly altered, including the soil (due to impact of dense invasion plus historical hot fires). . Final design can avoid the more sensitive areas.
WTG 19	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP.
WTG 20	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP.
WTG 21	Plantation/invaded: Low sensitivity, heavily modified. WTG on edge of densely invaded area, transformed or significantly degraded (i.e. natural ecological processes are significantly altered, including the soil (due to impact of dense invasion plus historical hot fires). . Final design can avoid the more sensitive areas.
WTG 22	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 23	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 25	Other Natural Area: Montane Grassland, Moderate sensitivity. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
Sheepmoor	
WTG in question	**Area ground truthed to be.**
WTG 26	Other Natural Area, Moderate sensitivity: Montane Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 27	Other Natural Area, Moderate sensitivity: Montane Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 28	Other Natural Area, Moderate sensitivity: Montane Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 29	Other Natural Area, Moderate sensitivity: Montane Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 30	Heavily modified, low sensitivity: Cleared Invaded. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.
WTG 31	Ecological Support Area, Moderate sensitivity: Montane Grassland. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 32	Other Natural Areas, low sensitivity: Plantation/Invaded. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.
WTG 33	Ecological Support Area, Moderate sensitivity: Montane Grassland. The site is designated ECOLOGICAL SUPPORT AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 36	Plantation/Invaded: Low sensitivity. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.

WTG 37	Plantation/Invaded: Low sensitivity, heavily modified. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.
WTG 38	Other Natural Area: Highveld Grassland. The site is designated OTHER NATURAL AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 43	Ecological Support Area: Montane Grassland, Moderate sensitivity. The site is designated ECOLOGICAL SUPPORT AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 44	Ecological Support Area: Montane Grassland, Moderate sensitivity, along a road. The site is designated ECOLOGICAL SUPPORT AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 45	Transformed: Low sensitivity. WTG within transformed area. Final design can avoid any more sensitive areas in surrounds.
WTG 46	Heavily modified: Highveld Grassland. WTG position is on the edge of intact vegetation and transformed area. WEF laydown footprint can thus be aligned to minimise this substantially.
WTG 52	Ecological Support Area: Montane Grassland, Moderate sensitivity. The site is designated ECOLOGICAL SUPPORT AREA AS PER MBSP. Loss associated with a small footprint will not significantly affect ecological processes or connectivity within the broader landscape.
WTG 53	Heavily modified: Highveld Grassland. WTG position is on the edge of intact vegetation and transformed area. WEF laydown footprint can thus be aligned to minimise this substantially.

Subject: RE: SHEEPMOOR WINDPLAAS en 132 Kraglyn

Geagte Mnr. Meyer,

Dit is my voorstel dat u wag vir die Konsepomgwingsimpakstudie rapport (DEIArr) wat teen Vrydag 28 Feb beskikbaar gestel gaan word aan almal, via epos. Dit laat ook toe u die nuutste informasie byderhand het om op kommentaar te lewer.

WSP sal ‘n epos uitstuur met die besonderhede vir wie die kommentaar aan gerig moet word. WSP moet dan formeel op alle kommentaar reageer.

Sodoende volg ons die korrekte formele prosses.

Die epos besonderhede virkommentaar sal in die Konsepomgwingsimpakstudie rapport wees.

Laat gerus indien u verderre vrae het.

Sincerely,

Johans van Wyk
Senior Associate: Landowner Liaison

Vir AANDAG : Johans van Wyk

Dagse

Op 6/2/2025 het mnr. Schalk van der Merwe, wat blykbaar die Sosiale Impakstudie vir Mulilo doen, kaarte ge-epos wat die Finale uitleg van die IWT vir EIA beoordeling van bogemelde windplaas toon.

Die uitleg verskil aansienlik van die konsep aansoek wat noodwendig ook die kommentaar daarop wesenlik beinvloed.

As opsommend die volgende kommentaar

- paaie en kraglyne word oor my eiendom getoon sonder enige konsultasie

- van die turbines is onaanvaarbaar naby wooneenhede. Die meerderheid internationale aanvaarbare minimum afstand is 1,5 km.

- kommersiële jag word op eiendom beoefen waar buitelandse jagters jaarliks deur Lloyd Safaris gereel word. Dit is finansieel baie voordelig. Sigbare turbines is egter onaanvaarbaar vir die jagters.

- ongedierte jag word deur die jaar beoefen op eiendom en vir veiligheid word buffersone van minstens 2 km vanaf my eiendom grense aanbeveel.

- lodge met gras vliegveld word beplan by die waterval vir die buitelandse jagters wat ook toeriste sal insluit. Dit sal nie kan realiseer met sigbare turbines in omgewing wat derhalwe eiendom waarde nadelig sal beinvloed.

- verskeie turbines is te na aan lande geplaas wat lugbespuiting van gewasse onmoontlik sal maak en gevolglik negatief met boerdery praktyke inmeng.

- ondersoek word vereis om impak van turbines op bye kolonies te ondersoek. Bye het essensieule funksie vir bestuiwing van omgewing flora en alternatiewe landbou gewasse o.a. nierbone.

- van die turbine is onaanvaarbaar naby bestaande broei area van bedreigde voël spesies. Die voorgestelde vlieg roetes verteenwoordig nie die werklikheid nie en is onaanvaarbaar.

- groot aantal turbines is op die borand van kruine geplaas wat baie opsigtelik en visueel onaanvaarbaar is.

- die brand versekering laat toe dat van vliegtuie (bommers) gebruik gemaak kan word ingeval van veldbrande. Dit sal nie moontlik wees met die windplaas nie wat eise van die aangrende bosbou kan meebring waarvoor Mulilo aanspreeklik gehou sal word.

- die groot aantal turbines reg oos van my eiendom gaan die mikroklimaat nadelig beinvloed wat negatiewe gevolge op my boerdery en omgewing inhou. Daar word saam met DARDLEA aan gedring op 'n volledige Mikroklimaat Impak Studie deur geakrediteerde onafhanklike instansie deur alle partye goedgekeur.

Deskundige advies word ingewin of die konsolidasie met gepaardgaande veranderings t.o.v. u oorspronklike aansoek nie 'n totaal nuwe aansoek regverdig nie.

Aangesien rooi ligte reeds begin flikker uit u reaksie op kommentaar deur partye in die konsep verslag, versoek ek 'n dringende vergadering met Mulilo en betrokke spesialiste om aangeleentheid te bespreek.

Dit is 'n poging om vertragings en duur uitgerekte regsgedinge te vermei.

Vertrou op 'n spoedige positiewe reaksie vanaf u.

J.Meyer

TO BE PLACED ON ERM'S LETTERHEAD

23 August 2025

PER EMAIL

THE TRUSTEES FOR TIME BEING OF THE PETER CELLIERS TRUST C/O HAYES INCORPORATED

Attention: Riaan Meintjes
Email: riaan@themis.co.za

Dear Mr Meintjes

RE: SUBMISSION OF THE DRAFT EIA REPORT FOR THE MULILO AMSTERDAM WIND ENERGY FACILITY CLUSTER

1 We refer to:

1.1 the Draft Environmental Impact Assessment Reports circulated for public participation on 16 July 2025 in respect of the Sheepmoor and Emvelo Wind Energy Facilities, situated in the Mpumalanga Province ("**Proposed Project**") in respect of the environmental authorisation application ("**EA Application**") submitted by Environmental Resources Management Southern Africa (Pty) Ltd ("**ERM**" or "**us**") on behalf of the Applicants;

1.2 your letter to us, dated 22 April 2025 ("**22 April Letter**"); and

1.3 your emails to us, dated 7 August 2025 and 14 August 2025.

2 Thank you for your comments submitted in respect of the Proposed Project on behalf of the Trustees for the time being of the Peter Celliers Trust ("**Peter Celliers Trust**"), we note the content thereof.

3 The Applicant will apply for approval of aeronautical assessment of aviation obstacles to the Air Traffic and Navigation Services ("**ATNS**") ("**ATNS Approval Application**") under the Civil Aviation Regulations, 2011 (GN 425 of 1 June 2012) ("**Civil Aviation Regulations**") and the Aeronautical Information Circular dated 18 April 2024 (AIC 001-2024) in due course.

4 Please note that the Civil Aviation Regulations indicate that the ATNS Approval Application may be submitted at any time prior to the construction of the Proposed Project.

5 We note from the 22 April Letter that you reference part 1.14 of the SA-CATS 139.01.30 technical standard which prohibited the development of a wind farm within 35 km of an aerodrome. Please be advised that this prohibition has since been removed from SA-CATS 139.01.30 in the Amendment SA-CATS 2 of 2023 document and is no longer in effect.[1]

6 Regarding the concerns raised in paragraph 7 of the 22 April Letter we confirm that landscape-level impacts associated with the proposed wind farm have been assessed by the relevant specialists, including the visual, faunal, and avifaunal specialists. Appropriate mitigation measures will be implemented to manage potential impacts. In particular, specific mitigation measures relating to large terrestrial bird species, such as the Secretary bird, have been outlined in detail within the avifaunal specialist.

7 Finally, we wish to confirm that your comments, including the 22 April Letter, and our responses thereto will be included in the public participation report for the EA Application. The Applicant also confirms that it will keep the Peter Celliers Trust updated regarding the outcome of the ATNS Approval Application. It should be noted that the 22 April Letter was originally submitted outside of the prescribed Public Participation Process (PPP) period and was therefore not included in the original publication report. However, as this letter has since been resubmitted during the current PPP period, within the prescribed timeframes, both the letter and our responses will be incorporated into the Final Comments and Responses Report (CRR).

8 Please do not hesitate to contact the writer of this letter should you have any queries in this regard.

Yours faithfully

ERM Reference: 0684401

Dear Interested and Affected Party, Stakeholder, Organ of State

NOTIFICATION OF AVAILABILITY OF THE DRAFT SCOPING REPORTS FOR PUBLIC REVIEW AND COMMENT OF THE PROPOSED MULILO AMSTERDAM WIND ENERGY FACILITY (EMVELO, ROCHDALE AND SHEEPMOOR) CLUSTER, NEAR ERMELO, MPUMALANGA

Notice is hereby given of a Public Participation Process (PPP) to be undertaken in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA, 1998), as amended.

DFFE Reference(s): To Be Confirmed

Nature of Activity: Emvelo (Pty) Ltd, Rochdale (Pty) Ltd and Sheepmoor (Pty) Ltd ('the Project Applicants') are proposing the construction and operation of three (3) Wind Energy Facilities (WEF). The potential generation capacity of Emvelo WEF is up to 200 MW, Rochdale WEF is up to 220 MW and Sheepmoor up to 360 MW. Each WEF will comprise various buildings, access roads, a battery energy storage system (BESS), and a substation hub with associated electrical grid infrastructure such as but not limited to a 132kV overhead transmission powerline connecting the WEF to the national electrical grid network.

Development Location: The proposed Mulilo WEF's Cluster are located 30 km east of Ermelo within the Msukaligwa Local Municipality, and Gert Sibande District Municipality.

Application Process: In terms of Chapter 5 of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA), Environmental Impact Assessment (EIA) Regulations, 2014 (as amended), the Project Applicants appointed Environmental Resources Management (Pty) Ltd (ERM), to act as the project manager and to undertake the Scoping and Environmental Impact Assessment (S&EIA) processes as the independent environmental impact assessment practitioner (EAP).

ERM has submitted three separate Environmental Applications, including separate Draft Scoping Reports to the Department of Forestry, Fisheries and the Environment (DFFE).

Invitation to Comment: Members of the public, local communities, and stakeholders are invited to comment on the Draft Scoping Reports, which is available for public review and comment, from **Friday, 19 July 2024 to the 20 August 2024 (both days inclusive),** as per Table 1 below.

19 Julie 2024

ERM Verwysing: 0684401

Geagte Belanghebbende en Geaffekteerde Party, Belanghebbende, Staats orgaan

KENNISGEWING VAN BESKIKBAARHEID VAN DIE KONSEP-OMVANGS VERSLAE VIR OPENBARE HERSIENING EN KOMMENTAAR VAN DIE VOORGESTELDE MULILO AMSTERDAM WIND ENERGIE FASILITEIT (EMVELO, ROCHDALE EN SHEEPMOOR) CLUSTER, NABY ERMELO, MPUMALANGA

Kennis word hiermee gegee van 'n openbare deelname proses (ODP) wat in gevolge die Wet op Nasionale Omgewingsbestuur, 1998 (Wet No. 107 van 1998) (NEMA, 1998), soos gewysig, onderneem moet word.

DFFE-verwysing(s): Om bevestig te word

Aard van aktiwiteit: Emvelo (Edms) Bpk, Rochdale (Edms) Bpk en Sheepmoor (Edms) Bpk ('die Projek aansoekers') stel voor dat drie (3) Wind energie fasiliteite (WEF) opgerig en bedryf word. Die potensiële opwekkingsvermoë van Emvelo WEF is tot 200 MW, Rochdale WEF is tot 220 MW en Sheepmoor tot 360 MW. Elke WEF sal bestaan uit verskeie geboue, toegangspaaie, 'n battery-energieberging stelsel (BESS) en 'n substasie naaf met gepaardgaande elektriese netwerk infrastruktuur soos, maar nie beperk tot 'n 132kV oorhoofse transmissie kraglyn wat die WEF met die nasionale elektriese netwerk verbind.

Ontwikkelings ligging: Die voorgestelde Mulilo WEF se cluster is 30 km oos van Ermelo binne die Msukaligwa Plaaslike Munisipaliteit en Gert Sibande Distriksmunisipaliteit geleë.

Aansoek proses: Ingevolge Hoofstuk 5 van die Wet op Nasionale Omgewingsbestuur, 1998 (Wet 107 van 1998 – NEMA), Omgewings Impak studie (EIA) Regulasies, 2014 (soos gewysig), het die Projek aansoekers, Environmental Resources Management (Edms) Bpk (ERM) aangestel om as projek bestuurder op te tree en die Omvang- en Omgewings Impak bepalings prosesse (S&EIA) as die onafhanklike omgewings impak bepalings praktisyn (EAP) te onderneem.

ERM het drie afsonderlike omgewings aansoeke ingedien, waaronder afsonderlike konsep-omvang verslae aan die departement van bosbou, visserye en die omgewing (DFFE).

Uitnodiging om kommentaar te lewer: Lede van die publiek, plaaslike gemeenskappe en belanghebbendes word uitgenooi om kommentaar te lewer op die konsep-omvang verslae, wat beskikbaar is vir openbare hersiening en kommentaar, vanaf **Vrydag, 19 Julie 2024 tot die 20 Augustus 2024 (albei dae ingesluit),** soos per Tabel 1 hieronder.

Tabel 1: Liggings vir openbare oorsig en kommentaar

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

Dear Interested and Affected Party, Stakeholder, Organ of State

NOTIFICATION OF AVAILABILITY OF THE DRAFT SCOPING REPORTS FOR PUBLIC REVIEW AND COMMENT OF THE PROPOSED AMSTERDAM WIND ENERGY FACILITY (EMVELO, ROCHDALE AND SHEEPMOOR) CLUSTER, NEAR ERMELO, MPUMALANGA

Notice is hereby given of a Public Participation Process (PPP) to be undertaken in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA, 1998), as amended.

DFFE Reference(s): To Be Confirmed

Nature of Activity: Emvelo Wind Energy Facility (Pty) Ltd, Rochdale Wind Energy Facility (Pty) Ltd and Sheepmoor Wind Energy Facility (Pty) Ltd ('the Project Applicants') are proposing the construction and operation of three (3) Wind Energy Facilities (WEF). The potential generation capacity of Emvelo WEF is up to 200 MW, Rochdale WEF is up to 220 MW and Sheepmoor up to 360 MW. Each WEF will comprise various buildings, access roads, a battery energy storage system (BESS), and a substation hub with associated electrical grid infrastructure such as but not limited to a 132kV overhead transmission powerline connecting the WEF to the national electrical grid network.

Development Location: The proposed Amsterdam WEF's Cluster are located 30 km east of Ermelo within the Msukaligwa Local Municipality, and Gert Sibande District Municipality.

Application Process: In terms of Chapter 5 of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA), Environmental Impact Assessment (EIA) Regulations, 2014 (as amended), the Project Applicants appointed Environmental Resources Management (Pty) Ltd (ERM), to act as the project manager and to undertake the Scoping and Environmental Impact Assessment (S&EIA) processes as the independent environmental impact assessment practitioner (EAP).

ERM has submitted three separate Environmental Applications, including separate Draft Scoping Reports to the Department of Forestry, Fisheries and the Environment (DFFE).

Invitation to Comment: Members of the public, local communities, and stakeholders are invited to comment on the Draft Scoping Reports, which is available for public review and comment, from **Friday, 19 July 2024 to the 20 August 2024 (both days inclusive)**, as per Table 1 below.

The potential generation capacity of Emvelo WEF is up to 200 MW, Rochdale WEF is up to 220 MW and Sheepmoor up to 360 MW. Each WEF will comprise various buildings, access roads, a battery energy storage system (BESS), and a substation hub with associated electrical grid infrastructure such as but not limited to a 132kV overhead transmission powerline connecting the WEF to the national electrical grid network.

Development Location: The proposed Amsterdam WEF's Cluster are located 30 km east of Ermelo within the Msukaligwa Local Municipality, and Gert Sibande District Municipality.

Application Process: In terms of Chapter 5 of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA), Environmental Impact Assessment (EIA) Regulations, 2014 (as amended), the Project Applicants appointed Environmental Resources Management (Pty) Ltd (ERM), to act as the project manager and to undertake the Scoping and Environmental Impact Assessment (S&EIA) processes as the independent environmental impact assessment practitioner (EAP).

ERM has submitted three separate Environmental Applications, including separate Draft Scoping Reports to the Department of Forestry, Fisheries and the Environment (DFFE).

Invitation to Comment: Members of the public, local communities, and stakeholders are invited to comment on the Draft Scoping Reports, which is available for public review and comment, from **Friday, 19 July 2024 to the 20 August 2024 (both days inclusive)**, as per Table 1 below.

Table 1: Public Review and Comment Locations

Location	Physical Address
Electronic Copy Locations (Available for download below)	
Via One Drive	I&APs can request for copies to be sent via one drive shared folder.
Hard Copy Location	

Registered office
Environmental Resources Management
Southern Africa (Pty) Ltd
1st Floor, Building 32
The Woodlands Office Park
Woodlands Drive, Woodmead
2148, Johannesburg, South Africa

Registered number: 2003/001404/07
VAT registration: 4780205482

Offices worldwide

Directors
Claudio Bertora
Urmilla Bob (Non-Executive)
Tania Swanepoel
Marinda Rasmussen

Ermelo Public Library	Ermelo, 2350
CD Copies will be made upon request to the EAP.	

Should you wish to be registered as an I&AP and / or would like comment please submit your name, interest in the project or comment, email and postal address and telephone number in writing to the below address:	
Environmental Resources Management Southern Africa (Pty) Ltd	
Project Reference: 0684401 Mulilo WEF Cluster	**Contact Person:** Lucien Barbeau
Email: ERM.ArcusAmsterdam@erm.com	**Telephone:** +27117985400
Post: Postnet Suite 90, Private Bag X12, Tokai, 7966	**Online:** https://mulilowef.aidaform.com/public-participation-form

Following the 30-day public participation, the comments will be addressed and incorporated into the Final Scoping Reports, which will be submitted to the DFFE for approval to progress to the EIA Phase.

Please note, regarding the Protection of Personal Information Act (PoPI Act 4 of 2013, as amended): If you request to register as an I&AP, your personal information will be made available to an appellant in the case of an appeal, and an applicant/EAP/independent person for purposes of being informed and given access to an audit report.

Correspondence throughout the Application Process will only be distributed to Registered I&APs. Registration is possible throughout the Application Process.

Thank you for the interest in the project.

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final

Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

ERM

TO WHOM IT MAY CONCERN

Eskom requirements for work in or near Eskom servitudes.

1. Eskom's rights and services must be acknowledged and respected at all times.

2. Eskom shall at all times retain unobstructed access to and egress from its servitudes.

3. Eskom's consent does not relieve the developer from obtaining the necessary statutory, land owner or municipal approvals.

4. Any cost incurred by Eskom as a result of non-compliance to any relevant environmental legislation will be charged to the developer.

5. If Eskom has to incur any expenditure in order to comply with statutory clearances or other regulations as a result of the developer's activities or because of the presence of his equipment or installation within the servitude restriction area, the developer shall pay such costs to Eskom on demand.

6. The use of explosives of any type within 500 metres of Eskom's services shall only occur with Eskom's previous written permission. If such permission is granted the developer must give at least fourteen working days prior notice of the commencement of blasting. This allows time for arrangements to be made for supervision and/or precautionary instructions to be issued in terms of the blasting process. It is advisable to make application separately in this regard.

7. Changes in ground level may not infringe statutory ground to conductor clearances or statutory visibility clearances. After any changes in ground level, the surface shall be rehabilitated and stabilised so as to prevent erosion. The measures taken shall be to Eskom's satisfaction.

8. Eskom shall not be liable for the death of or injury to any person or for the loss of or damage to any property whether as a result of the encroachment or of the use of the servitude area by the developer, his/her agent, contractors, employees, successors in title, and assignees. The developer indemnifies Eskom against loss, claims or damages including claims pertaining to consequential damages by third parties and whether as a result of damage to or interruption of or interference with Eskom's services or apparatus or otherwise. Eskom will not be held responsible for damage to the developer's equipment.

9. No mechanical equipment, including mechanical excavators or high lifting machinery, shall be used in the vicinity of Eskom's apparatus and/or services, without prior written permission having been granted by Eskom. If such permission is granted the developer must give at least seven working days' notice prior to the commencement of work. This allows time for arrangements to be made for supervision and/or precautionary instructions to be issued by the relevant Eskom Manager

Note: Where and electrical outage is required, at least fourteen work days are required to arrange it.

10. Eskom's rights and duties in the servitude shall be accepted as having prior right at all times and shall not be obstructed or interfered with.

11. Under no circumstances shall rubble, earth or other material be dumped within the servitude restriction area. The developer shall maintain the area concerned to Eskom's satisfaction. The developer shall be liable to Eskom for the cost of any remedial action which has to be carried out by Eskom.

12. The clearances between Eskom's live electrical equipment and the proposed construction work shall be observed as stipulated by *Regulation 15* of the *Electrical Machinery Regulations of the Occupational Health and Safety Act, 1993 (Act 85 of 1993).*

13. Equipment shall be regarded electrically live and therefore dangerous at all times.

14. In spite of the restrictions stipulated by Regulation 15 of the Electrical Machinery Regulations of the Occupational Health and Safety Act, 1993 (Act 85 of 1993), as an additional safety precaution, Eskom will not approve the erection of houses, or structures occupied or frequented by human beings, under the power lines or within the servitude restriction area.

15. Eskom may stipulate any additional requirements to highlight any possible exposure to Customers or Public to coming into contact or be exposed to any dangers of Eskom plant.

16. It is required of the developer to familiarise himself with all safety hazards related to Electrical plant.

17. Any third party servitudes encroaching on Eskom servitudes shall be registered against Eskom's title deed at the developer's own cost. If such a servitude is brought into being, its existence should be endorsed on the Eskom servitude deed concerned, while the third party's servitude deed must also include the rights of the affected Eskom servitude.

CONTROLLED DISCLOSURE

When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

EXECUTIVE SUMMARY

In recent decades, the use of wind turbines, concentrated solar plants and photovoltaic plants have been on the increase as it serves as an abundant source of energy. This document specifies proposed setbacks for wind turbines and the reasons for these setbacks from infrastructure as well as setbacks for concentrated solar plants and photovoltaic plants. Setbacks for wind turbines employed in other countries were compared and a general setback to be used by Eskom was suggested for use with wind turbines and other renewable energy generation plants.

CONTROLLED DISCLOSURE

When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

1. INTRODUCTION

During the last few decades, a large amount of wind turbines have been installed in wind farms to accommodate for the large demand of energy and depleting fossil fuels. Wind is one of the most abundant sources of renewable energy. Wind turbines harness the energy of this renewable resource for integration in electricity networks. The extraction of wind energy is its primary function and thus the aerodynamics of the wind turbine is important. There are many different types of wind turbines which will all exhibit different wind flow characteristics. The most common wind turbine used commercially is the Horizontal Axis Wind Turbine. Wind flow characteristics of this turbine are important to analyse as it may have an effect on surrounding infrastructure.

Wind turbines also cause large turbulence downwind that may affect existing infrastructure. Debris or parts of the turbine blade, in the case of a failure, may be tossed behind the turbine and may lead to damage of infrastructure in the wake path.

This document outlines the minimum distances that need to be introduced between a wind turbine and Eskom infrastructure to ensure that debris and / or turbulence would not negatively impact on the infrastructure and future expansion of infrastructure (lines and substation) as per the long term planning scenario.

Safety distances of wind turbines from other structures as implemented by other countries were also considered and the reasons for their selection were noted. All renewable energy developments are approved by The Department of Environmental Affairs, Forestry and Fisheries (DEFF) in terms of NEMA. The DEFF is aware of the setbacks guideline, however they cannot use it in terms of decision making since the setbacks document has no legal standing in SA and it would be outside of their mandate who have been advised to follow the guidelines herein.

Concentrated solar plants and photovoltaic plants setbacks away from substations were also to be considered to prevent restricting possible power line access routes to the substation and possible expansion of substations.

2. SUPPORTING CLAUSES

2.1 SCOPE

This document provides guidance on the safe distance that a wind turbine should be located from any Eskom power line or substation. Although it is not based on any legislative requirement, it is deemed important that Eskom’s infrastructure and future network expansion planning is not impeded. The document specifies proposed setback distances for transmission lines (220 kV to 765 kV), distribution lines

CONTROLLED DISCLOSURE
When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

(66 kV to 132 kV) and all Eskom substations. Proposed setbacks for concentrated solar plants and photovoltaic plants are also specified away from substations.

2.1.1 Purpose

Setbacks for wind turbines and power lines / substations are required for various reasons. These include possible catastrophic failure of the turbine blade that may release fragments and which may be thrown onto nearby power lines that may result in damage with associated unplanned outages. Turbulence behind the turbine may affect helicopter flight during routine Eskom live line maintenance and inspections that may lead to safety risk of the aircraft / personnel. Concentrated solar plants and photovoltaic plants setback away from substations were required to prevent substations from being boxed in by these renewable generation plants limiting line route access to the substations and possible future substation expansion.

2.1.2 Applicability

This document is applicable to the siting of all new and existing wind turbines, concentrated solar plants and photovoltaic plants near power lines and substations and in line of site between Eskom telecommunication infrastructure, including future Eskom renewable energy development.

2.2.2 Informative

None

CONTROLLED DISCLOSURE
When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

2.3 DEFINITIONS

Definition	Description
Setback	The minimum distance between a wind turbine and boundary line/dwelling/road/infrastructure/servitude etc.
Flicker	Effect caused when rotating wind turbine blades periodically cast shadows
Tip Height	The total height of the wind turbine ie. Hub height plus half rotor diameter (see Figure1)

2.3.1 Disclosure Classification

Controlled disclosure: controlled disclosure to external parties (either enforced by law, or discretionary).

2.4 ABBREVIATIONS

Abbreviation	Description
None	

2.5 ROLES AND RESPONSIBILITIES

All parties involved in the positioning wind turbines, concentrated solar plants and photovoltaic plants near power lines/substations should endeavour to follow the setbacks outlined in this guideline.

2.6 PROCESS FOR MONITORING

Agreement by Eskom in writing on any encroachment of the setbacks distance should be requested via the Grid Access Unit. Eskom should ensure that every application for renewable energy (RE) developments are informed about the existence of the setbacks document early in the RE planning process to ensure maximum effect. This includes Eskom RE development.

2.7 RELATED/SUPPORTING DOCUMENTS

None

3. DOCUMENT CONTENT

3.1 INTERNATIONAL SETBACK COMPARISON

Wind Turbine setbacks employed by various countries were considered. It was found that setbacks were determined for various reasons that include noise, flicker, turbine blade failure and wind effects as well as

CONTROLLED DISCLOSURE
When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

future network expansion planning. The distances (setbacks) varied based on these factors and were influenced by the type of infrastructure

Wind turbine setbacks varied for roads, power lines, dwellings, buildings and property and it was noted that the largest setbacks were employed for reasons of noise and flicker related issues [1-7]. Very few countries specified setbacks for power lines.

The literature survey [1-7], yielded information about studies and experiments were conducted to determine the distance that a broken fragment from a wind turbine might be thrown. Even though of low probability of hitting a power line [$5.0x10^{-5}$ [8]], the distances recorded were significant [750m [8]]

Wind turbines may also cause changes in wind patterns with turbulent effects behind the hub. These factors influence the wind turbine setbacks specified in this document.

Setbacks were thus introduced to prevent any damage to Eskom infrastructure and impedance to operation and future network expansion planning.

Renewable energy plant can also limit access into substations for power lines of all voltages. A setback distance should therefore be employed to prevent substations from being boxed in by these generation plants and preventing future network expansion. These setback distances are specified in this document.

3.2 ESKOM RECOMMENDED SETBACKS

Any renewable energy applicant should engage with Eskom to determine if their plant layout or positioning of turbines, CSP or PV infrastructure would encroach on the proposed setbacks provided for in this guideline and to ensure that their planning and Eskom's future expansion planning is taken into account. Eskom must inform all renewable energy developers, including Eskom RE, of the existence of the setbacks guideline early in the development process. Should there be an encroachment, a formal request should be sent to and accepted by Eskom in writing if any of the below mentioned setback distances are infringed upon:

- Eskom requests a setback distance of 3 times the tip height of the wind turbine from the edge of the closest Eskom servitude (including vacant servitudes) for transmission lines (220kV to 765kV) and Substations.
- Eskom requests a setback distance of 1 times the tip height of the wind turbine from the edge of the closest Eskom servitude (including vacant servitudes) for distribution lines (66 kV to 132 kV) and Substations.

CONTROLLED DISCLOSURE

When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

- A written request should be sent to Eskom via the Grid Access Unit regarding any proposed wind turbine, concentrated solar plants and photovoltaic activity within a 5 km radius of a substation for Eskom to comment on.
- Where concentrated solar plants, photovoltaic structures, battery storage systems (BESS) and other renewable generation plants fall within a 2 km radius of the closest point of a transmission or distribution substation (66kV to 765kV), a written agreement with Eskom is recommended during the planning phase of such plant or structures to ensure Eskom's future planning is not impeded.
- Applicants should not position any wind turbine in the line of site between and two Eskom Radio Telecommunication masts. It should be proven that Eskom radio telecommunication systems (mainly microwave systems) will not be affected in any way by wind turbines due to the criticality of this infrastructure in terms of network operation. Eskom Telecommunications should be engaged on this matter.
- If the position or size of any turbine changes and subsequently infringes on any of the above stated setbacks, a request for relaxation must be sent through to Eskom as per the point mentioned above.

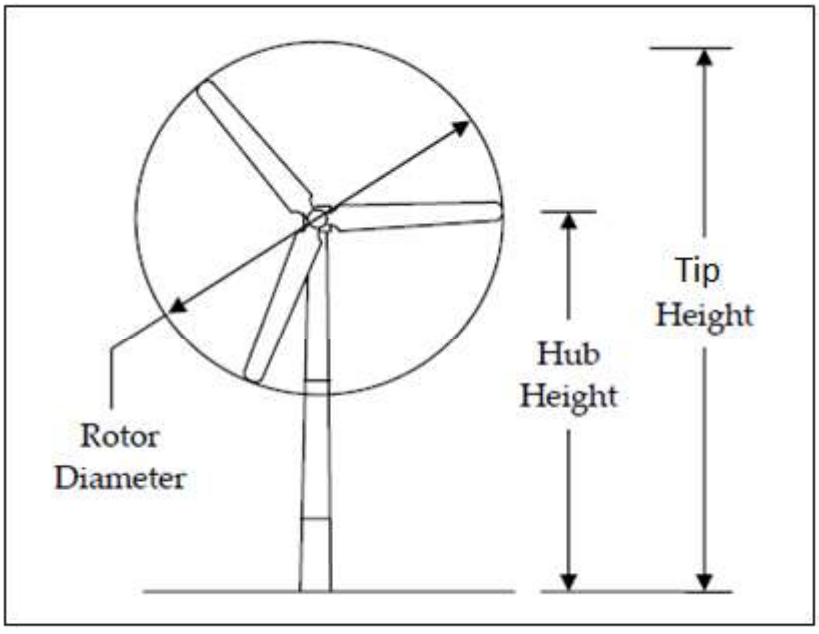

Figure 1: Horizontal Axis Wind Turbine [2]

EXTERNAL MESSAGE

Dear Sir/Madam

ACKNOWLEDGEMENT OF RECEIPT OF THE NEW APPLICATION FORM AND DRAFT SCOPING REPORT FOR THE PROPOSED CARLETONVILLE SOLAR PHOTOVOLTAIC PLANT AND ASSOCIATED INFRASTRUCTURE ON REMAINDER OF FARM TWYFELVLAKTE NO. 105, MERAFONG CITY LOCAL MUNICIPALITY, WEST RAND DISTRICT MUNICIPALITY, GAUTENG PROVINCE.

The Department confirms having received the Application Form and Draft Scoping Report for Environmental Authorisation for the abovementioned project on 22 July 2024. You have submitted these documents to comply with the Environmental Impact Assessment (EIA) Regulations, 2014, as amended.

Kindly note that your application for Environmental Authorisation falls within the ambit of an application applied for in terms of Part 3 of Chapter 4 of the EIA Regulations, 2014, as amended. You are therefore referred to Regulation 21 of the EIA Regulations, 2014 as amended.

Please take note of Regulation 40(3) of the EIA Regulations, 2014, as amended, which states that potential Interested & Affected Parties, including the Competent Authority, may be provided with an opportunity to comment on reports and plans contemplated in Regulation 40(1) of the EIA Regulations, 2014, as amended, prior to the submission of an application but must be provided an opportunity to comment on such reports once an application has been submitted to the Competent Authority.

Note that in terms of Regulation 45 of the EIA Regulations, 2014, as amended, this application will lapse if the applicant fails to meet any of the time-frames prescribed in terms of these Regulations, unless an extension has been granted by the Department in terms of Regulation 3(7) of the EIA Regulations, 2014, as amended.

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Kind Regards,
Lydia Kutu

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

Hi Lloyd,

Are you able to try and access the link once again? We have slightly modified the form now that allows the IAP to view the ERM website for the WEF Cluster. Additionally, the landing page has been updated accordingly. Noted all documents will be reviewed to not mention Mulilo prior to Final scoping submission.

Kind Regards

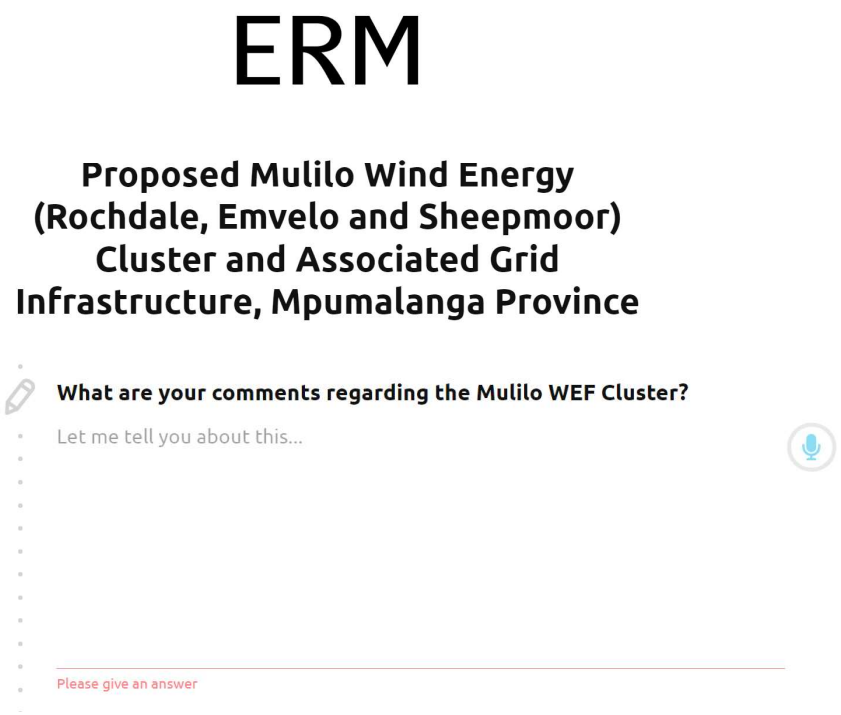
Subject: RE: Notification of Submission: Draft scoping Report Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga



EXTERNAL MESSAGE

Good day Lucien,

I followed the link provided below and it took me to a landing page. After completing the required information, I didn't receive a link to the reports, nor did the documents automatically download.
Please may you kindly explain how an I&AP would access docs? Worryingly, we can only find Emvelo and Sheepmoor when doing a simple Google Search.
Once updated, could you please let me know, as we like to furnish the LO's with the links

personally. Ideally today.

Also, I noted that within the Draft Scoping Reports, and now on the I&AP landing page, that **Mulilo** is constantly referred to. i.e below.

Earlier on in the process, it was explicitly mentioned that there should be **NO** reference to Mulilo. We did not name it the Mulilo WEF cluster, nor is Mulilo the applicant. Please could this landing page be updated to remove reference to Mulilo. Post PP, could **all** documents please be reviewed to remove this reference, unless extremely necessary.

Kind Regards,

Lloyd Barnes

Dear Sir/Madam

ACKNOWLEDGEMENT OF RECEIPT OF THE NEW APPLICATION FORM AND DRAFT SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, AND GERT SIBANDE DISTRICT MUNICIPALITY, MPUMALANGA PROVINCE.

The Department confirms having received the Application Form and Draft Scoping Report for Environmental Authorisation for the abovementioned project on 22 July 2024. You have submitted these documents to comply with the Environmental Impact Assessment (EIA) Regulations, 2014, as amended.

Kindly note that your application for Environmental Authorisation falls within the ambit of an application applied for in terms of Part 3 of Chapter 4 of the EIA Regulations, 2014, as amended. You are therefore referred to Regulation 21 of the EIA Regulations, 2014 as amended.

Please take note of Regulation 40(3) of the EIA Regulations, 2014, as amended, which states that potential Interested & Affected Parties, including the Competent Authority, may be provided with an opportunity to comment on reports and plans contemplated in Regulation 40(1) of the EIA Regulations, 2014, as amended, prior to the submission of an application but must be provided an opportunity to comment on such reports once an application has been submitted to the Competent Authority.

Note that in terms of Regulation 45 of the EIA Regulations, 2014, as amended, this application will lapse if the applicant fails to meet any of the time-frames prescribed in terms of these Regulations, unless an extension has been granted by the Department in terms of Regulation 3(7) of the EIA Regulations, 2014, as amended.

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Kind Regards,
Lydia Kutu

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY

(SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	DESIGNATION	EMAIL	PHONE
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe Mbuyane	Deputy Director: EIM Gert Sibande District	mbuyanesb@mpg.gov.za	[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	
MTPA	**DESIGNATION**	**EMAIL**	**PHONE**
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za

Celia de	EIA Data Capturer	celia.dewaal@mtpa.co.za	[redacted]

Waal	LUA		[redacted]

Please note that time frames for commenting on draft reports can only commence on the date that hard copies of the reports are received, and we request that our 30 day time frame aligns with DFFE's.

Kind Regards
Robyn

Hi there

Christophe sent me the attached KML file and the below links. I see these are links to scoping reports dated 19 July 2024. They seem to have started with the application process while not yet consulting us.

Celia, could you please write to ERM to request copies of the three wind farm documents for comment.

Robyn/Sindy, you may want to do the same.

I have updated our webmap with these latest boundaries from the KML file.

Best wishes
Mervyn

Good afternoon everyone,

Thank you so much for your time and very valuable feedback and recommendations.

Ryan and I are now back in Cape Town and addressing your comments.

We have liaised back with our EAP and will provide you with further information shortly.

Thanks again for taking the time to meet with us and for the transparency, we highly appreciate it.

I will be sending a couple of emails in the next few days in line with our engagement.

Kind regards,

Christophe

Good day Robyn,

Please note that DARDLEA and MTPA were notified regarding the PP for the Draft scoping Phase on the 19th July 2024. Kindly see proof of notification below:

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

Environmental Assessment Practitioner

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	DESIGNATION	EMAIL	PHONE
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe Mbuyane	Deputy Director: EIM Gert Sibande District	mbuyanesb@mpg.gov.za	[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	
MTPA	**DESIGNATION**	**EMAIL**	**PHONE**
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za	
Khumbelo Malele	Land Use Advisor	Khumbelo.Malele@mtpa.co.za khumbelomalele@gmail.com	[redacted]
Celia de Waal	EIA Data Capturer LUA	celia.dewaal@mtpa.co.za	[redacted]

Please note that time frames for commenting on draft reports can only commence on the date that hard copies of the reports are received, and we request that our 30 day time frame aligns with DFFE's.

Kind Regards
Robyn

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	DESIGNATION	EMAIL	PHONE
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe Mbuyane	Deputy Director: EIM Gert Sibande District	mbuyanesb@mpg.gov.za	[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	
MTPA	**DESIGNATION**	**EMAIL**	**PHONE**
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za	
Khumbelo Malele	Land Use Advisor	Khumbelo.Malele@mtpa.co.za khumbelomalele@gmail.com	[redacted]
Celia de Waal	EIA Data Capturer LUA	celia.dewaal@mtpa.co.za	[redacted]

Please note that time frames for commenting on draft reports can only commence on the date that hard copies of the reports are received, and we request that our 30 day time frame aligns with DFFE's.

Kind Regards
Robyn

Good day Robyn,

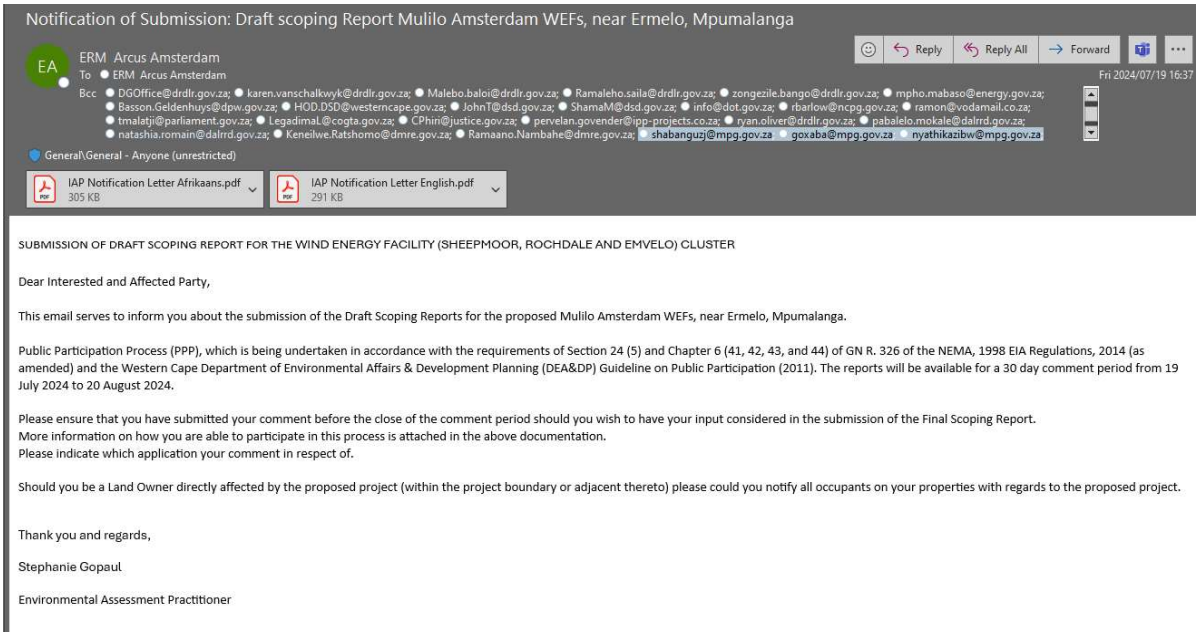
Please note that DARDLEA and MTPA were notified regarding the PP for the Draft scoping Phase on the 19th July 2024. Kindly see proof of notification below:

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.



Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

Environmental Assessment Practitioner

Thanks, they will have to relook at their turbine layouts with regards to the setbacks requirements of 3 x tip height from TX lines and 1 x tip height from Dx lines. Lines connecting to power stations are extremely sensitive and chance are we may no grant setbacks relaxation.

CONTROLLED DISCLOSURE

When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

EXECUTIVE SUMMARY

In recent decades, the use of wind turbines, concentrated solar plants and photovoltaic plants have been on the increase as it serves as an abundant source of energy. This document specifies proposed setbacks for wind turbines and the reasons for these setbacks from infrastructure as well as setbacks for concentrated solar plants and photovoltaic plants. Setbacks for wind turbines employed in other countries were compared and a general setback to be used by Eskom was suggested for use with wind turbines and other renewable energy generation plants.

CONTROLLED DISCLOSURE

When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

1. INTRODUCTION

During the last few decades, a large amount of wind turbines have been installed in wind farms to accommodate for the large demand of energy and depleting fossil fuels. Wind is one of the most abundant sources of renewable energy. Wind turbines harness the energy of this renewable resource for integration in electricity networks. The extraction of wind energy is its primary function and thus the aerodynamics of the wind turbine is important. There are many different types of wind turbines which will all exhibit different wind flow characteristics. The most common wind turbine used commercially is the Horizontal Axis Wind Turbine. Wind flow characteristics of this turbine are important to analyse as it may have an effect on surrounding infrastructure.

Wind turbines also cause large turbulence downwind that may affect existing infrastructure. Debris or parts of the turbine blade, in the case of a failure, may be tossed behind the turbine and may lead to damage of infrastructure in the wake path.

This document outlines the minimum distances that need to be introduced between a wind turbine and Eskom infrastructure to ensure that debris and / or turbulence would not negatively impact on the infrastructure and future expansion of infrastructure (lines and substation) as per the long term planning scenario.

Safety distances of wind turbines from other structures as implemented by other countries were also considered and the reasons for their selection were noted. All renewable energy developments are approved by The Department of Environmental Affairs, Forestry and Fisheries (DEFF) in terms of NEMA. The DEFF is aware of the setbacks guideline, however they cannot use it in terms of decision making since the setbacks document has no legal standing in SA and it would be outside of their mandate who have been advised to follow the guidelines herein.

Concentrated solar plants and photovoltaic plants setbacks away from substations were also to be considered to prevent restricting possible power line access routes to the substation and possible expansion of substations.

2. SUPPORTING CLAUSES

2.1 SCOPE

This document provides guidance on the safe distance that a wind turbine should be located from any Eskom power line or substation. Although it is not based on any legislative requirement, it is deemed important that Eskom’s infrastructure and future network expansion planning is not impeded. The document specifies proposed setback distances for transmission lines (220 kV to 765 kV), distribution lines

CONTROLLED DISCLOSURE
When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

(66 kV to 132 kV) and all Eskom substations. Proposed setbacks for concentrated solar plants and photovoltaic plants are also specified away from substations.

2.1.1 Purpose

Setbacks for wind turbines and power lines / substations are required for various reasons. These include possible catastrophic failure of the turbine blade that may release fragments and which may be thrown onto nearby power lines that may result in damage with associated unplanned outages. Turbulence behind the turbine may affect helicopter flight during routine Eskom live line maintenance and inspections that may lead to safety risk of the aircraft / personnel. Concentrated solar plants and photovoltaic plants setback away from substations were required to prevent substations from being boxed in by these renewable generation plants limiting line route access to the substations and possible future substation expansion.

2.1.2 Applicability

This document is applicable to the siting of all new and existing wind turbines, concentrated solar plants and photovoltaic plants near power lines and substations and in line of site between Eskom telecommunication infrastructure, including future Eskom renewable energy development.

2.2.2 Informative

None

CONTROLLED DISCLOSURE
When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

2.3 DEFINITIONS

Definition	Description
Setback	The minimum distance between a wind turbine and boundary line/dwelling/road/infrastructure/servitude etc.
Flicker	Effect caused when rotating wind turbine blades periodically cast shadows
Tip Height	The total height of the wind turbine ie. Hub height plus half rotor diameter (see Figure1)

2.3.1 Disclosure Classification

Controlled disclosure: controlled disclosure to external parties (either enforced by law, or discretionary).

2.4 ABBREVIATIONS

Abbreviation	Description
None	

2.5 ROLES AND RESPONSIBILITIES

All parties involved in the positioning wind turbines, concentrated solar plants and photovoltaic plants near power lines/substations should endeavour to follow the setbacks outlined in this guideline.

2.6 PROCESS FOR MONITORING

Agreement by Eskom in writing on any encroachment of the setbacks distance should be requested via the Grid Access Unit. Eskom should ensure that every application for renewable energy (RE) developments are informed about the existence of the setbacks document early in the RE planning process to ensure maximum effect. This includes Eskom RE development.

2.7 RELATED/SUPPORTING DOCUMENTS

None

3. DOCUMENT CONTENT

3.1 INTERNATIONAL SETBACK COMPARISON

Wind Turbine setbacks employed by various countries were considered. It was found that setbacks were determined for various reasons that include noise, flicker, turbine blade failure and wind effects as well as

CONTROLLED DISCLOSURE
When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

future network expansion planning. The distances (setbacks) varied based on these factors and were influenced by the type of infrastructure

Wind turbine setbacks varied for roads, power lines, dwellings, buildings and property and it was noted that the largest setbacks were employed for reasons of noise and flicker related issues [1-7]. Very few countries specified setbacks for power lines.

The literature survey [1-7], yielded information about studies and experiments were conducted to determine the distance that a broken fragment from a wind turbine might be thrown. Even though of low probability of hitting a power line [$5.0x10^{-5}$ [8]], the distances recorded were significant [750m [8]]

Wind turbines may also cause changes in wind patterns with turbulent effects behind the hub. These factors influence the wind turbine setbacks specified in this document.

Setbacks were thus introduced to prevent any damage to Eskom infrastructure and impedance to operation and future network expansion planning.

Renewable energy plant can also limit access into substations for power lines of all voltages. A setback distance should therefore be employed to prevent substations from being boxed in by these generation plants and preventing future network expansion. These setback distances are specified in this document.

3.2 ESKOM RECOMMENDED SETBACKS

Any renewable energy applicant should engage with Eskom to determine if their plant layout or positioning of turbines, CSP or PV infrastructure would encroach on the proposed setbacks provided for in this guideline and to ensure that their planning and Eskom's future expansion planning is taken into account. Eskom must inform all renewable energy developers, including Eskom RE, of the existence of the setbacks guideline early in the development process. Should there be an encroachment, a formal request should be sent to and accepted by Eskom in writing if any of the below mentioned setback distances are infringed upon:

- Eskom requests a setback distance of 3 times the tip height of the wind turbine from the edge of the closest Eskom servitude (including vacant servitudes) for transmission lines (220kV to 765kV) and Substations.
- Eskom requests a setback distance of 1 times the tip height of the wind turbine from the edge of the closest Eskom servitude (including vacant servitudes) for distribution lines (66 kV to 132 kV) and Substations.

CONTROLLED DISCLOSURE

When downloaded from the EDMS, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

- A written request should be sent to Eskom via the Grid Access Unit regarding any proposed wind turbine, concentrated solar plants and photovoltaic activity within a 5 km radius of a substation for Eskom to comment on.
- Where concentrated solar plants, photovoltaic structures, battery storage systems (BESS) and other renewable generation plants fall within a 2 km radius of the closest point of a transmission or distribution substation (66kV to 765kV), a written agreement with Eskom is recommended during the planning phase of such plant or structures to ensure Eskom's future planning is not impeded.
- Applicants should not position any wind turbine in the line of site between and two Eskom Radio Telecommunication masts. It should be proven that Eskom radio telecommunication systems (mainly microwave systems) will not be affected in any way by wind turbines due to the criticality of this infrastructure in terms of network operation. Eskom Telecommunications should be engaged on this matter.
- If the position or size of any turbine changes and subsequently infringes on any of the above stated setbacks, a request for relaxation must be sent through to Eskom as per the point mentioned above.

Hi Lloyd,

I would like to respond with the following:

The layout will be revised, taking into account the WTG's that are within the proximity of the existing transmission lines. We will ensure that these turbines are 3x the Tip height from existing Electrical infrastructure.

Please let me know if you are happy with the above statement. I have attached the guidelines as well.

Thank you,

ERM

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

Subject: RE: [CAUTION:EXTERNAL EMAIL] Notification of Submission: Draft scoping Report Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga

Hi Lloyd,

I would like to respond with the following:

The layout will be revised, taking into account the WTG's that are within the proximity of the existing transmission lines. We will ensure that these turbines are 3x the Tip height from existing Electrical infrastructure.

Please let me know if you are happy with the above statement. I have attached the guidelines as well.

Thank you,

EXTERNAL MESSAGE

Thanks, they will have to relook at their turbine layouts with regards to the setbacks requirements of 3 x tip height from TX lines and 1 x tip height from Dx lines. Lines connecting to power stations are extremely sensitive and chance are we may no grant setbacks relaxation.

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping

Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

Good day Stephanie,

Be advised that the names of the officials at MTPA that you have highlighted in your below notification are **not the relevant officials** that are required to be notified or the relevant officials that must review and comment on draft Scoping or EIA reports, or any reports related to an EIA process. There are also no officials in the list of officials in your screenshots that are in the Environmental Affairs Chief Directorate in MDARDLEA - as far as I am aware they are in the section that deals with Agriculture, which is an entirely different mandate.

It would **not** be acceptable to not provide the commenting authority the mandatory 30 days to review and comment on draft reports, especially in light of the fact that there has been no prior notification. The Directorate Environmental Impact Management within DARDLEA represents the MEC as Competent Authority in Mpumalanga, and the commenting authority in respect projects administered by DFFE. MTPA has the mandate for biodiversity matters on behalf of DARDLEA. As per my email to you below (3 August), hard copies of all reports must be submitted to Ms Mbuyane (Environmental Impact Management) at our Ermelo office, and the documents must be made available to me (and in this instance to Mr Cowden and Mr Lotter) electronically at the same time. You will need to contact Ms De Waal and Mr Krige at MTPA to confirm how documents must be submitted to MTPA. Please provide shape files of the 3 proposed WEFs as well.

Regards
Robyn

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	DESIGNATION	EMAIL	PHONE
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe Mbuyane	Deputy Director: EIM Gert Sibande District	mbuyanesb@mpg.gov.za	[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	
MTPA	**DESIGNATION**	**EMAIL**	**PHONE**
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za

EXTERNAL MESSAGE

Good day,

Please see my email response to you on 7 August as per below email thread. I have not had a response and we still await the draft reports for commenting. Please urgently advise how this is being addressed. I have just had an email from MTPA stating that you are busy sending them the draft reports. Please confirm when I will receive a link to the reports, and when our Ms Mbuyane will receive the hard copies. Please also confirm that we (both DARDLEA and MTPA) will be provided with the mandatory 30 days to comment.

Should you wish to discuss this further please call me on 0826727868.

Regards
Robyn

Good day Stephanie,

Be advised that the names of the officials at MTPA that you have highlighted in your below notification are**not the relevant officials** that are required to be notified or the relevant officials that must review and comment on draft Scoping or EIA reports, or any reports related to an EIA process. There are also no officials in the list of officials in your screenshots that are in the Environmental Affairs Chief Directorate in MDARDLEA - as far as I am aware they are in the section that deals with Agriculture, which is an entirely different mandate.

It would **not**be acceptable to not provide the commenting authority the mandatory 30 days to review and comment on draft reports, especially in light of the fact that there has been no prior notification. The Directorate Environmental Impact Management within DARDLEA represents the MEC as Competent Authority in Mpumalanga, and the commenting authority in respect projects administered by DFFE. MTPA has the mandate for biodiversity matters on behalf of DARDLEA. As per my email to you below (3 August), hard copies of all reports must be submitted to Ms Mbuyane (Environmental Impact Management) at our Ermelo office, and the documents must be made available to me (and in this instance to Mr Cowden and Mr Lotter) electronically at the same time. You will need to contact Ms De Waal and Mr Krige at MTPA to confirm how documents must be submitted to MTPA. Please provide shape files of the 3 proposed WEFs as well.

Regards
Robyn

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	DESIGNATION	EMAIL	PHONE
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe Mbuyane	Deputy Director: EIM Gert Sibande District	mbuyanesb@mpg.gov.za	[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	
MTPA	**DESIGNATION**	**EMAIL**	**PHONE**
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za	
Khumbelo Malele	Land Use Advisor	Khumbelo.Malele@mtpa.co.za khumbelomalele@gmail.com	[redacted]
Celia de Waal	EIA Data Capturer LUA	celia.dewaal@mtpa.co.za	[redacted]

Please note that time frames for commenting on draft reports can only commence on the date that hard copies of the reports are received, and we request that our 30 day time frame aligns with DFFE's.

Kind Regards

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of

Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

EXTERNAL MESSAGE

Dear Lucien,

Our telephone discussion this morning refers.

I just wanted to confirm what we discussed in writing, ie. that MTPA and DARDLEA are different entities, and that MTPA and DARDLEA must each get reports for commenting. You confirmed that you dispatched documents to Ms Celia de Waal in Lydenburg last week (to arrive this week). Note that as per the table below, Ms de Waal will receive the documents for MTPA. DARDLEA must therefore still be provided with the documents. Hard copies to Ms Mbuyane at our Ermelo office, and a link to be sent to me. Please also send me the shapefiles. I have understood that you will be discussing this with your client and with Ms Gopaul, and that ERM would revert to me.

Please see page 2 of our application form attached where you will find the physical address of our Ermelo office (Gert Sibande District).

Kind Regards
Robyn

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	DESIGNATION	EMAIL	PHONE
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe Mbuyane	Deputy Director: EIM Gert Sibande District	mbuyanesb@mpg.gov.za	[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	
MTPA	**DESIGNATION**	**EMAIL**	**PHONE**
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za	
Khumbelo Malele	Land Use Advisor	Khumbelo.Malele@mtpa.co.za khumbelomalele@gmail.com	[redacted]
Celia de Waal	EIA Data Capturer LUA	celia.dewaal@mtpa.co.za	[redacted]

Please note that time frames for commenting on draft reports can only commence on the date that hard copies of the reports are received, and we request that our 30 day time frame aligns with DFFE's.

Kind Regards
Robyn

MPUMALANGA PROVINCE
REPUBLIC OF SOUTH AFRICA

Application for authorisation in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998), as amended and the Environmental Impact Assessment Regulations, 2014 (as amended)

	(For official use only)
File Reference Number:	
NEAS Reference Number:	
Date Received:	
Responsible Official:	

PROJECT TITLE

IMPORTANT INFORMATION

1. This application form is current as of 1 August 2023. It is the responsibility of the proponent to ascertain whether subsequent versions of the form have been published or produced by the competent authority.
2. Only a person registered as an environmental assessment practitioner may perform tasks in connection with an application for an environmental authorisation contemplated in Chapter 5 of NEMA, read with the Environmental Impact Assessment Regulations.
3. It is the responsibility of the proponent to confirm that DARDLEA is the competent authority to which this application must be submitted (refer to NEMA section 24C).
4. The required information must be typed within the spaces provided in the form. The sizes of the spaces provided are not necessarily indicative of the amount of information to be provided. Where applicable **black out** the boxes that are not applicable in the form.
5. The use of the phrase "not applicable" in the form must be done with circumspection.
6. This application form **must** be accompanied by a screening report generated through the national web-based environmental screening tool at https://screening.environment.gov.za/screeningtool.
7. No faxed or e-mailed applications will be accepted.
8. **Proof of payment of the applicable fee for consideration and processing of applications must accompany the submission of this form, unless an exclusion applies.** If an exclusion applies, a **written motivation** must be attached to this application form.
9. If the proponent is not the owner or person in control of the land on which the activity is to be undertaken, written consent from the landowner or person in control of the land must be obtained and must be attached to this application form, unless Regulation 39(2) applies.
10. The original signed declarations by the applicant and by the EAP and any specialist, which EAP and specialist meet all the requirements contemplated in Regulation 13, must accompany this application form. Where specialists and review EAPs/specialists are appointed after the submission of this form, the relevant declaration forms in Section 10 must be completed, and the original signed forms must accompany the draft basic assessment or the draft environmental impact assessment reports, as well as final reports to be submitted to this Department.
11. Unless protected by law, all information contained in this application will become public information on receipt by the Department. Upon request, the applicant/EAP must provide any interested and affected party with the information contained in or submitted with this application form.
12. Where exemption is intended to be applied for, such application must be made in terms of the National Exemption Regulations, 2014, and must be finalised before lodging an application for environmental authorisation.
13. If, in addition to this application, you must also apply for a Waste Management Licence in terms of the National Environmental Management: Waste Act, 2008 (Act No. 59 of 2008) and/or an Atmospheric Emission Licence in terms of the National

MPUMALANGA
THE PLACE OF THE RISING SUN

Environmental: Air Quality Act, 2004 (Act No. 39 of 2004, then separate application forms in terms of the applicable legislation must be completed and submitted to the relevant licensing authorities.

14. An application for environmental authorisation lapses if the applicant fails to meet any of the timeframes prescribed in terms of the 2014 EIA Regulations (as amended).

15. **DARDLEA has not prescribed a format for Basic Assessment, Scoping or Environmental Impact Assessment Reports, or Environmental Management Programmes.** Said reports must however contain all the information set out in Appendices 1, 2, 3 and 4 of the EIA Regulations respectively.

16. This form, and all subsequent reports, **MUST BE SUBMITTED TO THE DEPARTMENT AT THE RELEVANT DISTRICT OFFICE** given below. Should the application form not be submitted at the relevant district office, it will not be considered:

EHLANZENI DISTRICT	NKANGALA DISTRICT	GERT SIBANDE DISTRICT
Environmental Impact Management Riverside Office Park Aqua Street (opposite Audi) Building 4, East Tower Nelspruit 1200 Tel: 013 759 4000	Environmental Impact Management Piet Koornhof Building 1 Justice Street Witbank 1035 Tel: 087 260 6468 / 6481	Environmental Impact Management 13 De Jager Street Ermelo 2351 Tel: 017 811 4830
Please note that the addresses provide above are subject to change. It is the responsibility of the applicant / EAP to verify the abovementioned details with the relevant District Offices prior to submission of all application forms and reports.		

PROOF OF PAYMENT

Tick the appropriate box below to indicate that either proof of payment is attached or that, in the applicant's view, an exclusion applies. Proof and motivations for exclusions must be attached to this application form.

Proof of payment attached: ☐

Exclusion applies: ☐

An applicant is excluded from paying fees if:

- The activity is a community based project funded by a government grant; or
- The applicant is an organ of state

TYPE OF EXCLUSION	Tick which is applicable and attach proof / motivation
The activity is a community based project funded by a government grant	
The applicant is an organ of state	

FEE AMOUNT		
APPLICATION TYPE	**FEE**	**Tick which is applicable**
Application for an environmental authorisation for which basic assessment is required	**R2000**	
Application for an environmental authorisation for which S&EIR is required	**R10 000**	

Details for the payment of application fees

Banking Details:
Account name: Department of Agriculture, Rural Development, Land and Environmental Affairs
Bank: ABSA Bank
Account Type: Current Account
Account number: 4103095253
Branch Name: Business Bank

Beneficiary reference number: **EIM + ABBREVIATED PROJECT DESCRIPTION**

Proof of payment must be attached to this application form.

MPUMALANGA
THE PLACE OF THE RISING SUN

"Proof of payment" includes a receipt, a stamped deposit slip, electronic fund transfer copy or a payment advice.

NB: PAYMENT MUST BE MADE IN THE SAME MONTH THAT AN APPLICATION FORM IS TO BE SUBMITTED.

1. PROJECT TITLE

Provide a clear, accurate and detailed description of the development project and its associated infrastructure.

2. GENERAL INFORMATION

Applicant:			
Contact person:			
Physical address:			
Postal address:			
Postal code:		**Cell:**	
Telephone:		**Fax:**	
E-mail:			

In instances where there is more than one applicant, this section must be duplicated

Company name of EAP:			
EAP name and surname:			
Postal address:			
Postal code:		**Cell:**	
Telephone:		**Fax:**	
E-mail:			
Are you a Registered EAP in terms of 24H(3)(a) of NEMA (provide EAP Registration number):			

Landowner:			
Contact person:			
Postal address:			
Postal code:		**Cell:**	
Telephone:		**Fax:**	
E-mail:			

In instances where there is more than one landowner, this section must be duplicated.

District Municipality in whose jurisdiction the proposed activity will fall (Delete which is not applicable):	**Ehlanzeni**	**Nkangala**	**Gert Sibande**
Local authority in whose jurisdiction the proposed activity will fall:			
Nearest town:			

In instances where there is more than one local authority involved, this section must be duplicated.

3. SITE DESCRIPTION

Property description:	

(Farm name, portion, number and registration division or Erf number etc.) Where a large number of properties are involved (e.g. linear activities), please attach a full list to this application.

Current land-use zoning:	

In instances where there is more than one current land-use zoning, please attach a list of current land use zonings that also indicate which portions each use pertains to, to this application.

Property size (m^2) of all proposed sites:	
Development footprint size (m^2):	

Project map:	A project map must be attached to this document. The map must accurately provide an indication of the project site position as well as the positions of the alternative sites, if any, and • road names or numbers of all major roads as well as the roads that provide access to the site(s); • a north arrow; • any sensitive geographic features (eg. watercourses)

Site co-ordinates:

Indicate the position of the activity using the latitude and longitude of the centre point of the preferred site alternative. The co-ordinates must be in degrees, minutes and seconds using the Hartebeesthoek94 WGS84 co-ordinate system.

Latitude (S):			Longitude (E):		
0	‘	“	0	‘	“

In the case of linear activities:

- Starting point of the activity
- Middle point of the activity
- End point of the activity

Latitude (S):			Longitude (E):		
o	’	“	o	‘	“
o	‘	“	o	‘	“
o	‘	“	o	‘	“

SG 21 Digit Code(s):

Indicate all the Surveyor-General 21 digit codes for all sites (including portions of sites) that are part of the application. If there are more than 4, attach a list with the rest of the codes.

MPUMALANGA
THE PLACE OF THE RISING SUN

4. TYPE OF APPLICATION

4.1 Application for Basic Assessment

Is this an application for conducting a basic assessment (as defined in the Regulations)?	YES	NO

Please indicate when the final basic assessment report will be submitted:

4.2 Application for Scoping and Environmental Impact Assessment (S&EIR)

Is this an application for Scoping and EIR (as defined in the Regulations)?	YES	NO

Please indicate when the final Scoping Report (including the Plan of Study for EIA) will be submitted:

5. ACTIVITIES APPLIED FOR TO BE AUTHORISED

For an application for authorisation that involves more than one listed or specified activity that, together, make up one development proposal, all the listed activities pertaining to this application must be indicated.

Government Notice R983 (as amended) Activity No.	**Describe the relevant Basic Assessment Activity in writing as per Listing Notice 1 (GN No. R983, as amended)**	**Describe the extent to which the activity applied for requires authorisation (specify the threshold where applicable)**
Government Notice R985 (as amended) Activity No:	**Describe the relevant Basic Assessment Activity in writing as per Listing Notice 3 (GN No. R985, as amended)**	**Describe the extent to which the activity applied for requires authorisation (specify the threshold where applicable)**
Government Notice R984 Activity No:	**Describe the relevant Scoping and EIA Activity in writing as per Listing Notice 2 (GN No. R984)**	**Describe the extent to which the activity applied for requires authorisation (specify the threshold where applicable)**

Please note:
Only those activities listed above shall be considered for authorisation. The onus is on the applicant to ensure that all applicable listed activities are included in the application. Environmental Authorisation must be obtained prior to commencement with each applicable listed activity. If a specific listed activity is not included in an Environmental Authorisation, a new/separate application for Environmental Authorisation for such activity will have to be submitted.

6. PUBLIC PARTICIPATION

6.1 Public Participation undertaken to date

Where public participation in terms of Regulations 40, 41 and 42 was undertaken prior to submission of this application, please provide a summary of the steps followed to date. Please remember that in terms of Regulation 40(3), all potential or registered I&AP's **must** be provided with an opportunity to comment on draft reports once an application has been submitted to the CA.

6.2 State Departments identified in terms of S240

Provide a list of all State Departments / Organs of State that will be / have been consulted, and to whom draft reports will be submitted for comment. **Proof of submission / delivery of the draft report to all State Departments / Organs of State must be attached to the final BAR / S&EIR.**

Name of Department	Contact person	Address	Email Address	Phone number
Please note: In terms of Regulation (7)2, the EAP is responsible for consulting with all relevant State Departments / Organs of State in respect of the application (unless agreement to the contrary has been reached with the Department), and such State Departments must be provided with a 30 day comment period.				

7. OTHER AUTHORISATIONS

7.1 Do you need any authorisations in terms of the following legislation ?

National Environmental Management: Waste Act (NEMWA)	**YES**	**NO**
National Environmental Management: Air Quality Act (NEMAQA)	**YES**	**NO**
Have such applications been lodged already ?	**YES**	**NO**

If Yes, please attach proof of submission and provide a status update below. If no, then indicate when such applications will be submitted.

8. NATIONAL SECTOR CLASSIFICATION

Please indicate, by marking the appropriate box below, **the ONE sector** most applicable to the main development which forms the subject of this application

Infrastructure /Transport Services/Roads - Public		Services/Waste Management Services/Disposal facilities - Hazardous	
Infrastructure /Transport Services/Roads - Private		Services/Waste Management Services/Disposal facilities - Nuclear

Utilities Infrastructure/Telecommunications/ Radio Broadcasting - Receivers		Mining/Beneficiation - Mineral	
Utilities Infrastructure - Marine Cables		Agriculture/Forestry/ Fisheries - Crop Production	
Utilities Infrastructure/Electricity /Generation/Non Renewable/Hydrocarbon - Petroleum		Agriculture/Forestry/ Fisheries - Animal Production	
Utilities Infrastructure/Electricity /Generation/Non Renewable/Hydrocarbon - Coal		Agriculture/Forestry/ Fisheries - Afforestation	
Utilities Infrastructure/Electricity /Generation/Non Renewable - Nuclear		Agriculture/Forestry/ Fisheries - Aquaculture	
Utilities Infrastructure/Electricity /Generation/Renewable - Hydro		Agriculture/Forestry/ Fisheries - Agro-Processing	
Utilities Infrastructure/Electricity /Generation/Renewable/Solar - PV		Transformation of land - Indigenous vegetation	
Utilities Infrastructure/Electricity /Generation/Renewable/Solar - CSP		Transformation of land - From open space or Conservation	
Utilities Infrastructure/Electricity /Generation/Renewable - Wind		Transformation of land - From agriculture or afforestation	
Utilities Infrastructure/Electricity /Generation/Renewable - Biomass/ biofuels		Transformation of land - From mining or heavy industrial areas	
Utilities Infrastructure/Electricity /Generation/Renewable - Wave		Any activities within or close to a watercourse	
Utilities Infrastructure/Electricity /Distribution and Transmission - Power line		Any activity in an estuary, on the seashore, in the littoral active zone, or in the sea.	
Utilities Infrastructure/Electricity /Distribution and Transmission/Substation -		Activity requiring permit or licence in terms of National or Provincial legislation governing the release or generation of emissions - Emissions	
Release of Genetically Modified Organisms		Activity requiring permit or licence - Marine Effluent	
		Activity requiring permit or licence - Fresh Water Effluent	

8. CAPITAL VALUE AND JOB CREATION ESTIMATES (if applicable)

Capital value	**Job estimates**

9. LIST OF APPENDICES

		Submitted	
Appendix 1	Proof of payment, or	YES	N/A
	Written motivation where exclusion of payment applies	YES	N/A
Appendix 2	Land owner consent	YES	N/A
Appendix 3	Project map / plan	YES	N/A
Appendix 4	Screening Report	YES	NO

10. DECLARATIONS

10.1 The Applicant

Note: Duplicate this section where there is more than one applicant.

I……., in my personal capacity or duly authorised thereto hereby declare/affirm all the information submitted or to be submitted as part of the application is true and correct, and that I:

- am fully aware of my responsibilities in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) ("NEMA"), the Environmental Impact Assessment Regulations ("EIA Regulations") in terms of NEMA (Government Notice No. R. 982 refers) and any relevant specific environmental management act and that failure to comply with these requirements may constitute an offence in terms of relevant environmental legislation;
- appointed the environmental assessment practitioner and/or specialists, where applicable, which EAP and/or specialists meet all the requirements in terms of regulation 13 of GN No. R 982 to act as independent environmental assessment practitioner for this application;
- will provide the EAP, specialists and the competent authority with access to all information at my disposal that is relevant to the application;
- will be responsible for the costs incurred in complying with the NEMA EIA Regulations, 2014 and other environmental legislation including but not limited to –
  - costs incurred in connection with the appointment of the environmental assessment practitioner or any person contracted by the environmental assessment practitioner;
  - costs incurred in respect of independent reviews in terms of regulation 13(2) of GN No. R982;
  - costs incurred in respect of the undertaking of any process required in terms of the regulations;
  - costs in respect of any fee prescribed by the Minister or MEC in respect of the regulations;
  - costs in respect of specialist reviews, if the competent authority decides to recover costs; and
  - the provision of security to ensure compliance with applicable management and mitigation measures;
- am responsible for complying with conditions that may be attached to any decision(s) issued by the competent authority;
- will ensure that the environmental assessment practitioner is competent to comply with the requirements of the EIA Regulations, 2014;
- hereby indemnify the government of the Republic, the competent authority and all its officers, agents and employees, from any liability arising out of the content of any report, any procedure or any action for which the applicant or environmental assessment practitioner is responsible in terms of the NEMA EIA Regulations, 2014 and any specific environmental management act; and
- will not hold the competent authority responsible for any costs that may be incurred by the applicant in proceeding with an activity prior to an appeal being decided in terms of the NEMA Regulations, 2014.

Note: If acting in a representative capacity, a certified copy of the resolution or power of attorney must be attached.

10.2 The Environmental Assessment Practitioner (EAP)

I ....., as the appointed environmental assessment practitioner ("EAP") hereby declare/affirm the correctness of the information provided or to be provided as part of the application, and that I:

- in terms of the general requirement to be independent (tick which is applicable):

	other than fair remuneration for work performed/to be performed in terms of this application, have no business, financial, personal or other interest in the activity or application and that there are no circumstances that may compromise my objectivity; or

	am not independent, but another EAP that is independent and meets the general requirements set out in Regulation 13 has been appointed to review my work (Note: a declaration by the review EAP must be submitted);

- have expertise in conducting environmental impact assessments, including knowledge of the Act, regulations and any guidelines that have relevance to the proposed activity;
- will ensure compliance with the EIA Regulations 2014;
- will perform the work relating to the application in an objective manner, even if this results in views and findings that are not favourable to the application;
- will take into account, to the extent possible, the matters listed in regulation **18** of the regulations when preparing the application and any report, plan or document relating to the application;
- will disclose to the proponent or applicant, registered interested and affected parties and the competent authority all material information in my possession that reasonably has or may have the potential of influencing any decision to be taken with respect to the application by the competent authority or the objectivity of any report, plan or document to be prepared by myself for submission to the competent authority (unless access to that information is protected by law, in which case I will indicate that such protected information exists and is only provided to the competent authority);
- will ensure that information containing all relevant facts in respect of the application is distributed or made available to interested and affected parties and the public and that participation by interested and affected parties is facilitated in such a manner that all interested and affected parties will be provided with a reasonable opportunity to participate and to provide comments on documents that are produced to support the application;
- declare that all the particulars furnished by me in this form are true and correct;
- am aware that it is an offence in terms of Regulation 48 to provide incorrect or misleading information and that a person convicted of such an offence is liable to the penalties as contemplated in section 49B(2) of the National Environmental Management Act, 1998 (Act 107 of 1998).

Hi Robyn,

Thank you for your call earlier. I wanted to inform you that we sent out the notification to all IAPs on July 19th, 2024. We are currently in the process of couriering the Draft Scoping Reports to Sindiswe Mbuyane in Ermelo.
We would greatly appreciate it if you could review the reports within the current PPP period. Additionally, we have added you to the IAP database for the Full Scoping and EIA Phase to afford you an opportunity to comment. We are keen to have you onboard and to ensure that you are up to speed with the proposed project, we would be happy to set up a call at your convenience.

We understand that you may not have received the reports yet, but if you could review them at your earliest convenience, it would be greatly appreciated. Below is a link to the electronic copies of the reports and attached the shapefiles of the development for your review.

https://www.erm.com/public-information-sites/proposed-amsterdam-wind-energy-facility-and-auxiliary-infrastructure-cluster-mpumalanga/

Please let me know if you would like to discuss this further or if you have any questions.

Importance: High

EXTERNAL MESSAGE

Dear Lucien,

Our telephone discussion this morning refers.

I just wanted to confirm what we discussed in writing, ie. that MTPA and DARDLEA are different entities, and that MTPA and DARDLEA must each get reports for commenting. You confirmed that you dispatched documents to Ms Celia de Waal in Lydenburg last week (to arrive this week). Note that as per the table below, Ms de Waal will receive the documents for MTPA. DARDLEA must therefore still be provided with the documents. Hard copies to Ms Mbuyane at our Ermelo office, and a link to be sent to me. Please also send me the shapefiles. I have understood that you will be discussing this with your client and with Ms Gopaul, and that ERM would revert to me.

Please see page 2 of our application form attached where you will find the physical address of our Ermelo office (Gert Sibande District).

Kind Regards
Robyn

Robyn Luyt B.A., B.Sc., B.Sc (Hons) M.Sc., Pr.Sci.Nat. (400327/11), EAPASA (2019/1293)

Good day,

Please see my email response to you on 7 August as per below email thread. I have not had a response and we still await the draft reports for commenting. Please urgently advise how this is being addressed. I have just had an email from MTPA stating that you are busy sending them the draft reports. Please confirm when I will receive a link to the reports, and when our Ms Mbuyane will receive the hard copies. Please also confirm that we (both DARDLEA and MTPA) will be provided with the mandatory 30 days to comment.

Should you wish to discuss this further please call me on 0826727868.

Regards
Robyn

>>> Robyn Luyt 08/07/24 9:41 AM >>>
Good day Stephanie,

Be advised that the names of the officials at MTPA that you have highlighted in your below notification are**not the relevant officials** that are required to be notified or the relevant officials that must review and comment on draft Scoping or EIA reports, or any reports related to an EIA process. There are also no officials in the list of officials in your screenshots that are in the Environmental Affairs Chief Directorate in MDARDLEA - as far as I am aware they are in the section that deals with Agriculture, which is an entirely different mandate.

It would **not**be acceptable to not provide the commenting authority the mandatory 30 days to review and comment on draft reports, especially in light of the fact that there has been no prior notification. The Directorate Environmental Impact Management within DARDLEA represents the MEC as Competent Authority in Mpumalanga, and the commenting authority in respect projects administered

by DFFE. MTPA has the mandate for biodiversity matters on behalf of DARDLEA. As per my email to you below (3 August), hard copies of all reports must be submitted to Ms Mbuyane (Environmental Impact Management) at our Ermelo office, and the documents must be made available to me (and in this instance to Mr Cowden and Mr Lotter) electronically at the same time. You will need to contact Ms De Waal and Mr Krige at MTPA to confirm how documents must be submitted to MTPA. Please provide shape files of the 3 proposed WEFs as well.

Regards
Robyn

Subject: Consultation | Mlulio Wind Farms Mpumalanga
Importance: High

You don't often get email fromrluyt@mpg.gov.za.Learn why this is important

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the

draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	**DESIGNATION**	**EMAIL**	**PHONE**
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe Mbuyane	Deputy Director: EIM Gert Sibande District	mbuyanesb@mpg.gov.za	[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	
MTPA	**DESIGNATION**	**EMAIL**	**PHONE**
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za	
Khumbelo Malele	Land Use Advisor	Khumbelo.Malele@mtpa.co.za khumbelomalele@gmail.com	[redacted]
Celia de Waal	EIA Data Capturer LUA	celia.dewaal@mtpa.co.za	[redacted]

Please note that time frames for commenting on draft reports can only commence on the date that hard copies of the reports are received, and we request that our 30 day time frame aligns with DFFE's.

Kind Regards
Robyn

ERM Verwysing: 0684401

Geagte Belanghebbende en Geaffekteerde Party, Belanghebbende, Staats orgaan

KENNISGEWING VAN BESKIKBAARHEID VAN DIE KONSEP-OMVANGS VERSLAE VIR OPENBARE HERSIENING EN KOMMENTAAR VAN DIE VOORGESTELDE AMSTERDAM WIND ENERGIE FASILITEIT (EMVELO, ROCHDALE EN SHEEPMOOR) CLUSTER, NABY ERMELO, MPUMALANGA

Kennis word hiermee gegee van 'n openbare deelname proses (ODP) wat in gevolge die Wet op Nasionale Omgewingsbestuur, 1998 (Wet No. 107 van 1998) (NEMA, 1998), soos gewysig, onderneem moet word.

DFFE-verwysing(s): Om bevestig te word

Aard van aktiwiteit: Emvelo Windenergie fasiliteit Bpk, Rochdale Windenergie fasiliteit Bpk en Sheepmoor Windenergie fasiliteit Bpk ('die Projek aansoekers') stel voor dat drie (3) Wind energie fasiliteite (WEF) opgerig en bedryf word. Die potensiële opwekkingsvermoë van Emvelo WEF is tot 200 MW, Rochdale WEF is tot 220 MW en Sheepmoor tot 360 MW. Elke WEF sal bestaan uit verskeie geboue, toegangspaaie, 'n battery-energieberging stelsel (BESS) en 'n substasie naaf met gepaardgaande elektriese netwerk infrastruktuur soos, maar nie beperk tot 'n 132kV oorhoofse transmissie kraglyn wat die WEF met die nasionale elektriese netwerk verbind.

Ontwikkelings ligging: Die voorgestelde Amsterdam WEF se cluster is 30 km oos van Ermelo binne die Msukaligwa Plaaslike Munisipaliteit en Gert Sibande Distriksmunisipaliteit geleë.

Aansoek proses: Ingevolge Hoofstuk 5 van die Wet op Nasionale Omgewingsbestuur, 1998 (Wet 107 van 1998 – NEMA), Omgewings Impak studie (EIA) Regulasies, 2014 (soos gewysig), het die Projek aansoekers, Environmental Resources Management (Edms) Bpk (ERM) aangestel om as projek bestuurder op te tree en die Omvang- en Omgewings Impak bepalings prosesse (S&EIA) as die onafhanklike omgewings impak bepalings praktisyn (EAP) te onderneem.

ERM het drie afsonderlike omgewings aansoeke ingedien, waaronder afsonderlike konsep-omvang verslae aan die departement van bosbou, visserye en die omgewing (DFFE).

Uitnodiging om kommentaar te lewer: Lede van die publiek, plaaslike gemeenskappe en belanghebbendes word uitgenooi om kommentaar te lewer op die konsep-omvang verslae, wat beskikbaar is vir openbare hersiening en kommentaar, vanaf **Vrydag, 19 Julie 2024 tot die 20 Augustus 2024 (albei dae ingesluit),** soos per Tabel 1 hieronder.

ERM Reference: 0684401

Dear Interested and Affected Party, Stakeholder, Organ of State

NOTIFICATION OF AVAILABILITY OF THE DRAFT SCOPING REPORTS FOR PUBLIC REVIEW AND COMMENT OF THE PROPOSED AMSTERDAM WIND ENERGY FACILITY (EMVELO, ROCHDALE AND SHEEPMOOR) CLUSTER, NEAR ERMELO, MPUMALANGA

Notice is hereby given of a Public Participation Process (PPP) to be undertaken in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA, 1998), as amended.

DFFE Reference(s): To Be Confirmed

Nature of Activity: Emvelo Wind Energy Facility (Pty) Ltd, Rochdale Wind Energy Facility (Pty) Ltd and Sheepmoor Wind Energy Facility (Pty) Ltd ('the Project Applicants') are proposing the construction and operation of three (3) Wind Energy Facilities (WEF). The potential generation capacity of Emvelo WEF is up to 200 MW, Rochdale WEF is up to 220 MW and Sheepmoor up to 360 MW. Each WEF will comprise various buildings, access roads, a battery energy storage system (BESS), and a substation hub with associated electrical grid infrastructure such as but not limited to a 132kV overhead transmission powerline connecting the WEF to the national electrical grid network.

Development Location: The proposed Amsterdam WEF's Cluster are located 30 km east of Ermelo within the Msukaligwa Local Municipality, and Gert Sibande District Municipality.

Application Process: In terms of Chapter 5 of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA), Environmental Impact Assessment (EIA) Regulations, 2014 (as amended), the Project Applicants appointed Environmental Resources Management (Pty) Ltd (ERM), to act as the project manager and to undertake the Scoping and Environmental Impact Assessment (S&EIA) processes as the independent environmental impact assessment practitioner (EAP).

ERM has submitted three separate Environmental Applications, including separate Draft Scoping Reports to the Department of Forestry, Fisheries and the Environment (DFFE).

Invitation to Comment: Members of the public, local communities, and stakeholders are invited to comment on the Draft Scoping Reports, which is available for public review and comment, from **Friday, 19 July 2024 to the 20 August 2024 (both days inclusive)**, as per Table 1 below.

Post: Postnet Suite 90, Private Bag X12, Tokai, 7966	**Online:** https://mulilowef.aidaform.com/public-participation-form

Following the 30-day public participation, the comments will be addressed and incorporated into the Final Scoping Reports, which will be submitted to the DFFE for approval to progress to the EIA Phase.

Please note, regarding the Protection of Personal Information Act (PoPI Act 4 of 2013, as amended): If you request to register as an I&AP, your personal information will be made available to an appellant in the case of an appeal, and an applicant/EAP/independent person for purposes of being informed and given access to an audit report.

Correspondence throughout the Application Process will only be distributed to Registered I&APs. Registration is possible throughout the Application Process.

Thank you for the interest in the project.

EXTERNAL MESSAGE

Goodday Lucien

14/12/16/3/3/2/2591: THE PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

14/12/16/3/3/2/2592: THE PROPOSED DEVELOPMENT OF THE ROCHDALE WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, INCLUDING A GRID CONNECTION, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

14/12/16/3/3/2/2593: THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The application and draft Scoping Report (SR) for Environmental Authorisation received by the Department on 22 July 2024 refers.

Following our telephone conversation earlier today regarding the public participation process, please be informed that comments on the draft Scoping Report (SR) are due to you on 22 August 2024. It is noted that there are organs of state who have jurisdiction in respect of the proposed activity, which requires that they be added to the I&AP Database and given an opportunity to comment on the draft SR.

The applicant is requested to submit the final SR to the Department on or before the due date (05 September 2024) and may submit comments from MTPA and DARDLEA as addendums, subsequent to the submission of the final SR to the Department.

MTPA and Mpumalanga DARDLEA are requested to cc this Department when submitting comments to the EAP.

Kind regards
Ms Bathandwa Ncube (EAPASA)

Hi Bheki,

Our telephonic discussion earlier refers. Understandably, you mentioned IT related issues in terms of receiving e-mails and forwarding them, hence I have copied your gmail address as requested.

Please see below notification that was sent on the 19th of July 2024.

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

Each WEF will comprise various buildings, access roads, a battery energy storage system (BESS), and a substation hub with associated electrical grid infrastructure such as but not limited to a 132kV overhead transmission powerline connecting the WEF to the national electrical grid network.

Development Location: The proposed Amsterdam WEF's Cluster are located 30 km east of Ermelo within the Msukaligwa Local Municipality, and Gert Sibande District Municipality.

Application Process: In terms of Chapter 5 of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA), Environmental Impact Assessment (EIA) Regulations, 2014 (as amended), the Project Applicants appointed Environmental Resources Management (Pty) Ltd (ERM), to act as the project manager and to undertake the Scoping and Environmental Impact Assessment (S&EIA) processes as the independent environmental impact assessment practitioner (EAP).

ERM has submitted three separate Environmental Applications, including separate Draft Scoping Reports to the Department of Forestry, Fisheries and the Environment (DFFE).

Invitation to Comment: Members of the public, local communities, and stakeholders are invited to comment on the Draft Scoping Reports, which is available for public review and comment, from **Friday, 19 July 2024 to the 20 August 2024 (both days inclusive)**, as per Table 1 below.

The application and draft Scoping Report (SR) for Environmental Authorisation received by the Department on 22 July 2024 refers.

Following our telephone conversation earlier today regarding the public participation process, please be informed that comments on the draft Scoping Report (SR) are due to you on 22 August 2024. It is noted that there are organs of state who have jurisdiction in respect of the proposed activity, which requires that they be added to the I&AP Database and given an opportunity to comment on the draft SR.

The applicant is requested to submit the final SR to the Department on or before the due date (05 September 2024) and may submit comments from MTPA and DARDLEA as addendums, subsequent to the submission of the final SR to the Department.

MTPA and Mpumalanga DARDLEA are requested to cc this Department when submitting comments to the EAP.

EXTERNAL MESSAGE

Good Morning all,

I am extremely concerned with the agreement reached between ERM and DFFE. DARDLEA, as the Provincial Department responsible for environmental affairs in Mpumalanga Province, **has to date not yet received any of the draft documents for review and comment.** In accordance with the requirements of Regulation 40(1)(b), the scoping report is required to be subjected to all I&APs for a period of at least 30 days for comment. Further to this, Regulation 40(2)(b) states that the public participation process must provide access to all information ...and must include consultation with every State department that administers a law relating to a matter affecting the environment relevant to an application for an environmental authorisation.

Regulation 21(1) is very clear in the requirement that a final Scoping Report must, within 44 days of submitting an application to the CA, be submitted to the CA (ie. DFFE), which report has been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received. The arrangement below is not in line with this requirement, which amounts to an administrative flaw, and I fail to see how DFFE would be in a position to consider a final Scoping report that does not include the input from DARDLEA. The arrangement would also preclude the requirement for the applicant to incorporate the comments received from DARDLEA into the final Scoping report.

As stated above, DARDLEA still awaits the documents for comment.

Kind Regards
Robyn

Hi Masina,

Thank you for your call earlier.

As discussed, ERM sent out the notification to the Mpumalanga Tourism and Parks Agency, as well as the Mpumalanga Province Department of Agriculture, Rural Development, Land, and Environmental Affairs on July 19th.

Unfortunately, Mr. Bheki Nyathikazi has been experiencing IT-related issues with his mailbox, which have impacted his ability to receive and forward emails. To address this, I have resent the notification to his Gmail account to ensure it can be forwarded for relevant circulation.

Please let me know if there are any additional actions needed or if you require further information.

Best regards,

ERM

Hi Bheki,

Our telephonic discussion earlier refers. Understandably, you mentioned IT related issues in terms of receiving e-mails and forwarding them, hence I have copied your gmail address as requested.

Please see below notification that was sent on the 19th of July 2024.

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

ERM Verwysing: 0684401

Geagte Belanghebbende en Geaffekteerde Party, Belanghebbende, Staats orgaan

KENNISGEWING VAN BESKIKBAARHEID VAN DIE KONSEP-OMVANGS VERSLAE VIR OPENBARE HERSIENING EN KOMMENTAAR VAN DIE VOORGESTELDE AMSTERDAM WIND ENERGIE FASILITEIT (EMVELO, ROCHDALE EN SHEEPMOOR) CLUSTER, NABY ERMELO, MPUMALANGA

Kennis word hiermee gegee van 'n openbare deelname proses (ODP) wat in gevolge die Wet op Nasionale Omgewingsbestuur, 1998 (Wet No. 107 van 1998) (NEMA, 1998), soos gewysig, onderneem moet word.

DFFE-verwysing(s): Om bevestig te word

Aard van aktiwiteit: Emvelo Windenergie fasiliteit Bpk, Rochdale Windenergie fasiliteit Bpk en Sheepmoor Windenergie fasiliteit Bpk ('die Projek aansoekers') stel voor dat drie (3) Wind energie fasiliteite (WEF) opgerig en bedryf word. Die potensiële opwekkingsvermoë van Emvelo WEF is tot 200 MW, Rochdale WEF is tot 220 MW en Sheepmoor tot 360 MW. Elke WEF sal bestaan uit verskeie geboue, toegangspaaie, 'n battery-energieberging stelsel (BESS) en 'n substasie naaf met gepaardgaande elektriese netwerk infrastruktuur soos, maar nie beperk tot 'n 132kV oorhoofse transmissie kraglyn wat die WEF met die nasionale elektriese netwerk verbind.

Ontwikkelings ligging: Die voorgestelde Amsterdam WEF se cluster is 30 km oos van Ermelo binne die Msukaligwa Plaaslike Munisipaliteit en Gert Sibande Distriksmunisipaliteit geleë.

Aansoek proses: Ingevolge Hoofstuk 5 van die Wet op Nasionale Omgewingsbestuur, 1998 (Wet 107 van 1998 – NEMA), Omgewings Impak studie (EIA) Regulasies, 2014 (soos gewysig), het die Projek aansoekers, Environmental Resources Management (Edms) Bpk (ERM) aangestel om as projek bestuurder op te tree en die Omvang- en Omgewings Impak bepalings prosesse (S&EIA) as die onafhanklike omgewings impak bepalings praktisyn (EAP) te onderneem.

ERM het drie afsonderlike omgewings aansoeke ingedien, waaronder afsonderlike konsep-omvang verslae aan die departement van bosbou, visserye en die omgewing (DFFE).

Uitnodiging om kommentaar te lewer: Lede van die publiek, plaaslike gemeenskappe en belanghebbendes word uitgenooi om kommentaar te lewer op die konsep-omvang verslae, wat beskikbaar is vir openbare hersiening en kommentaar, vanaf **Vrydag, 19 Julie 2024 tot die 20 Augustus 2024 (albei dae ingesluit),** soos per Tabel 1 hieronder.

Tabel 1: Liggings vir openbare oorsig en kommentaar

Ligging	Fisiese adres

Marinda Rasmussen

Harde kopie ligging	
Ermelo Openbare Biblioteek	Ermelo, 2350
CD-kopieë sal op versoek aan die EAP gemaak word.	

Indien u as 'n I&AP geregistreer wil wees en / of kommentaar wil lewer, dien asseblief u naam, belangstelling in die projek of kommentaar, e-pos adres en pos adres en telefoon nommer skriftelik by die onderstaande adres in:	
Environmental Resources Management Southern Africa (Edms) Bpk	
Projek verwysing: 0684401 Mulilo WEF-cluster	**Kontak persoon:** Lucien Barbeau
E-pos: ERM.ArcusAmsterdam@erm.com	**Telefoon:** +27117985400
Pos: Postnet Suite 90, Privaatsak X12, Tokai, 7966	**Aanlyn:**https://mulilowef.aidaform.com/public-participation-form

Na afloop van die openbare deelname van 30 dae, sal die kommentaar aangespreek en opgeneem word in die Finale Omvang verslae, wat aan die DFFE voorgelê sal word vir goedkeuring om na die EIA-fase te vorder.

Let wel, met betrekking tot die Wet op die Beskerming van Persoonlike Inligting (PoPI Wet 4 van 2013, soos gewysig): Indien u versoek om as 'n I&AP te registreer, sal u persoonlike inligting aan 'n appel kandidaat beskikbaar gestel word in die geval van 'n appèl, en 'n aansoeker/EAP/onafhanklike persoon vir doeleindes daarvan om ingelig te word en toegang tot 'n ouditverslag te kry.

Korrespondensie gedurende die aansoek proses sal slegs aan geregistreerde I &AP's versprei word. Registrasie is moontlik gedurende die aansoek proses.

Dankie vir die belangstelling in die projek.

ERM Reference: 0684401

Dear Interested and Affected Party, Stakeholder, Organ of State

NOTIFICATION OF AVAILABILITY OF THE DRAFT SCOPING REPORTS FOR PUBLIC REVIEW AND COMMENT OF THE PROPOSED AMSTERDAM WIND ENERGY FACILITY (EMVELO, ROCHDALE AND SHEEPMOOR) CLUSTER, NEAR ERMELO, MPUMALANGA

Notice is hereby given of a Public Participation Process (PPP) to be undertaken in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA, 1998), as amended.

DFFE Reference(s): To Be Confirmed

Nature of Activity: Emvelo Wind Energy Facility (Pty) Ltd, Rochdale Wind Energy Facility (Pty) Ltd and Sheepmoor Wind Energy Facility (Pty) Ltd ('the Project Applicants') are proposing the construction and operation of three (3) Wind Energy Facilities (WEF). The potential generation capacity of Emvelo WEF is up to 200 MW, Rochdale WEF is up to 220 MW and Sheepmoor up to 360 MW. Each WEF will comprise various buildings, access roads, a battery energy storage system (BESS), and a substation hub with associated electrical grid infrastructure such as but not limited to a 132kV overhead transmission powerline connecting the WEF to the national electrical grid network.

Development Location: The proposed Amsterdam WEF's Cluster are located 30 km east of Ermelo within the Msukaligwa Local Municipality, and Gert Sibande District Municipality.

Application Process: In terms of Chapter 5 of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA), Environmental Impact Assessment (EIA) Regulations, 2014 (as amended), the Project Applicants appointed Environmental Resources Management (Pty) Ltd (ERM), to act as the project manager and to undertake the Scoping and Environmental Impact Assessment (S&EIA) processes as the independent environmental impact assessment practitioner (EAP).

ERM has submitted three separate Environmental Applications, including separate Draft Scoping Reports to the Department of Forestry, Fisheries and the Environment (DFFE).

Invitation to Comment: Members of the public, local communities, and stakeholders are invited to comment on the Draft Scoping Reports, which is available for public review and comment, from **Friday, 19 July 2024 to the 20 August 2024 (both days inclusive)**, as per Table 1 below.

EXTERNAL MESSAGE

Good day Stephen and Lucien,

I trust you had a good long weekend.

Following up on my mail below. By when should we expect to receive the Final Scoping reports for review?
Could I please request that the Final Scoping Reports be provided for review by COB on Wednesday?
Please note the tight timelines related to this project.

Kind Regards,

Lloyd Barnes

Subject: Amsterdam WEF Final Scoping prep

Good day ERM team,

Please see the attached updated layout to be considered for Final Scoping.
Please may you review the layout and raise any questions or queries if necessary.

Please note that as a result of the Enviro sensitivities, we have to drop Rochdale, and merge the properties with the Emvelo application.

Please may you confirm by when you will be able to provide first drafts of the Final Scoping reports for our review.

The application and draft Scoping Report (SR) for Environmental Authorisation received by the Department on 22 July 2024 refers.

Following our telephone conversation earlier today regarding the public participation process, please be informed that comments on the draft Scoping Report (SR) are due to you on 22 August 2024. It is noted that there are organs of state who have jurisdiction in respect of the proposed activity, which requires that they be added to the I&AP Database and given an opportunity to comment on the draft SR.

The applicant is requested to submit the final SR to the Department on or before the due date (05 September 2024) and may submit comments from MTPA and DARDLEA as addendums, subsequent to the submission of the final SR to the Department.

MTPA and Mpumalanga DARDLEA are requested to cc this Department when submitting comments to the EAP.

Kind regards

Ms Bathandwa Ncube (EAPASA)
Department of Forestry, Fisheries and the Environment (DFFE)

Subject: RE: Response on request sent to Surgeon

Dear Sindy,

Thank you getting in contact. Arcus (an ERM group company) have been appointed by a

Developer to undertake the EIA process for 3 proposed WEFs near Ermelo in the Mpumalanga Province. During the pre-application meeting with the National Department (DFFE), we have been advised that the Provincial Authority, in this case, Mpumalanga Department: Agriculture, Rural Development, Land and Environmental Affairs, will be the Competent Authority for the 3 proposed Applications for EA of the Associated Grid Infrastructure for the 3 Proposed WEFs.

In terms of regional locality, the proposed WEFs are located between the town of Ermelo and Amsterdam, and falls within the Msukaligwa Local Municipality and the Gert Sibande District Municipality, in the Mpumalanga Province

Please could you confirm that your directorate is responsible for this proposed application, and if the meeting can take place via MS Teams or Zoom. Once confirmed we will provide 3 proposed dates and times for the meeting.

Looking forward to your response and assistance.

Please do not hesitate to contact the undersigned should you have any questions.

Thank You

Kind Regards

ORGANISATION	COMMENT RAISED	NOTES / RESPONSES / ACTIONS	PERSON	DUE DATE
WELCOME AND MEETING PURPOSE				
ERM	AAL welcomed attendees, and all present introduced themselves and their roles in the proposed development application process.	Please refer to Appendix A for a copy of the attendance register as downloaded from MS Teams after the meeting.	-	-
ERM	For minute purposes, the meeting was recorded using the MS Teams record option.	Please refer to Appendix B for a copy of the presentation.	-	-
ERM	AAL listed the meeting agenda.	No objections were raised to the meeting agenda.	-	-
ERM	AAL explained the meeting must be considered a formal consultation. AAL confirmed the purpose of the meeting.	The meeting was considered a formal consultation in terms of the requirements as stipulated in the Environmental Impact Assessment Regulations, 2014 (as amended), as promulgated in terms of the Nation Environmental Management ACT, 1998 (Act No. 107 of 1998) (NEMA). The purpose of this meeting is to discuss the Application(s) for Environmental Authorisation of the Associated Infrastructures for the proposed WEF Cluster in the Mpumalanga Province in terms of Regulation 31 and 32 of the NEMA EIA Regulations, 2014 (as amended).	-	-
PROJECT LOCALITY, SPECIFICATIONS AND MOTIVATION FOR THE MULILO WEF APPLICATIONS				
ERM	The project locality was explained and presented in a map to all attendees.	The project locality was explained (The proposed WEFs is located between 15-30 km east of the town of Ermelo in the Mpumalanga Province, South Africa. It falls within the Msukaligwa local municipality and Gert Sibande district municipality) and a map was presented to the attendees. The proposed grid infrastructure was presented. Each WEF has 1 preferred and 3 alternative OHPL routes (4 in total to be assessed in a 300 m corridor). Four slides of maps were shown to the attendees. Slide 1 presented the Mulilo WEF cluster location. Slide 2 to 4 presented each WEF and associated infrastructure individually.	-	-
ERM	The technical specifications of the proposed developments were presented.	Technical specifications were presented in table format. Three WEFs (proposed facilities) were outlined according to project name, applicant, total MW, number of turbines, proximity to Eskom Camden Substation (SS). Each Mulilo WEF will be	-	-

 S.B

ORGANISATION	COMMENT RAISED	NOTES / RESPONSES / ACTIONS	PERSON	DUE DATE
		applied for in separate Application forms, including accompanying assessment reports – 3 Applications for Scoping and EIA Process equals 3 EAs. The grid connection for each WEF will be applied for in a separate application – 3 applications following a Basic Assessment (BA) process equals 3 EAs.		
ERM	The motivation for the proposed development was explained to the DFFE.	Developer intends to bid the facilities in the seventh bidding window of the REIPPPP (Renewable Energy Independent Power Producer Procurement Programme) with the aim of evacuating the generated power from the WEFs into the National Eskom Grid. Aid in the diversification and stabilisation of the country's electrical supply in line with the objective of the IRP.	-	-
LEGISLATIVE FRAMEWORK AND PUBLIC PARTICIPATION PROCESS				
ERM	Legislative Framework and Public Participation Process was outlined to DFFE, including consideration of the Directions of 5 June 2020 regarding the COVID-19 Pandemic, i.e., to submit the Applications electronically to the DFFE.	Application for the BA will be in accordance with the EIA Regulations of December 2014 as amended, published in terms of regulation 31 and 32 NEMA, 1998. The project process will be: initiation and review, public participation, reporting and decision-making phase.	-	-
ERM	Public participation process.	Initial phase public consultation includes site notices, poster notices at local stores in the town of Ermelo and Amsterdam and email notification to the pre-identified I&APs. The EAP will conduct a PP process during the draft phase in accordance with Chapter 6 of the EIA regulations, 2017 as amended, and the PP guidelines.	-	-
SPECIALIST REPORTING AND TEAM				
ERM	Site visits will be / has been conducted by specialists, as required, following the requirement of GN 43110 of NEMA: Environmental Themes Reporting Criteria and the Relevant Protocols Gazetted.	DFFE screening reports were sent to all specialists. Specialists' will produce separate BA reports which will consider the results of the screening reports. The 12-month bird monitoring is currently in process and will conclude following the winter season 2023. All specialist visits will be conducted following the requirements of the protocols and any other relevant guidelines applicable.	-	-

S.B

ORGANISATION	COMMENT RAISED	NOTES / RESPONSES / ACTIONS	PERSON	DUE DATE
DISCUSSIONS / QUESTIONS/ GENERAL TOPICS				
MPG	SM queried with the project team if the national department was consulted to establish if they are not the competent authority ('CA'). If not, the provincial authority would process the applications	LB responded that the development will be handed over to Eskom once approved. The initial strategy was for the national department to act as the CA as they are the CA for the WEF applications and it would have made sense for one CA to authorise for one project. The national department did acknowledge the preference however stated that a pre application meeting would still be required with the provincial department as the provincial department would decide if they want to be the CA or allow for the national department to be the CA.		-
MPG	SM informed the project team that the Mpumalanga Department is in the process of writing a request to the Minister to deal with these applications. Therefore, all the applications might go to the national department. If the national department says the provincial department must decide, the provincial department cannot decline the challenge of exposure to other environmental aspect that come with the project. The application can be submitted to the provincial department but note that the applications might be delegated to the national department especially those transferred to Eskom.	LB confirmed that the applications will be transferred to Eskom. He queried that now knowing about the delegation letter, in the interest of time would it not be better submit the applications to the national authority to ensure that the project developers can meet the different deadlines to get all project components authorised at the same time. On a case-by-case basis, the provincial department can request the national department to be the component authority. He expressed concern that the decision making of who the CA is, might cause delays on the Applications.		-
MPG	SM commented that she does not think there will be any delays if the application is submitted to the provincial authority. They will be advised to process the application and not undertake more applications. Alternatively, if the national department is the CA, then the provincial department can be a commenting authority.	LB responded that his concern was if there were changes after submitting the application however he is happy to submit the applications and have them continue with one CA. SM stated that they hope there will not be a need to send the applications to the national department if they are done by the provincial government.		-
Mulilo	LB queried that in terms of the application, the developers would like to have the proposed route, the layout and EMPr approved with the environmental authorisation to avoid doing future processes. Having the layout approved at the planning stage is sometimes tricky so is there anything that can be done to out the project developers in a good position to have the layout approved?	SM responded that what would assist is contacting Mpumalanga Tourism and Parks agency since they are the main custodians of biodiversity in Mpumalanga and their guidelines will provide guidance on avoiding biodiversity sensitive areas. As well as BirdLife SA for any birds that might be present in the area.		-

ORGANISATION	COMMENT RAISED	NOTES / RESPONSES / ACTIONS	PERSON	DUE DATE
Mulilo	LB stated that one year monitoring is already being conducted for birds and bats. All the specialists have been to site recently to identify any sensitivities and those two I&APs will be identified and notified. By obtaining comments from them, it puts the project in a good position to obtain approval for final layout	SM confirmed that they will be able to assist with avoiding biodiversity sensitive areas. SM also advised including national department of rural development and land reform for agricultural fields, and the Gert Sibande District Municipality.		-
ERM	AAL asked that if SM has more people who can be included on the I&AP database to please let the project team know and they will add them. AAL asked SM to confirm if she is happy to review and approve the minutes and when the application is ready if it should be sent to the provincial authority.	SM confirmed she will review the minutes. SM asked that before the application is sent, she would like to check with her supervisor if they can accept the application and would inform the project team of the response. AAL proposed that when SM responds to the minutes she can then confirm if the department has the capacity to take on the applications. SM confirmed that she will do so.		-
GENERAL				
ERM	Confirmation of the Pre-Application Meeting reference. Minutes of the meeting will be distributed to all attendees and included in the Application Form(s) to the CA.	SM to confirm pre-application meeting reference	-	-

The meeting was concluded at 14h45 by AAL with no further discussion or questions.

Attachments:	image001.png FW Consultation Mlulio Wind Farms Mpumalanga.msg MTPA Acknowledgement of receipt RE 14121633225 91; 2592; 2593 Proposed Emvelo Rochdale and Sheepmoor WEFs MP.msg Pre-app.pdf

Dear Robyn

Thank you for your email in response to that of Bathandwa's in the email trail.
Apologies that the draft documents did not reach your desk, however these were submitted and made accessible to DARDLEA on 19th July (see email attached). Following your email on 3rd August 2024, we responded to you on 6th August (as per the email attached) and advised you that DARDLEA were in fact notified of the availability.

Your email on 8th August refers:
Good day Stephanie,
"*Be advised that the names of the officials at MTPA that you have highlighted in your below notification arenot the relevant officials that are required to be notified or the relevant officials that must review and comment on draft Scoping or EIA reports, or any reports related to an EIA process. There are also no officials in the list of officials in your screenshots that are in the Environmental Affairs Chief Directorate in MDARDLEA - as far as I am aware they are in the section that deals with Agriculture, which is an entirely different mandate.*
It would notbe acceptable to not provide the commenting authority the mandatory 30 days to review and comment on draft reports, especially in light of the fact that there has been no prior notification. The Directorate Environmental Impact Management within DARDLEA represents the MEC as Competent Authority in Mpumalanga, and the commenting authority in respect projects administered by DFFE. MTPA has the mandate for biodiversity matters on behalf of DARDLEA. As per my email to you below (3 August), hard copies of all reports must be submitted to Ms Mbuyane (Environmental Impact Management) at our Ermelo office, and the documents must be made available to me (and in this instance to Mr Cowden and Mr Lotter) electronically at the same time. You will need to contact Ms De Waal and Mr Krige at MTPA to confirm how documents must be submitted to MTPA. Please provide shape files of the 3 proposed WEFs as well."

We then responded to you with the links to access the documents electronically and couriered hard copies to Ms Sindi Mbuyane as per your request on 3rd August - we will follow up with the courier if these haven't been received by her as yet. MTPA received their hard copies yesterday (refer to email attached from Celia de Waa for proof of receipt).

Importantly, in your email of 3rd August, you state that "*DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities.*" You also state in your email of 8th August (referenced in the para above) that "*especially in light of the fact that there has been no prior notification*".
I would like to point out that Ms Sindi Mbuyane was in fact involved in the pre-app meeting – please see attached the pre-app meeting minutes that Ms Sindi signed.
Prior consultation therefore did happen and we kindly request that in light of this, you consider

completing your review of the DSR to meet the public participation deadline of 22 August 2024.

Should you be unable to provide your comments by this date, we would agree to the way forward stipulated in the email by Ms Bathandwa Ncube on 12 august 2024- ie. this would mean that the FSR would progress and get submitted without DARDLEA and MTPA comments if these are not available at the time, and for comments from these departments to be submitted as an addendum to the FSR.

We thank you for your engagement to date and look forward to your response.

You don't often get email from rluyt@mpg.gov.za. Learn why this is important

EXTERNAL MESSAGE

Good Morning all,

I am extremely concerned with the agreement reached between ERM and DFFE. DARDLEA, as the Provincial Department responsible for environmental affairs in Mpumalanga Province, **has to date not yet received any of the draft documents for review and comment.** In accordance with the requirements of Regulation 40(1)(b), the scoping report is required to be subjected to all I&APs for a period of at least 30 days for comment. Further to this, Regulation 40(2)(b) states that the public participation process must provide access to all information ...and must include consultation with every State department that administers a law relating to a matter affecting the environment relevant to an application for an environmental authorisation.

Regulation 21(1) is very clear in the requirement that a final Scoping Report must, within 44 days of submitting an application to the CA, be submitted to the CA (ie. DFFE), which report has been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received. The arrangement below is not in line with this requirement, which amounts to an administrative flaw, and I fail to see how DFFE would be in a position to consider a final Scoping report that does not include the input from DARDLEA. The arrangement would also preclude the requirement for the applicant to incorporate the comments received from DARDLEA into the final Scoping report.

As stated above, DARDLEA still awaits the documents for comment.

Kind Regards
Robyn

[redacted]

>>> Bathandwa Ncube <BNcube@dffe.gov.za> 08/12/24 4:14 PM >>>
Goodday Lucien

14/12/16/3/3/2/2591: THE PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

14/12/16/3/3/2/2592: THE PROPOSED DEVELOPMENT OF THE ROCHDALE WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, INCLUDING A GRID CONNECTION, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

14/12/16/3/3/2/2593: THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The application and draft Scoping Report (SR) for Environmental Authorisation received by the Department on 22 July 2024 refers.

Following our telephone conversation earlier today regarding the public participation process, please be informed that comments on the draft Scoping Report (SR) are due to you on 22 August 2024. It is noted that there are organs of state who have jurisdiction in respect of the proposed activity, which requires that they be added to the I&AP Database and given an opportunity to comment on the draft SR.

The applicant is requested to submit the final SR to the Department on or before the due date (05 September 2024) and may submit comments from MTPA and DARDLEA as addendums, subsequent to the submission of the final SR to the Department.

MTPA and Mpumalanga DARDLEA are requested to cc this Department when submitting comments to the EAP.

Kind regards
Ms Bathandwa Ncube (EAPASA)

Subject: RE: Consultation | Mlulio Wind Farms Mpumalanga

Good day Robyn,

Please note that DARDLEA and MTPA were notified regarding the PP for the Draft scoping Phase on the 19th July 2024. Kindly see proof of notification below:

If required, we will send through hard copies and also resend to the below contacts and will update our I&AP database accordingly. Additionally, kindly note that PPP for the Mulilo Wind Energy Farm in Mpumalanga closes the 20th of August 2024.

Thank you,

ERM

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	DESIGNATION	EMAIL	PHONE
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe	Deputy Director:	mbuyanesb@mpg.gov.za	[redacted]

Mbuyane	EIM Gert Sibande District		[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	
MTPA	**DESIGNATION**	**EMAIL**	**PHONE**
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za	
Khumbelo Malele	Land Use Advisor	Khumbelo.Malele@mtpa.co.za khumbelomalele@gmail.com	[redacted]
Celia de Waal	EIA Data Capturer LUA	celia.dewaal@mtpa.co.za	[redacted]

Please note that time frames for commenting on draft reports can only commence on the date that hard copies of the reports are received, and we request that our 30 day time frame aligns with DFFE's.

Kind Regards
Robyn

The application and draft Scoping Report (SR) for Environmental Authorisation received by the Department on 22 July 2024 refers.

Following our telephone conversation earlier today regarding the public participation process, please be informed that comments on the draft Scoping Report (SR) are due to you on 22 August 2024. It is noted that there are organs of state who have jurisdiction in respect of the proposed activity, which requires that they be added to the I&AP Database and given an opportunity to comment on the draft SR.

The applicant is requested to submit the final SR to the Department on or before the due date (05 September 2024) and may submit comments from MTPA and DARDLEA as addendums, subsequent to the submission of the final SR to the Department.

MTPA and Mpumalanga DARDLEA are requested to cc this Department when submitting comments to the EAP.

ORGANISATION	COMMENT RAISED	NOTES / RESPONSES / ACTIONS	PERSON	DUE DATE
WELCOME AND MEETING PURPOSE				
ERM	AAL welcomed attendees, and all present introduced themselves and their roles in the proposed development application process.	Please refer to Appendix A for a copy of the attendance register as downloaded from MS Teams after the meeting.	-	-
ERM	For minute purposes, the meeting was recorded using the MS Teams record option.	Please refer to Appendix B for a copy of the presentation.	-	-
ERM	AAL listed the meeting agenda.	No objections were raised to the meeting agenda.	-	-
ERM	AAL explained the meeting must be considered a formal consultation. AAL confirmed the purpose of the meeting.	The meeting was considered a formal consultation in terms of the requirements as stipulated in the Environmental Impact Assessment Regulations, 2014 (as amended), as promulgated in terms of the Nation Environmental Management ACT, 1998 (Act No. 107 of 1998) (NEMA). The purpose of this meeting is to discuss the Application(s) for Environmental Authorisation of the Associated Infrastructures for the proposed WEF Cluster in the Mpumalanga Province in terms of Regulation 31 and 32 of the NEMA EIA Regulations, 2014 (as amended).	-	-
PROJECT LOCALITY, SPECIFICATIONS AND MOTIVATION FOR THE MULILO WEF APPLICATIONS				
ERM	The project locality was explained and presented in a map to all attendees.	The project locality was explained (The proposed WEFs is located between 15-30 km east of the town of Ermelo in the Mpumalanga Province, South Africa. It falls within the Msukaligwa local municipality and Gert Sibande district municipality) and a map was presented to the attendees. The proposed grid infrastructure was presented. Each WEF has 1 preferred and 3 alternative OHPL routes (4 in total to be assessed in a 300 m corridor). Four slides of maps were shown to the attendees. Slide 1 presented the Mulilo WEF cluster location. Slide 2 to 4 presented each WEF and associated infrastructure individually.	-	-
ERM	The technical specifications of the proposed developments were presented.	Technical specifications were presented in table format. Three WEFs (proposed facilities) were outlined according to project name, applicant, total MW, number of turbines, proximity to Eskom Camden Substation (SS). Each Mulilo WEF will be	-	-

 S.B

ORGANISATION	COMMENT RAISED	NOTES / RESPONSES / ACTIONS	PERSON	DUE DATE
		applied for in separate Application forms, including accompanying assessment reports – 3 Applications for Scoping and EIA Process equals 3 EAs. The grid connection for each WEF will be applied for in a separate application – 3 applications following a Basic Assessment (BA) process equals 3 EAs.		
ERM	The motivation for the proposed development was explained to the DFFE.	Developer intends to bid the facilities in the seventh bidding window of the REIPPPP (Renewable Energy Independent Power Producer Procurement Programme) with the aim of evacuating the generated power from the WEFs into the National Eskom Grid. Aid in the diversification and stabilisation of the country's electrical supply in line with the objective of the IRP.	-	-
LEGISLATIVE FRAMEWORK AND PUBLIC PARTICIPATION PROCESS				
ERM	Legislative Framework and Public Participation Process was outlined to DFFE, including consideration of the Directions of 5 June 2020 regarding the COVID-19 Pandemic, i.e., to submit the Applications electronically to the DFFE.	Application for the BA will be in accordance with the EIA Regulations of December 2014 as amended, published in terms of regulation 31 and 32 NEMA, 1998. The project process will be: initiation and review, public participation, reporting and decision-making phase.	-	-
ERM	Public participation process.	Initial phase public consultation includes site notices, poster notices at local stores in the town of Ermelo and Amsterdam and email notification to the pre-identified I&APs. The EAP will conduct a PP process during the draft phase in accordance with Chapter 6 of the EIA regulations, 2017 as amended, and the PP guidelines.	-	-
SPECIALIST REPORTING AND TEAM				
ERM	Site visits will be / has been conducted by specialists, as required, following the requirement of GN 43110 of NEMA: Environmental Themes Reporting Criteria and the Relevant Protocols Gazetted.	DFFE screening reports were sent to all specialists. Specialists' will produce separate BA reports which will consider the results of the screening reports. The 12-month bird monitoring is currently in process and will conclude following the winter season 2023. All specialist visits will be conducted following the requirements of the protocols and any other relevant guidelines applicable.	-	-

S.B

ORGANISATION	COMMENT RAISED	NOTES / RESPONSES / ACTIONS	PERSON	DUE DATE
DISCUSSIONS / QUESTIONS/ GENERAL TOPICS				
MPG	SM queried with the project team if the national department was consulted to establish if they are not the competent authority ('CA'). If not, the provincial authority would process the applications	LB responded that the development will be handed over to Eskom once approved. The initial strategy was for the national department to act as the CA as they are the CA for the WEF applications and it would have made sense for one CA to authorise for one project. The national department did acknowledge the preference however stated that a pre application meeting would still be required with the provincial department as the provincial department would decide if they want to be the CA or allow for the national department to be the CA.		-
MPG	SM informed the project team that the Mpumalanga Department is in the process of writing a request to the Minister to deal with these applications. Therefore, all the applications might go to the national department. If the national department says the provincial department must decide, the provincial department cannot decline the challenge of exposure to other environmental aspect that come with the project. The application can be submitted to the provincial department but note that the applications might be delegated to the national department especially those transferred to Eskom.	LB confirmed that the applications will be transferred to Eskom. He queried that now knowing about the delegation letter, in the interest of time would it not be better submit the applications to the national authority to ensure that the project developers can meet the different deadlines to get all project components authorised at the same time. On a case-by-case basis, the provincial department can request the national department to be the component authority. He expressed concern that the decision making of who the CA is, might cause delays on the Applications.		-
MPG	SM commented that she does not think there will be any delays if the application is submitted to the provincial authority. They will be advised to process the application and not undertake more applications. Alternatively, if the national department is the CA, then the provincial department can be a commenting authority.	LB responded that his concern was if there were changes after submitting the application however he is happy to submit the applications and have them continue with one CA. SM stated that they hope there will not be a need to send the applications to the national department if they are done by the provincial government.		-
Mulilo	LB queried that in terms of the application, the developers would like to have the proposed route, the layout and EMPr approved with the environmental authorisation to avoid doing future processes. Having the layout approved at the planning stage is sometimes tricky so is there anything that can be done to out the project developers in a good position to have the layout approved?	SM responded that what would assist is contacting Mpumalanga Tourism and Parks agency since they are the main custodians of biodiversity in Mpumalanga and their guidelines will provide guidance on avoiding biodiversity sensitive areas. As well as BirdLife SA for any birds that might be present in the area.		-

ORGANISATION	COMMENT RAISED	NOTES / RESPONSES / ACTIONS	PERSON	DUE DATE
Mulilo	LB stated that one year monitoring is already being conducted for birds and bats. All the specialists have been to site recently to identify any sensitivities and those two I&APs will be identified and notified. By obtaining comments from them, it puts the project in a good position to obtain approval for final layout	SM confirmed that they will be able to assist with avoiding biodiversity sensitive areas. SM also advised including national department of rural development and land reform for agricultural fields, and the Gert Sibande District Municipality.		-
ERM	AAL asked that if SM has more people who can be included on the I&AP database to please let the project team know and they will add them. AAL asked SM to confirm if she is happy to review and approve the minutes and when the application is ready if it should be sent to the provincial authority.	SM confirmed she will review the minutes. SM asked that before the application is sent, she would like to check with her supervisor if they can accept the application and would inform the project team of the response. AAL proposed that when SM responds to the minutes she can then confirm if the department has the capacity to take on the applications. SM confirmed that she will do so.		-
GENERAL				
ERM	Confirmation of the Pre-Application Meeting reference. Minutes of the meeting will be distributed to all attendees and included in the Application Form(s) to the CA.	SM to confirm pre-application meeting reference	-	-

The meeting was concluded at 14h45 by AAL with no further discussion or questions.

EXTERNAL MESSAGE

DDear Stephanie,

I am writing to clarify several points regarding the recent applications:

The appropriate MTPA staff members responsible for reviewing these three applications only received the links on August 6th and hard copies on August 12th.

The two MTPA staff members you contacted in July are involved in permitting processes (such as issuing permits for collecting protected species) and are not responsible for reviewing development applications. As they were blind copied, they would have been unaware if the correct staff had been included in the correspondence.

According to the minutes you provided, Ms. Mbuyane informed you on May 31, 2024, that "*the MTPA is the main custodian of biodiversity in Mpumalanga and their guidelines would provide guidance on avoiding biodiversity sensitive areas*." However, it appears this guidance was not sought.

Upon reviewing my email records, I found communications from Andrew Pearson, Annitta Attieh, and Verushka Snyders (all from Mulilo) regarding CBAs for other projects, indicating that Mulilo is aware that I am the appropriate contact for biodiversity planning related matters. I also have several emails to both Frans Krige and myself from ERM staff, such as Kate Hamilton from around 2016 and more recently. ERM should know who the correct staff would be to send the EIA documents to for comment.

We are currently managing several other development applications with similar deadlines. Given the short notice, it would be challenging to thoroughly review and apply our minds to the three applications before August 22nd.

It is regrettable that we were not consulted earlier, despite the prior recommendation to do so. This has now placed undue pressure on our team to meet your deadline.

Comments from authorities need to be considered and incorporated into the final EIA document. Including them as an appendix defeats the purpose of the legislated timeframes and the need to consider these inputs in the first place. This is a risk to your project.

We can only try and do our best.

Regards,
Mervyn

On Tue, 13 Aug 2024 at 15:56, Stephanie Gopaul <stephanie.gopaul@erm.com> wrote:

> Dear Robyn

Thank you for your email in response to that of Bathandwa's in the email trail.

Apologies that the draft documents did not reach your desk, however these were submitted and made accessible to DARDLEA on 19th July (see email attached). Following your email on 3rd August 2024, we responded to you on 6th August (as per the email attached) and advised you that DARDLEA were in fact notified of the availability.

Your email on 8th August refers:

Good day Stephanie,

"*Be advised that the names of the officials at MTPA that you have highlighted in your below notification arenot the relevant officials that are required to be notified or the relevant officials that must review and comment on draft Scoping or EIA reports, or any reports related to an EIA process. There are also no officials in the list of officials in your screenshots that are in the Environmental Affairs Chief Directorate in MDARDLEA - as far as I am aware they are in the section that deals with Agriculture, which is an entirely different mandate.*

It would notbe acceptable to not provide the commenting authority the mandatory 30 days to review and comment on draft reports, especially in light of the fact that there has been no prior notification. The Directorate Environmental Impact Management within DARDLEA represents the MEC as Competent Authority in Mpumalanga, and the commenting authority in respect projects administered by DFFE. MTPA has the mandate for biodiversity matters on behalf of DARDLEA. As per my email to you below (3 August), hard copies of all reports must be submitted to Ms Mbuyane (Environmental Impact Management) at our Ermelo office, and the documents must be made available to me (and in this instance to Mr Cowden and Mr Lotter) electronically at the same time. You will need to contact Ms De Waal and Mr Krige at MTPA to confirm how documents must be submitted to MTPA. Please provide shape files of the 3 proposed WEFs as well."

We then responded to you with the links to access the documents electronically and couriered hard copies to Ms Sindi Mbuyane as per your request on 3rd August - we will follow up with the courier if these haven't been received by her as yet. MTPA received their hard copies yesterday (refer to email attached from Celia de Waa for proof of receipt).

Importantly, in your email of 3rd August, you state that "*DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities.*" You also state in your email of 8th August (referenced in the para above) that "*especially in light of the fact that there has been no prior notification*".

I would like to point out that Ms Sindi Mbuyane was in fact involved in the pre-app meeting – please see attached the pre-app meeting minutes that Ms Sindi signed.

Prior consultation therefore did happen and we kindly request that in light of this, you consider completing your review of the DSR to meet the public participation deadline of 22 August 2024.

Should you be unable to provide your comments by this date, we would agree to the way forward stipulated in the email by Ms Bathandwa Ncube on 12 august 2024- ie. this would mean that the FSR would progress and get submitted without DARDLEA and MTPA comments if these are not available at the time, and for comments from these departments to be submitted as an addendum to the FSR.

We thank you for your engagement to date and look forward to your response.

EXTERNAL MESSAGE

Good Morning all,

I am extremely concerned with the agreement reached between ERM and DFFE. DARDLEA, as the

Provincial Department responsible for environmental affairs in Mpumalanga Province, **has to date not yet received any of the draft documents for review and comment.** In accordance with the requirements of Regulation 40(1)(b), the scoping report is required to be subjected to all I&APs for a period of at least 30 days for comment. Further to this, Regulation 40(2)(b) states that the public participation process must provide access to all information ...and must include consultation with every State department that administers a law relating to a matter affecting the environment relevant to an application for an environmental authorisation.

Regulation 21(1) is very clear in the requirement that a final Scoping Report must, within 44 days of submitting an application to the CA, be submitted to the CA (ie. DFFE), which report has been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received. The arrangement below is not in line with this requirement, which amounts to an administrative flaw, and I fail to see how DFFE would be in a position to consider a final Scoping report that does not include the input from DARDLEA. The arrangement would also preclude the requirement for the applicant to incorporate the comments received from DARDLEA into the final Scoping report.

As stated above, DARDLEA still awaits the documents for comment.

Kind Regards

Robyn

EXTERNAL MESSAGE

Dear Stephanie,

Following the discussion between the Provincial Department (DARDLEA) and the EAP earlier this morning, it was confirmed that the EAP did notify the province about the proposed wind energy developments but unfortunately the notification was sent to the Agriculture section within the department and the environmental section did not get the notification/draft reports. The Provincial Department was made aware of the public review of the draft scoping reports of the proposed developments by other interested and affected parties and Ms Luyt contacted ERM and requested the draft reports for comment on 03 August 2024 (see attached email). The EAP/Applicant failed to submit the requested reports until this week. The Provincial Department and MTPA must be afforded 30 days to comment as per EIA Regulations 2014 as amended otherwise the process will be viewed as being procedural flawed.

Considering the above, it is noted that the EAP will not be able to meet the regulated time frames for the submission of the final Scoping Reports (05 September 2024), and thus, the applications are going to regrettably lapse. Therefore the Department advices that the EAP withdraws the current applications and reapply. Please note that , reapplying constitutes the EIA process from the beginning.

Regards,

MASINA MORUDU

Subject: Re: 14/12/16/3/3/2/2591; 2592; 2593: Proposed Emvelo, Rochdale and Sheepmoor WEFs, MP
Importance: High

Good Morning all,

I am extremely concerned with the agreement reached between ERM and DFFE. DARDLEA, as the Provincial Department responsible for environmental affairs in Mpumalanga Province, **has to date not yet received any of the draft documents for review and comment.** In accordance with the requirements of Regulation 40(1)(b), the scoping report is required to be subjected to all I&APs for a period of at least 30 days for comment. Further to this, Regulation 40(2)(b) states that the public participation process must provide access to all information ...and must include consultation with every State department that administers a law relating to a matter affecting the environment relevant to an application for an environmental authorisation.

Regulation 21(1) is very clear in the requirement that a final Scoping Report must, within 44 days of submitting an application to the CA, be submitted to the CA (ie. DFFE), which report has been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received. The arrangement below is not in line with this requirement, which amounts to an administrative flaw, and I fail to see how DFFE would be in a position to consider a final Scoping report that does not include the input from DARDLEA. The arrangement would also preclude the requirement for the applicant to incorporate the comments received from DARDLEA into the final Scoping report.

As stated above, DARDLEA still awaits the documents for comment.

Kind Regards
Robyn

>>> Bathandwa Ncube <BNcube@dffe.gov.za> 08/12/24 4:14 PM >>>
Goodday Lucien

14/12/16/3/3/2/2591: THE PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

14/12/16/3/3/2/2592: THE PROPOSED DEVELOPMENT OF THE ROCHDALE WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, INCLUDING A GRID CONNECTION, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

14/12/16/3/3/2/2593: THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The application and draft Scoping Report (SR) for Environmental Authorisation received by the Department on 22 July 2024 refers.

Following our telephone conversation earlier today regarding the public participation process, please be informed that comments on the draft Scoping Report (SR) are due to you on 22 August 2024. It is noted that there are organs of state who have jurisdiction in respect of the proposed activity, which requires that they be added to the I&AP Database and given an opportunity to comment on the draft SR.

The applicant is requested to submit the final SR to the Department on or before the due date (05 September 2024) and may submit comments from MTPA and DARDLEA as addendums, subsequent to the submission of the final SR to the Department.

MTPA and Mpumalanga DARDLEA are requested to cc this Department when submitting comments to the EAP.

Kind regards

Ms Bathandwa Ncube (EAPASA)

[redacted]

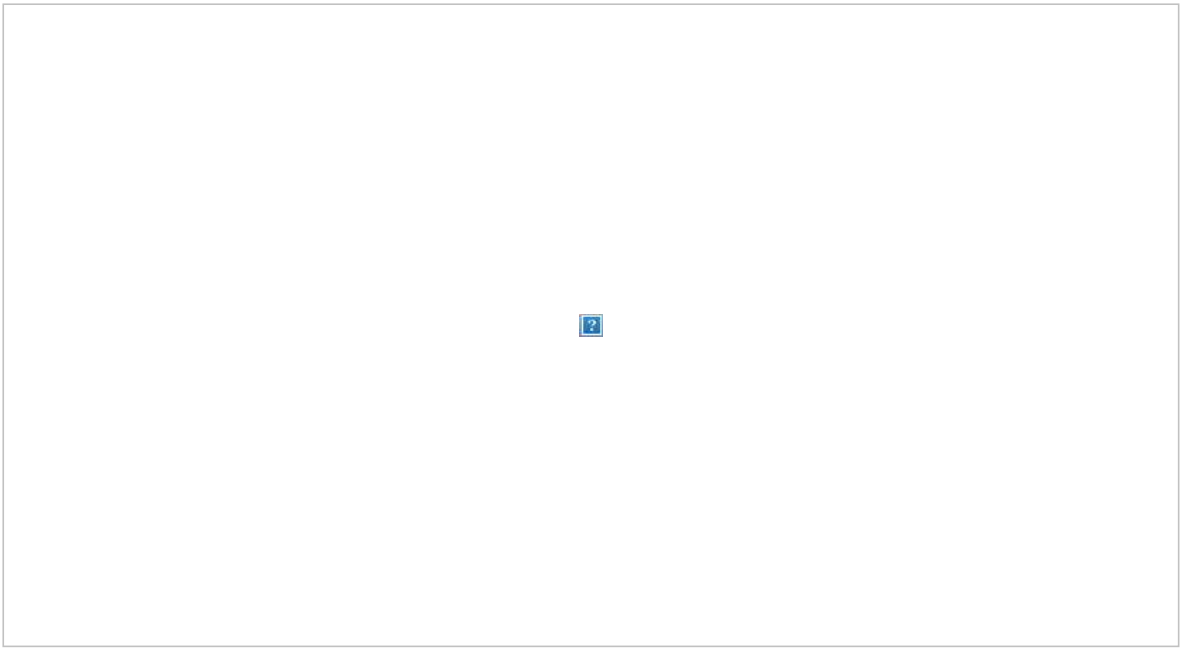
>>> Robyn Luyt 08/07/24 9:41 AM >>>
Good day Stephanie,

Be advised that the names of the officials at MTPA that you have highlighted in your below notification are **not the relevant officials** that are required to be notified or the relevant officials that must review and comment on draft Scoping or EIA reports, or any reports related to an EIA process. There are also no officials in the list of officials in your screenshots that are in the Environmental Affairs Chief Directorate in MDARDLEA - as far as I am aware they are in the section that deals with Agriculture, which is an entirely different mandate.



It would **not** be acceptable to not provide the commenting authority the mandatory 30 days to review and comment on draft reports, especially in light of the fact that there has been no prior notification. The Directorate Environmental Impact Management within DARDLEA represents the MEC as Competent Authority in Mpumalanga, and the commenting authority in respect projects administered by DFFE. MTPA has the mandate for biodiversity matters on behalf of DARDLEA. As per my email to you below (3 August), hard copies of all reports must be submitted to Ms Mbuyane (Environmental Impact Management) at our Ermelo office, and the documents must be made available to me (and in this instance to Mr Cowden and Mr Lotter) electronically at the same time. You will need to contact Ms De Waal and Mr Krige at MTPA to confirm how documents must be submitted to MTPA. Please provide shape files of the 3 proposed WEFs as well.

Regards
Robyn

EXTERNAL MESSAGE

Good day Ms Gopaul,

It has come to our attention, and not via any official notification from ERM, that draft Scoping Reports for the following wind farms proposed in the Gert Sibande District in Mpumalanga Province are out for public comment from 19 July 2024 to 20 August 2024 (as per ERM website), where ERM is the EAP:
1. Shepmoore WEF
2. Emvelo WEF
3. Rochdale WEF

Neither DARDLEA nor MTPA have been consulted to date, nor have we received copies of any of the draft Scoping Reports. Aside from the requirements of the EIA Regulations, DARDLEA and MTPA have through internal arrangements with DFFE requested to be included in all pre-application consultations for Renewable Energy projects in Mpumalanga, particularly wind energy facilities. DARDLEA and MTPA must be included during all pre-application meetings and in all in-process consultations.

For the purpose of commenting on draft reports during the regulatory periods, we request that hard copies of all reports are submitted to Ms Sindi Mbuyane in our Ermelo office (where projects are located in the Gert Sibande District), and sent electronically to me via WeTransfer. Please also ensure that MTPA receives the reports in the manner requested by them. For your records I include the contact details of all relevant officials to be consulted in DARDLEA (when an application is in the Gert Sibande District) and MTPA:

DARDLEA	DESIGNATION	EMAIL	PHONE
Robyn Luyt	Director: Environmental Impact Management (EIM)	rluyt@mpg.gov.za	[redacted]
Sindisiwe Mbuyane	Deputy Director: EIM Gert Sibande District	mbuyanesb@mpg.gov.za	[redacted]
Gavin Cowden	Deputy Director: Environmental Policy, Planning and Coordination	gcowden@mpg.gov.za	

MTPA	DESIGNATION	EMAIL	PHONE
Mervyn Lotter	Manager: Biodiversity Planning	Mervyn@mtpa.co.za	[redacted]
Frans Krige	Land Use Advisor	Frans.Krige@mtpa.co.za	
Khumbelo Malele	Land Use Advisor	Khumbelo.Malele@mtpa.co.za khumbelomalele@gmail.com	[redacted]
Celia de Waal	EIA Data Capturer LUA	celia.dewaal@mtpa.co.za	[redacted]

Please note that time frames for commenting on draft reports can only commence on the date that hard copies of the reports are received, and we request that our 30 day time frame aligns with DFFE's.

Kind Regards
Robyn

Hi Lloyd and Andrew,

I have come across information (please see email trail below) indicating that Mervyn from MTPA had accessed our reports from EDF renewables on August 2, 2024.

Could you please advise on how you would like to proceed with this information? Specifically, should we inform Masina about this development? Additionally, it would be helpful to receive feedback from DARDLEA and MTPA by tomorrow so we can plan our next steps accordingly.

Thank you for your attention to this matter.

Hi there

Christophe sent me the attached KML file and the below links. I see these are links to scoping reports dated 19 July 2024. They seem to have started with the application process while not yet consulting us.

Celia, could you please write to ERM to request copies of the three wind farm documents for comment.

Robyn/Sindy, you may want to do the same.

I have updated our webmap with these latest boundaries from the KML file.

Best wishes
Mervyn

Good afternoon everyone,

Thank you so much for your time and very valuable feedback and recommendations.

Ryan and I are now back in Cape Town and addressing your comments.

We have liaised back with our EAP and will provide you with further information shortly.

Thanks again for taking the time to meet with us and for the transparency, we highly appreciate it.

I will be sending a couple of emails in the next few days in line with our engagement.

Kind regards,

Christophe

SUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the submission of the Draft Scoping Reports for the proposed Mulilo Amsterdam WEFs, near Ermelo, Mpumalanga.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 19 July 2024 to 20 August 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.
More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Geagte Belanghebbende en Geaffekteerde Party, Belanghebbende, Staats orgaan

KENNISGEWING VAN BESKIKBAARHEID VAN DIE KONSEP-OMVANGS VERSLAE VIR OPENBARE HERSIENING EN KOMMENTAAR VAN DIE VOORGESTELDE AMSTERDAM WIND ENERGIE FASILITEIT (EMVELO, ROCHDALE EN SHEEPMOOR) CLUSTER, NABY ERMELO, MPUMALANGA

Kennis word hiermee gegee van 'n openbare deelname proses (ODP) wat in gevolge die Wet op Nasionale Omgewingsbestuur, 1998 (Wet No. 107 van 1998) (NEMA, 1998), soos gewysig, onderneem moet word.

DFFE-verwysing(s): Om bevestig te word

Aard van aktiwiteit: Emvelo (Edms) Bpk, Rochdale (Edms) Bpk en Sheepmoor (Edms) Bpk ('die Projek aansoekers') stel voor dat drie (3) Wind energie fasiliteite (WEF) opgerig en bedryf word. Die potensiële opwekkingsvermoë van Emvelo WEF is tot 200 MW, Rochdale WEF is tot 220 MW en Sheepmoor tot 360 MW. Elke WEF sal bestaan uit verskeie geboue, toegangspaaie, 'n battery-energieberging stelsel (BESS) en 'n substasie naaf met gepaardgaande elektriese netwerk infrastruktuur soos, maar nie beperk tot 'n 132kV oorhoofse transmissie kraglyn wat die WEF met die nasionale elektriese netwerk verbind.

Ontwikkelings ligging: Die voorgestelde Amsterdam WEF se cluster is 30 km oos van Ermelo binne die Msukaligwa Plaaslike Munisipaliteit en Gert Sibande Distriksmunisipaliteit geleë.

Aansoek proses: Ingevolge Hoofstuk 5 van die Wet op Nasionale Omgewingsbestuur, 1998 (Wet 107 van 1998 – NEMA), Omgewings Impak studie (EIA) Regulasies, 2014 (soos gewysig), het die Projek aansoekers, Environmental Resources Management (Edms) Bpk (ERM) aangestel om as projek bestuurder op te tree en die Omvang- en Omgewings Impak bepalings prosesse (S&EIA) as die onafhanklike omgewings impak bepalings praktisyn (EAP) te onderneem.

ERM het drie afsonderlike omgewings aansoeke ingedien, waaronder afsonderlike konsep-omvang verslae aan die departement van bosbou, visserye en die omgewing (DFFE).

Uitnodiging om kommentaar te lewer: Lede van die publiek, plaaslike gemeenskappe en belanghebbendes word uitgenooi om kommentaar te lewer op die konsep-omvang verslae, wat beskikbaar is vir openbare hersiening en kommentaar, vanaf **Donderdag, 22 Augustus 2024 tot Saterdag die 21 September 2024 (albei dae ingesluit),** soos per Tabel 1 hieronder.

Tabel 1: Liggings vir openbare oorsig en kommentaar

ERM webtuiste *(beskikbaar vir aflaai)*	Proposed Amsterdam wind energy facility and auxiliary infrastructure cluster in Mpumalanga (erm.com)

Na afloop van die openbare deelname van 30 dae, sal die kommentaar aangespreek en opgeneem word in die Finale Omvang verslae, wat aan die DFFE voorgelê sal word vir goedkeuring om na die EIA-fase te vorder.

Let wel, met betrekking tot die Wet op die Beskerming van Persoonlike Inligting (PoPI Wet 4 van 2013, soos gewysig): Indien u versoek om as 'n I&AP te registreer, sal u persoonlike inligting aan 'n appel kandidaat beskikbaar gestel word in die geval van 'n appèl, en 'n aansoeker/EAP/onafhanklike persoon vir doeleindes daarvan om ingelig te word en toegang tot 'n ouditverslag te kry.

Korrespondensie gedurende die aansoek proses sal slegs aan geregistreerde I &AP's versprei word. Registrasie is moontlik gedurende die aansoek proses.

Dankie vir die belangstelling in die projek.

Dear Interested and Affected Party, Stakeholder, Organ of State

NOTIFICATION OF AVAILABILITY OF THE DRAFT SCOPING REPORTS FOR PUBLIC REVIEW AND COMMENT OF THE PROPOSED AMSTERDAM WIND ENERGY FACILITY (EMVELO, ROCHDALE AND SHEEPMOOR) CLUSTER, NEAR ERMELO, MPUMALANGA

Notice is hereby given of a Public Participation Process (PPP) to be undertaken in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA, 1998), as amended.

DFFE Reference(s): To Be Confirmed

Nature of Activity: Emvelo Wind Energy Facility (Pty) Ltd, Rochdale Wind Energy Facility (Pty) Ltd and Sheepmoor Wind Energy Facility (Pty) Ltd ('the Project Applicants') are proposing the construction and operation of three (3) Wind Energy Facilities (WEF). The potential generation capacity of Emvelo WEF is up to 200 MW, Rochdale WEF is up to 220 MW and Sheepmoor up to 360 MW. Each WEF will comprise various buildings, access roads, a battery energy storage system (BESS), and a substation hub with associated electrical grid infrastructure such as but not limited to a 132kV overhead transmission powerline connecting the WEF to the national electrical grid network.

Development Location: The proposed Mulilo WEF's Cluster are located 30 km east of Ermelo within the Msukaligwa Local Municipality, and Gert Sibande District Municipality.

Application Process: In terms of Chapter 5 of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA), Environmental Impact Assessment (EIA) Regulations, 2014 (as amended), the Project Applicants appointed Environmental Resources Management (Pty) Ltd (ERM), to act as the project manager and to undertake the Scoping and Environmental Impact Assessment (S&EIA) processes as the independent environmental impact assessment practitioner (EAP).

ERM has submitted three separate Environmental Applications, including separate Draft Scoping Reports to the Department of Forestry, Fisheries and the Environment (DFFE).

Invitation to Comment: Members of the public, local communities, and stakeholders are invited to comment on the Draft Scoping Reports, which is available for public review and comment, from **Thursday, 22 August 2024 until the Saturday, 21 September 2024 (both days inclusive)**, as per Table 1 below.

ERM Website *(available for download)*	Proposed Amsterdam wind energy facility and auxiliary infrastructure cluster in Mpumalanga (erm.com)

Following the 30-day public participation, the comments will be addressed and incorporated into the Final Scoping Reports, which will be submitted to the DFFE for approval to progress to the EIA Phase.

Please note, regarding the Protection of Personal Information Act (PoPI Act 4 of 2013, as amended): If you request to register as an I&AP, your personal information will be made available to an appellant in the case of an appeal, and an applicant/EAP/independent person for purposes of being informed and given access to an audit report.

Correspondence throughout the Application Process will only be distributed to Registered I&APs. Registration is possible throughout the Application Process.

Thank you for the interest in the project.

RESUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the resubmission of the Draft Scoping Reports for the proposed Amsterdam WEFs, near Ermelo, Mpumalanga.

The previous applications for these proposed projects have been withdrawn to allow for an additional comment period for all I&AP's. Please note that all comments received during the previous comment period will still be incorporated in the comments and responses for these new applications. Should you wish to confirm that your comment is being incorporated, please feel free to email us.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 22 August to 21 September 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.

More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

Environmental Assessment Practitioner

Good day Sindy,

Thank you for your query.

The report content of the versions you have has not changed with the resubmission, other than the amendment of the dates of public participation (PP), and thus the versions you have can be used to confirm receipt if you are happy to do so. Additional copies of the reports (including the amended dates for PP) have been couriered to you and should be with you soon.

Please let me know if you have any queries regarding the above.

Kind regards,

ERM

EXTERNAL MESSAGE

Dear Sir/Madam

ACKNOWLEDGEMENT OF RECEIPT OF THE NEW APPLICATION FORM AND DRAFT SCOPING REPORT FOR THE PROPOSED PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, AND GERT SIBANDE DISTRICT MUNICIPALITY, MPUMALANGA PROVINCE.

The Department confirms having received the Application Form and Draft Scoping Report for Environmental Authorisation for the abovementioned project on 22 August 2024. You have submitted these documents to comply with the Environmental Impact Assessment (EIA) Regulations, 2014, as amended.

Kindly note that your application for Environmental Authorisation falls within the ambit of an application applied for in terms of Part 3 of Chapter 4 of the EIA Regulations, 2014, as amended. You are therefore referred to Regulation 21 of the EIA Regulations, 2014 as amended.

Please take note of Regulation 40(3) of the EIA Regulations, 2014, as amended, which states that potential Interested & Affected Parties, including the Competent Authority, may be provided with an opportunity to comment on reports and plans contemplated in Regulation 40(1) of the EIA Regulations, 2014, as amended, prior to the submission of an application but must be provided an opportunity to comment on such reports once an application has been submitted to the Competent Authority.

Note that in terms of Regulation 45 of the EIA Regulations, 2014, as amended, this application will lapse if the applicant fails to meet any of the time-frames prescribed in terms of these Regulations, unless an extension has been granted by the Department in terms of Regulation 3(7) of the EIA Regulations, 2014, as amended.

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Kind Regards,
Salome Mambane

RESUBMISSION OF DRAFT SCOPING REPORT FOR THE WIND ENERGY FACILITY (SHEEPMOOR, ROCHDALE AND EMVELO) CLUSTER

Dear Interested and Affected Party,

This email serves to inform you about the resubmission of the Draft Scoping Reports for the proposed Amsterdam WEFs, near Ermelo, Mpumalanga.

The previous applications for these proposed projects have been withdrawn to allow for an additional comment period for all I&AP's. Please note that all comments received during the previous comment period will still be incorporated in the comments and responses for these new applications. Should you wish to confirm that your comment is being incorporated, please feel free to email us.

Public Participation Process (PPP), which is being undertaken in accordance with the requirements of Section 24 (5) and Chapter 6 (41, 42, 43, and 44) of GN R. 326 of the NEMA, 1998 EIA Regulations, 2014 (as amended) and the Western Cape Department of Environmental Affairs & Development Planning (DEA&DP) Guideline on Public Participation (2011). The reports will be available for a 30 day comment period from 22 August to 21 September 2024.

Please ensure that you have submitted your comment before the close of the comment period should you wish to have your input considered in the submission of the Final Scoping Report.

More information on how you are able to participate in this process is attached in the above documentation.
Please indicate which application your comment in respect of.

Should you be a Land Owner directly affected by the proposed project (within the project boundary or adjacent thereto) please could you notify all occupants on your properties with regards to the proposed project.

Thank you and regards,

Stephanie Gopaul

1 IMPACT ASSESSMENT METHODOLOGY

The purpose of the assessment of impacts in an EIA is to evaluate the likely extent and overall significance that a potential impact may have on an identified receptor or resource. Another important aspect of the assessment of impacts is to quantify those impacts that are not scientific-based or evidence-based and include the opinions of others (i.e., the involvement and comment from I&APs).

A successful assessment of the potential significance of impacts will include the description and development of measures that will be taken to avoid, minimise or compensate for any adverse environmental impacts, to enhance positive impacts, and to report the significance of residual impacts that occur following mitigation.

A 7-step approach for the determination of significance of potential impacts was developed by ERM to align with the requirements of Appendix 3 of the EIA Regulations, 2014 (as amended). The approach is both objective and scientific based to allow appointed specialists and EAPs to retain independence throughout the assessment process.

ERM has adapted this 7-step approach from standard ranking metrics such as the Hacking Method, Crawford Method etc. The ERM 7-step approach complies with the method provided in the EIA guideline document (GN 654 of 2010) and considers international EIA Regulatory reporting standards such as the newly amended European Environmental Impact Assessment (EIA) Directive (2014/52/EU).

The 7-Step approach for determining the significance of impacts pre, and post mitigation, is described below:

- **Step 1:** Predict potential impacts by means of an appraisal of:
    - Site Surveys,
    - Project-related components and infrastructure,
    - Activities related with the project life-cycle,
    - The nature and profile of the receiving environment and potential sensitive environmental features and attributes,
    - Input received during public participation from all stakeholders, and
    - The relevant legal framework applicable to the proposed development
- **Step 2**: Determination of whether the potential impacts identified in **Step 1** will be *direct* (caused by construction, operation, decommissioning or maintenance activities on the proposed development site or immediate surroundings of the site), *indirect* (not immediately observable or do not occur on the proposed development site or immediate surroundings of the site), *residual* (those impacts which remain after post mitigation) and *cumulative* (the combined impact of the project when considered in conjunction with similar projects in proximity).
- **Step 3:** Description and determination of the significance of the predicted impacts in terms of the criteria below to ensure a consistent and systematic basis for the decision-making process. Significance is numerically quantified on the basis score of the following impact parameters:
    1. *Extent* **(E)** of the impact: The geographical extent of the impact on a given environmental receptor.
    2. *Duration* **(D)** of the impact: The length of permanence of the impact on the environmental receptor.
    3. *Reversibility* **(R) of the impact**: The ability of the environmental receptor to rehabilitate or restore after the activity has caused environmental change

4. *Magnitude* **(M)** of the impact: The degree of alteration of the affected environmental receptor.
5. *Probability* **(P)** of the impact: The likelihood of the impact actually occurring.

A widely accepted numerical quantification of significance is the formula:

S=(E+D+R+M)*P

Where: *Significance=(Extent+Duration+Reversibility+Magnitude) * Probability*

The following has also been considered when determining the significance of a potential impact.

6. **Nature (N)** of the impact: A description of what causes the effect, what will be affected, and how it will be affected.
7. **Status (S)** of the impact: described as either positive, negative or neutral
8. **Cumulative impacts**.
9. Inclusion of **Public comment.**

The significance of environmental impacts is determined and ranked by considering the criteria presented in **Table 1** below. All criteria are rank according to 'Very Low', 'Low', 'Moderate', 'High' and 'Very High' and are assigned scores of 1 to 5 respectively.

Table 1: Defining the significant in terms of the impact criteria.

Impact Criteria	Definition	Score	Criteria Description
Extent (E)	Site	1	Impact is on the site only
	Local	2	Impact is localized inside the activity area
	Regional	3	Impact is localized outside the activity area
	National	4	Widespread impact beyond site boundary. May be defined in various ways, e.g. cadastral, catchment, topographic
	International	5	Impact widespread far beyond site boundary. Nationally or beyond
Duration (D)	Immediate	1	On impact only
	Short term	2	Quickly reversible, less than project life. Usually up to 5 years.
	Medium term	3	Reversible over time. Usually between 5 and 15 years.
	Long term	4	Longer than 10 years. Usually for the project life.
	Permanent	5	Indefinite
Magnitude (M)	Very Low	1	No impact on processes
	Low	2	Qualitative: Minor deterioration, nuisance or irritation, minor change in species/habitat/diversity or resource, no or very little quality deterioration. Quantitative: No measurable change; Recommended level will never be exceeded.
	Moderate	3	Qualitative: Moderate deterioration, discomfort, Partial loss of habitat /biodiversity /resource or slight or alteration. Quantitative: Measurable deterioration; Recommended level will occasionally be exceeded.

Impact Criteria	Definition	Score	Criteria Description
	High	4	Qualitative: Substantial deterioration death, illness or injury, loss of habitat /diversity or resource, severe alteration or disturbance of important processes. Quantitative: Measurable deterioration; Recommended level will often be exceeded(e.g. pollution)
	Very High	5	Permanent cessation of processes
Reversibility (R)	Reversible	1	Recovery which does not require rehabilitation and/or mitigation.
	Recoverable	3	Recovery which does require rehabilitation and/or mitigation.
	Irreversible	5	Not possible, despite action. The impact will still persist, and no mitigation will remedy or reverse the impact.
Probability (P)	Improbable	1	Not likely at all. No known risk or vulnerability to natural or induced hazards
	Low Probability	2	Unlikely; low likelihood; Seldom; low risk or vulnerability to natural or induced hazards
	Probable	3	Possible, distinct possibility, frequent; medium risk or vulnerability to natural or induced hazards.
	Highly Probable	4	Highly likely that there will be a continuous impact. High risk or vulnerability to natural or induced hazards
	Definite	5	Definite, regardless of prevention measures.

The *significance* (s) of potential impacts identified according to the criteria above has been colour coded for the purpose of comparison. This colour coding will be used in impact tables.

Significance is deemed Negative (-)			Significance is deemed Positive (+)		
0 - 30	**31 - 60**	**61 - 100**	**0 - 30**	**31 - 60**	**61 - 100**
Low	**Moderate**	**High**	**Low**	**Moderate**	**High**

- **Step 4:** Determination of practical and reasonable mitigation measures based on specialists' inputs and field observations following the mitigation hierarchy (avoid, minimise, manage, mitigate, or rehabilitate).

- **Step 5:** Evaluation of predicted residual impacts after implementation of mitigation measures.

- **Step 6:** Determination of the significance of the impact taking into consideration the predicted residual impacts after implementation of mitigation measures.

- **Step 7:** Based on an acceptable significance of the impact, determination of the need and desirability of the proposed development and an opinion as to whether the development should proceed or not.

The Assessment of the significance of potential impacts is then populated in an Impact Summary Table.

2 IMPACT SUMMARY TABLE

Please copy the below table into your reports for any impact assessments required.

Impact Phase: Detail if the impact will take place during Construction/ Operation/Decommissioning					
Nature of the impact: Name of impact					
Description of Impact: Detailed description of impact xxxx …					
Impact Status: Detail of the impact is Positive, Neutral or Negative					
	E	**D**	**R**	**M**	**P**
Without Mitigation	Local	Medium Term	x	x	x
Score	2	3	x	x	x
With Mitigation	Site	Short Term	x	x	x
Score	1	2	x	x	x
Significance Calculation	**Without Mitigation**		**With Mitigation**		
S=(E+D+R+M)*P	Moderate Negative Impact (42)		Low Negative Impact (25)		
Was public comment received?	YES/NO. If yes, provide a bullet summary of main concerns.				
Has public comment been included in mitigation measures?	YES/NO, if NO then WHY? If YES then HOW/WHERE				
Mitigation measures to reduce residual risk or enhance opportunities: *List and describe* *Aaa* *Aaa* *Aaa* *Aaa* *Aaaa* …					
Residual impact	*Describe the impact.*				

3 ASSESSMENT OF CUMULATIVE IMPACTS

In relation to an activity, cumulative impact means *"the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities"* (NEMA EIA Reg GN R982 of 2014).

Specialists are required to assess cumulative impacts associated with similar developments within a 35 km radius of the proposed developments. The purpose of the cumulative assessment is to test if such impacts are relevant to the proposed developments in the proposed locations (i.e. whether the addition of the proposed project in the area will increase the impact). In this regard, specialist studies considered whether the construction of the proposed development will result in:

- Unacceptable risk
- Unacceptable loss
- Complete or whole-scale changes to the environment or sense of place
- Unacceptable increase in impact

Cumulative Impacts will be assessed and populate in a cumulative impact summary table.

Please copy the below table into your reports for any impact assessments required.

Cumulative Impact: Name of impact					
Description of Cumulative Impact: Detailed description of cumulative impact xxxx …					
Impact Status: Detail of the impact is Positive, Neutral or Negative					
	E	**D**	**R**	**M**	**P**
Without Enhancement	Local	Medium Term	x	x	x
Score	2	3	x	x	x
With Enhancement	Site	Short Term	x	x	x
Score	1	2	x	x	x
Significance Calculation	**Without Enhancement**		**With Enhancement**		
S=(E+D+R+M)*P	Moderate Negative Impact (42)		Low Negative Impact (25)		
Can Impacts be Enhanced?	YES/NO and HOW/WHY				
Enhancement: *List and describe* *Aaa* *Aaa* *Aaa* *Aaa* *Aaaa* …					
Residual impact	*Describe the impact.*

EXTERNAL MESSAGE

Dear ERM

Please may you register my details in signature below for any Mpumalanga projects - including Amsterdam - we are developing a wind farm near Ermelo named Zephyr.

Thanks very much

Ryan David-Andersen

EXTERNAL MESSAGE

Dear Stephanie,

Please find herewith DARDLEAs comments on the draft Scoping Report for the Emvelo WEF and Grid Connection.

Comments for Sheepmoor and Rochdale to follow.

Kind Regards
Robyn

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE EMVELO WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON VARIOUS PORTIONS OF THE FARMS SCHIEDAM 274 IT, VAALBANK 285 IT, WAALHOEK 286 IT, KLIPFONTEIN 283 IT, BOSJESSPRUIT 291 IT, ONVERWACHT 273 IT, ZWARTWATER 288 IT, WELTEVREDEN 289 IT, WITPUT AND MOOIPLAATS 290 IT AND CAMDEN POWER STATION 329 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Emvelo Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 21%)**, Intact Grassland Patches **(33%)**, Key Biodiversity Areas **(21.4%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered). Furthermore, 43% of the site falls within Grasslands SA020 Important Bird Area (IBA), and close to two other Important Bird Areas.
2. The proposed Emvelo WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered); Denham's Bustard (Globally Near Threatened, Regionally Vulnerable); Secretary bird (Globally Endangered, Regionally Vulnerable); White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened); Grey Crowned Crane (Globally and Regionally Endangered); Martial Eagle (Globally and Regionally Endangered); Lanner Falcon (Regionally Vulnerable); Greater Flamingo (Regionally Near Threatened); Southern Bald Ibis (Regionally and Globally Vulnerable); Cape Vulture (Globally Vulnerable and Regionally Endangered); and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
3. Furthermore, intact grassland patches make up a third of the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.
4. DARDLEA is therefore concerned that the proposed location of the Emvelo Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.

5. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified to date include the location of turbines in areas identified in the Faunal Assessment as High Sensitivity and High Sensitivity Escarpment, the location of turbines and associated infrastructure in bat sensitive and bat no-go areas, the location of the laydown area in a sensitive aquatic feature, and the location of a number of turbines in avifaunal exclusion zones. It must be noted though that in addition to the exclusion zones identified in the specialist studies, a number of turbines as well as associated substation and laydown areas are still be located in Key Biodiversity Areas and IBAs (i.e. turbines 4, 8, 11, 18, 19, 22, 24, 26, 31, 33 and 35), Intact Grassland Patches (including turbines 1-6 9 and 13), and CBA Irreplaceable areas (12, 14, 16, 17, 29, 32 and 33) and CBA optimal areas (8, 18 and 19), which is very concerning.
6. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. Currently, these include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Mukondeleli WEF (authorised), Zephyr WEF (within 30km), as well as Camden I and II, Sheepmoor WEF and Rochdale WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
7. Roads must be included in the draft layout plan, and must be incorporated in the impact analysis.
8. The plan of study for EIA must include and address the following:
   8.1 Terrestrial Biodiversity:
      - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
      - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (i.e. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
      - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
      - The impact of the potential loss of ecological drivers on ecological processes must be analysed i.e. fire, which is an important driver for the maintenance of grassland biodiversity.
   8.2 Avifauna: DARDLEA supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:
      - The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide shaped buffers for such features), additional monitoring must be undertaken to

confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.

- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

8.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

8.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

9. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
10. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
11. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
12. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE ROCHDALE WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON PORTIONS 1, 2 & 5 OF THE FARM SCHIMMELHOEK 272 IT, PORTIONS 3, 6, 7, 8 & 13 OF THE FARM ONVERWACHT 273 IT, PORTION 3 OF THE FARM ONVERWACHT 287 IT, PORTIONS 1, 2, 9 & 10 OF THE FARM ZWARTWATER 288 IT, PORTIONS 6, 10, 11 & RE/3 OF THE FARM WELTEVREDEN 289 IT, AND PORTION RE/7 OF THE FARM WITPUNT 267 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Rochdale Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 66%)**, Intact Grassland Patches, Key Biodiversity Areas **(79.7%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered), and the northern, southern, and western borders of the site fall close to three different Important Bird Areas.
2. The proposed development is within a 30km radius of four (4) nature reserves i.e. Ahlers, Langcarel, Josua Moolman, and Laughing Waters Private Nature Reserves. The Chrissiesmeer Protected Environment **is within 5km** of the proposed site.
3. The proposed Rochdale WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered), Denham's Bustard (Globally Near Threatened, Regionally Vulnerable), Secretarybird (Globally Endangered, Regionally Vulnerable), White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened), Grey Crowned Crane (Globally and Regionally Endangered), Martial Eagle (Globally and Regionally Endangered), Lanner Falcon (Regionally Vulnerable), Greater Flamingo (Regionally Near Threatened), Southern Bald Ibis (Regionally and Globally Vulnerable), Cape Vulture (Globally Vulnerable and Regionally Endangered), and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
4. DARDLEA is therefore concerned that the location of the Rochdale Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.
5. Furthermore, **intact grassland patches** are located within the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland

patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.

6. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified in the specialist reports to date include: the laydown areas in bat sensitive areas; the location of the substation and O&M buildings in sensitive aquatic areas; and the location of all but 3 turbines in avifaunal exclusion zones. It must be noted though, that these 3 turbines are all still located in **Key Biodiversity Areas (KBAs)**, and one of them (WTG5) is in a CBA Irreplaceable area. Furthermore, all associated infrastructure (laydown areas, transmission lines, substation) is located in KBAs, and the laydown areas are in CBA Irreplaceable areas. The location of turbines and associated infrastructure in KBAs and CBA Irreplaceable areas is not supported.
7. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. Currently these include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Zephyr WEF (within 30km), Mukondeleli WEF (authorised) as well as Camden I and II, Sheepmoor WEF and Emvelo WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
8. Roads must be included in the draft layout plan, and must be incorporated in the impact analysis.
9. The plan of study for EIA must include and address the following:
   - 9.1 Terrestrial Biodiversity:
     - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
     - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (ie. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
     - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
     - The impact of the potential loss of ecological drivers on ecological processes must be analysed ie. fire, which is an important driver for the maintenance of grassland biodiversity.
   - 9.2 Avifauna: DARDLEA supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:
     - The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide

shaped buffers for such features), additional monitoring must be undertaken to confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.

- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

9.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

9.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

10. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
11. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
12. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
13. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE SHEEPMOOR WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON VARIOUS PORTIONS OF THE FARMS ONVERWACHT 273 IT, ONVERWACHT 287 IT, WAAIHOEK 286 IT, WINDHOEK291 IT, ZWARTWATER 288 IT, WELTERVREDEN 289 IT, WELTERVREDEN 290 IT, MOOIPLAATS 290 IT, WITPUNT 267 IT AND CAMDEN POWER STATION 329 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Sheepmoor Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 28%)**, Intact Grassland Patches **(36%),** Key Biodiversity Areas **(9.3%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered). Furthermore, 84% of the site falls within Grasslands SA020, Important Bird Area (IBA), and close to two other Important Bird Areas.
2. The proposed Sheepmoor WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered); Denham's Bustard (Globally Near Threatened, Regionally Vulnerable); Secretarybird (Globally Endangered, Regionally Vulnerable); White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened); Grey Crowned Crane (Globally and Regionally Endangered); Martial Eagle (Globally and Regionally Endangered); Lanner Falcon (Regionally Vulnerable); Greater Flamingo (Regionally Near Threatened); Southern Bald Ibis (Regionally and Globally Vulnerable); Cape Vulture (Globally Vulnerable and Regionally Endangered); and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
4. Furthermore, **intact grassland patches** make up **36%** of the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.

5. The proposed Sheepmoor WEF development is within a 10km-30km radius of three protected private nature reserves (Ahlers, Langcarel and Josua Moolman), and the Chrissiesmeer Protected Environment is within 10km of the proposed site.
6. DARDLEA is therefore concerned that the proposed location of the Sheepmoor Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.
7. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified in the specialist reports to date include: the location of laydown areas, O&M Buildings and a substation in avian exclusion zones; the location of the substation and O&M Buildings in a sensitive aquatic area; the location of infrastructure within areas of High faunal sensitivity; the location of the Laydown Area, O&M buildings and the Alternative substation within in no-go bat areas; and the location of all but 3 turbines in avifaunal exclusion zones. It must be noted also that the substation, laydown area, and at least 13 turbines are located in intact grassland patches, and all but 6 turbines are located in an IBA, which is very concerning.
8. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. These include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Zephyr WEF (within 30km), as well as Camden I and II, Emvelo WEF and Rochdale WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
9. Roads to be developed must be included in the draft layout plan, and must be incorporated in the impact analysis.
10. The plan of study for EIA must include and address the following:
    10.1 Terrestrial Biodiversity:
        - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
        - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (ie. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
        - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
        - The impact of the potential loss of ecological drivers on ecological processes must be analysed ie. fire, which is an important driver for the maintenance of grassland biodiversity.
    10.2 Avifauna: DARDLEA supports the supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:

- The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide shaped buffers for such features), additional monitoring must be undertaken to confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.
- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting

however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

10.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

10.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

11. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
12. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
13. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
14. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE EMVELO WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON VARIOUS PORTIONS OF THE FARMS SCHIEDAM 274 IT, VAALBANK 285 IT, WAALHOEK 286 IT, KLIPFONTEIN 283 IT, BOSJESSPRUIT 291 IT, ONVERWACHT 273 IT, ZWARTWATER 288 IT, WELTEVREDEN 289 IT, WITPUT AND MOOIPLAATS 290 IT AND CAMDEN POWER STATION 329 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Emvelo Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 21%)**, Intact Grassland Patches **(33%)**, Key Biodiversity Areas **(21.4%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered). Furthermore, 43% of the site falls within Grasslands SA020 Important Bird Area (IBA), and close to two other Important Bird Areas.
2. The proposed Emvelo WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered); Denham's Bustard (Globally Near Threatened, Regionally Vulnerable); Secretary bird (Globally Endangered, Regionally Vulnerable); White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened); Grey Crowned Crane (Globally and Regionally Endangered); Martial Eagle (Globally and Regionally Endangered); Lanner Falcon (Regionally Vulnerable); Greater Flamingo (Regionally Near Threatened); Southern Bald Ibis (Regionally and Globally Vulnerable); Cape Vulture (Globally Vulnerable and Regionally Endangered); and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
3. Furthermore, intact grassland patches make up a third of the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.
4. DARDLEA is therefore concerned that the proposed location of the Emvelo Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.

5. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified to date include the location of turbines in areas identified in the Faunal Assessment as High Sensitivity and High Sensitivity Escarpment, the location of turbines and associated infrastructure in bat sensitive and bat no-go areas, the location of the laydown area in a sensitive aquatic feature, and the location of a number of turbines in avifaunal exclusion zones. It must be noted though that in addition to the exclusion zones identified in the specialist studies, a number of turbines as well as associated substation and laydown areas are still be located in Key Biodiversity Areas and IBAs (i.e. turbines 4, 8, 11, 18, 19, 22, 24, 26, 31, 33 and 35), Intact Grassland Patches (including turbines 1-6 9 and 13), and CBA Irreplaceable areas (12, 14, 16, 17, 29, 32 and 33) and CBA optimal areas (8, 18 and 19), which is very concerning.
6. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. Currently, these include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Mukondeleli WEF (authorised), Zephyr WEF (within 30km), as well as Camden I and II, Sheepmoor WEF and Rochdale WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
7. Roads must be included in the draft layout plan, and must be incorporated in the impact analysis.
8. The plan of study for EIA must include and address the following:
   8.1 Terrestrial Biodiversity:
      - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
      - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (i.e. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
      - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
      - The impact of the potential loss of ecological drivers on ecological processes must be analysed i.e. fire, which is an important driver for the maintenance of grassland biodiversity.
   8.2 Avifauna: DARDLEA supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:
      - The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide shaped buffers for such features), additional monitoring must be undertaken to

confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.

- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

8.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

8.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

9. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
10. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
11. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
12. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE ROCHDALE WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON PORTIONS 1, 2 & 5 OF THE FARM SCHIMMELHOEK 272 IT, PORTIONS 3, 6, 7, 8 & 13 OF THE FARM ONVERWACHT 273 IT, PORTION 3 OF THE FARM ONVERWACHT 287 IT, PORTIONS 1, 2, 9 & 10 OF THE FARM ZWARTWATER 288 IT, PORTIONS 6, 10, 11 & RE/3 OF THE FARM WELTEVREDEN 289 IT, AND PORTION RE/7 OF THE FARM WITPUNT 267 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Rochdale Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 66%)**, Intact Grassland Patches, Key Biodiversity Areas **(79.7%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered), and the northern, southern, and western borders of the site fall close to three different Important Bird Areas.
2. The proposed development is within a 30km radius of four (4) nature reserves i.e. Ahlers, Langcarel, Josua Moolman, and Laughing Waters Private Nature Reserves. The Chrissiesmeer Protected Environment **is within 5km** of the proposed site.
3. The proposed Rochdale WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered), Denham's Bustard (Globally Near Threatened, Regionally Vulnerable), Secretarybird (Globally Endangered, Regionally Vulnerable), White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened), Grey Crowned Crane (Globally and Regionally Endangered), Martial Eagle (Globally and Regionally Endangered), Lanner Falcon (Regionally Vulnerable), Greater Flamingo (Regionally Near Threatened), Southern Bald Ibis (Regionally and Globally Vulnerable), Cape Vulture (Globally Vulnerable and Regionally Endangered), and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
4. DARDLEA is therefore concerned that the location of the Rochdale Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.
5. Furthermore, **intact grassland patches** are located within the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland

patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.

6. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified in the specialist reports to date include: the laydown areas in bat sensitive areas; the location of the substation and O&M buildings in sensitive aquatic areas; and the location of all but 3 turbines in avifaunal exclusion zones. It must be noted though, that these 3 turbines are all still located in **Key Biodiversity Areas (KBAs)**, and one of them (WTG5) is in a CBA Irreplaceable area. Furthermore, all associated infrastructure (laydown areas, transmission lines, substation) is located in KBAs, and the laydown areas are in CBA Irreplaceable areas. The location of turbines and associated infrastructure in KBAs and CBA Irreplaceable areas is not supported.
7. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. Currently these include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Zephyr WEF (within 30km), Mukondeleli WEF (authorised) as well as Camden I and II, Sheepmoor WEF and Emvelo WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
8. Roads must be included in the draft layout plan, and must be incorporated in the impact analysis.
9. The plan of study for EIA must include and address the following:
   - 9.1 Terrestrial Biodiversity:
     - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
     - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (ie. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
     - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
     - The impact of the potential loss of ecological drivers on ecological processes must be analysed ie. fire, which is an important driver for the maintenance of grassland biodiversity.
   - 9.2 Avifauna: DARDLEA supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:
     - The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide

shaped buffers for such features), additional monitoring must be undertaken to confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.

- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

9.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

9.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

10. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
11. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
12. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
13. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE SHEEPMOOR WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON VARIOUS PORTIONS OF THE FARMS ONVERWACHT 273 IT, ONVERWACHT 287 IT, WAAIHOEK 286 IT, WINDHOEK291 IT, ZWARTWATER 288 IT, WELTERVREDEN 289 IT, WELTERVREDEN 290 IT, MOOIPLAATS 290 IT, WITPUNT 267 IT AND CAMDEN POWER STATION 329 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Sheepmoor Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 28%)**, Intact Grassland Patches **(36%),** Key Biodiversity Areas **(9.3%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered). Furthermore, 84% of the site falls within Grasslands SA020, Important Bird Area (IBA), and close to two other Important Bird Areas.
2. The proposed Sheepmoor WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered); Denham's Bustard (Globally Near Threatened, Regionally Vulnerable); Secretarybird (Globally Endangered, Regionally Vulnerable); White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened); Grey Crowned Crane (Globally and Regionally Endangered); Martial Eagle (Globally and Regionally Endangered); Lanner Falcon (Regionally Vulnerable); Greater Flamingo (Regionally Near Threatened); Southern Bald Ibis (Regionally and Globally Vulnerable); Cape Vulture (Globally Vulnerable and Regionally Endangered); and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
4. Furthermore, **intact grassland patches** make up **36%** of the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.

5. The proposed Sheepmoor WEF development is within a 10km-30km radius of three protected private nature reserves (Ahlers, Langcarel and Josua Moolman), and the Chrissiesmeer Protected Environment is within 10km of the proposed site.
6. DARDLEA is therefore concerned that the proposed location of the Sheepmoor Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.
7. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified in the specialist reports to date include: the location of laydown areas, O&M Buildings and a substation in avian exclusion zones; the location of the substation and O&M Buildings in a sensitive aquatic area; the location of infrastructure within areas of High faunal sensitivity; the location of the Laydown Area, O&M buildings and the Alternative substation within in no-go bat areas; and the location of all but 3 turbines in avifaunal exclusion zones. It must be noted also that the substation, laydown area, and at least 13 turbines are located in intact grassland patches, and all but 6 turbines are located in an IBA, which is very concerning.
8. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. These include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Zephyr WEF (within 30km), as well as Camden I and II, Emvelo WEF and Rochdale WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
9. Roads to be developed must be included in the draft layout plan, and must be incorporated in the impact analysis.
10. The plan of study for EIA must include and address the following:
    10.1 Terrestrial Biodiversity:
        - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
        - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (ie. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
        - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
        - The impact of the potential loss of ecological drivers on ecological processes must be analysed ie. fire, which is an important driver for the maintenance of grassland biodiversity.
    10.2 Avifauna: DARDLEA supports the supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:

- The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide shaped buffers for such features), additional monitoring must be undertaken to confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.
- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting

however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

10.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

10.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

11. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
12. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
13. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
14. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

Hi Lloyd,

We have gone through the comments and are happy to meet sometime during the course of today to discuss the way forward. Please would you let us know a suitable time today to meet.

Thank you,

ERM
Sustainability is our business

EXTERNAL MESSAGE

Good day team,

Please advise if we require a meeting to discuss these comments.

Noting that specialist responses will be required.

Please can we mobilise on this asap.

Kind Regards,

Lloyd Barnes

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE EMVELO WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON VARIOUS PORTIONS OF THE FARMS SCHIEDAM 274 IT, VAALBANK 285 IT, WAALHOEK 286 IT, KLIPFONTEIN 283 IT, BOSJESSPRUIT 291 IT, ONVERWACHT 273 IT, ZWARTWATER 288 IT, WELTEVREDEN 289 IT, WITPUT AND MOOIPLAATS 290 IT AND CAMDEN POWER STATION 329 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Emvelo Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 21%)**, Intact Grassland Patches **(33%)**, Key Biodiversity Areas **(21.4%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered). Furthermore, 43% of the site falls within Grasslands SA020 Important Bird Area (IBA), and close to two other Important Bird Areas.
2. The proposed Emvelo WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered); Denham's Bustard (Globally Near Threatened, Regionally Vulnerable); Secretary bird (Globally Endangered, Regionally Vulnerable); White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened); Grey Crowned Crane (Globally and Regionally Endangered); Martial Eagle (Globally and Regionally Endangered); Lanner Falcon (Regionally Vulnerable); Greater Flamingo (Regionally Near Threatened); Southern Bald Ibis (Regionally and Globally Vulnerable); Cape Vulture (Globally Vulnerable and Regionally Endangered); and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
3. Furthermore, intact grassland patches make up a third of the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.
4. DARDLEA is therefore concerned that the proposed location of the Emvelo Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.

5. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified to date include the location of turbines in areas identified in the Faunal Assessment as High Sensitivity and High Sensitivity Escarpment, the location of turbines and associated infrastructure in bat sensitive and bat no-go areas, the location of the laydown area in a sensitive aquatic feature, and the location of a number of turbines in avifaunal exclusion zones. It must be noted though that in addition to the exclusion zones identified in the specialist studies, a number of turbines as well as associated substation and laydown areas are still be located in Key Biodiversity Areas and IBAs (i.e. turbines 4, 8, 11, 18, 19, 22, 24, 26, 31, 33 and 35), Intact Grassland Patches (including turbines 1-6 9 and 13), and CBA Irreplaceable areas (12, 14, 16, 17, 29, 32 and 33) and CBA optimal areas (8, 18 and 19), which is very concerning.
6. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. Currently, these include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Mukondeleli WEF (authorised), Zephyr WEF (within 30km), as well as Camden I and II, Sheepmoor WEF and Rochdale WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
7. Roads must be included in the draft layout plan, and must be incorporated in the impact analysis.
8. The plan of study for EIA must include and address the following:
   8.1 Terrestrial Biodiversity:
      - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
      - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (i.e. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
      - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
      - The impact of the potential loss of ecological drivers on ecological processes must be analysed i.e. fire, which is an important driver for the maintenance of grassland biodiversity.
   8.2 Avifauna: DARDLEA supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:
      - The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide shaped buffers for such features), additional monitoring must be undertaken to

confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.

- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

8.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

8.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

9. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
10. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
11. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
12. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE ROCHDALE WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON PORTIONS 1, 2 & 5 OF THE FARM SCHIMMELHOEK 272 IT, PORTIONS 3, 6, 7, 8 & 13 OF THE FARM ONVERWACHT 273 IT, PORTION 3 OF THE FARM ONVERWACHT 287 IT, PORTIONS 1, 2, 9 & 10 OF THE FARM ZWARTWATER 288 IT, PORTIONS 6, 10, 11 & RE/3 OF THE FARM WELTEVREDEN 289 IT, AND PORTION RE/7 OF THE FARM WITPUNT 267 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Rochdale Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 66%)**, Intact Grassland Patches, Key Biodiversity Areas **(79.7%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered), and the northern, southern, and western borders of the site fall close to three different Important Bird Areas.
2. The proposed development is within a 30km radius of four (4) nature reserves i.e. Ahlers, Langcarel, Josua Moolman, and Laughing Waters Private Nature Reserves. The Chrissiesmeer Protected Environment **is within 5km** of the proposed site.
3. The proposed Rochdale WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered), Denham's Bustard (Globally Near Threatened, Regionally Vulnerable), Secretarybird (Globally Endangered, Regionally Vulnerable), White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened), Grey Crowned Crane (Globally and Regionally Endangered), Martial Eagle (Globally and Regionally Endangered), Lanner Falcon (Regionally Vulnerable), Greater Flamingo (Regionally Near Threatened), Southern Bald Ibis (Regionally and Globally Vulnerable), Cape Vulture (Globally Vulnerable and Regionally Endangered), and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
4. DARDLEA is therefore concerned that the location of the Rochdale Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.
5. Furthermore, **intact grassland patches** are located within the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland

patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.

6. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified in the specialist reports to date include: the laydown areas in bat sensitive areas; the location of the substation and O&M buildings in sensitive aquatic areas; and the location of all but 3 turbines in avifaunal exclusion zones. It must be noted though, that these 3 turbines are all still located in **Key Biodiversity Areas (KBAs)**, and one of them (WTG5) is in a CBA Irreplaceable area. Furthermore, all associated infrastructure (laydown areas, transmission lines, substation) is located in KBAs, and the laydown areas are in CBA Irreplaceable areas. The location of turbines and associated infrastructure in KBAs and CBA Irreplaceable areas is not supported.
7. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. Currently these include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Zephyr WEF (within 30km), Mukondeleli WEF (authorised) as well as Camden I and II, Sheepmoor WEF and Emvelo WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
8. Roads must be included in the draft layout plan, and must be incorporated in the impact analysis.
9. The plan of study for EIA must include and address the following:
   - 9.1 Terrestrial Biodiversity:
     - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
     - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (ie. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
     - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
     - The impact of the potential loss of ecological drivers on ecological processes must be analysed ie. fire, which is an important driver for the maintenance of grassland biodiversity.
   - 9.2 Avifauna: DARDLEA supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:
     - The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide

shaped buffers for such features), additional monitoring must be undertaken to confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.

- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

9.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

9.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

10. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
11. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
12. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
13. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

MS. R. LUYT

Dear Madam,

DRAFT SCOPING REPORT: ACTIVITIES ASSOCIATED WITH THE SHEEPMOOR WIND ENERGY FACILITY AND ASSOCIATED GRID CONNECTION ON VARIOUS PORTIONS OF THE FARMS ONVERWACHT 273 IT, ONVERWACHT 287 IT, WAAIHOEK 286 IT, WINDHOEK291 IT, ZWARTWATER 288 IT, WELTERVREDEN 289 IT, WELTERVREDEN 290 IT, MOOIPLAATS 290 IT, WITPUNT 267 IT AND CAMDEN POWER STATION 329 IT, ERMELO, MSUKALIGWA LOCAL MUNICIPALITY

The draft scoping report which was submitted by you in respect of the abovementioned application and received by the Department on 27 August 2024 has reference. The Department has considered the content of the report, and has the following comments:

1. The proposed Sheepmoor Wind Energy Facility and associated grid infrastructure is located in areas identified as CBA Irreplaceable and Optimal **(over 28%)**, Intact Grassland Patches **(36%),** Key Biodiversity Areas **(9.3%)**, ESAs, Priority Focus Areas, Freshwater Ecosystem Priority Areas and Threatened Ecosystems (Endangered). Furthermore, 84% of the site falls within Grasslands SA020, Important Bird Area (IBA), and close to two other Important Bird Areas.
2. The proposed Sheepmoor WEF and associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered); Denham's Bustard (Globally Near Threatened, Regionally Vulnerable); Secretarybird (Globally Endangered, Regionally Vulnerable); White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened); Grey Crowned Crane (Globally and Regionally Endangered); Martial Eagle (Globally and Regionally Endangered); Lanner Falcon (Regionally Vulnerable); Greater Flamingo (Regionally Near Threatened); Southern Bald Ibis (Regionally and Globally Vulnerable); Cape Vulture (Globally Vulnerable and Regionally Endangered); and Yellow-breasted Pipit (Regionally and Globally Vulnerable).
4. Furthermore, **intact grassland patches** make up **36%** of the site footprint. DARDLEA does not support the development of WEFs (or any non-compatible land use) within intact grassland patches. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal. Intact grasslands are crucial for supporting threatened avifauna.

5. The proposed Sheepmoor WEF development is within a 10km-30km radius of three protected private nature reserves (Ahlers, Langcarel and Josua Moolman), and the Chrissiesmeer Protected Environment is within 10km of the proposed site.
6. DARDLEA is therefore concerned that the proposed location of the Sheepmoor Wind Energy Facility and associated grid infrastructure is not compatible with the desired land use. The WEF and all associated infrastructure is not a land use, in accordance with the Mpumalanga Biodiversity Sector Plan (MBSP), that will support the inherent biodiversity values of CBAs.
7. It is acknowledged that the layout plan in the draft Scoping Report is preliminary, and that you have confirmed that it will be revised further during the EIA phase to be informed by buffers and constraints provided by specialists. Such constraints identified in the specialist reports to date include: the location of laydown areas, O&M Buildings and a substation in avian exclusion zones; the location of the substation and O&M Buildings in a sensitive aquatic area; the location of infrastructure within areas of High faunal sensitivity; the location of the Laydown Area, O&M buildings and the Alternative substation within in no-go bat areas; and the location of all but 3 turbines in avifaunal exclusion zones. It must be noted also that the substation, laydown area, and at least 13 turbines are located in intact grassland patches, and all but 6 turbines are located in an IBA, which is very concerning.
8. We are concerned that cumulative impacts will not be dealt with adequately. While the Department of Fisheries, Forestry and the Environment has set a limit of 30km for the assessment of cumulative impacts, this should be viewed as a minimum requirement. Due to the extremely sensitive habitat within which all wind farms in the region have either been authorised or are currently in process, it is our view that all authorised and in-process wind farms in the Gert Sibande District should be included in the assessment of cumulative impacts. These include Ujekamanzi WEF 1, Ujekamanzi WEF 2, Ummbila Emoyeni WEF (authorised, and within 55km); Phefumula Emoyeni WEF (within 40km); Zephyr WEF (within 30km), as well as Camden I and II, Emvelo WEF and Rochdale WEF. The cumulative assessment must, *inter alia*, identify the species and habitats most at risk of cumulative impacts, and identify key uncertainties. The definition of cumulative impacts as per the EIA Regulations is "the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may be significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities". A comparative assessment of the impacts of this proposed facility, in relation to and in conjunction with, adjacent and surrounding renewable energy facilities should therefore be provided in the EIA Report.
9. Roads to be developed must be included in the draft layout plan, and must be incorporated in the impact analysis.
10. The plan of study for EIA must include and address the following:
    10.1 Terrestrial Biodiversity:
        - Intact Grassland Patches and Key Biodiversity Areas must be identified and considered in the analysis of impacts on terrestrial biodiversity.
        - Where infrastructure is to be developed in CBAs and Intact Grassland Patches, the impact of the loss of CBAs and intact grassland habitat in terms of metapopulation dynamics (ie. how the loss of source areas will impact areas of low quality habitat that cannot support a population of species on its own) must be assessed.
        - The Site Ecological Importance methodology, as per the requirements of the Species Environmental Assessment Guidelines, must be demonstrated to have been applied.
        - The impact of the potential loss of ecological drivers on ecological processes must be analysed ie. fire, which is an important driver for the maintenance of grassland biodiversity.
    10.2 Avifauna: DARDLEA supports the supports the avifaunal specialists' recommendations to remove turbines from the "exclusion zones" identified during pre-construction monitoring. However, in the proposed re-assessment of the layout, the Avifaunal Assessment must consider and include the following:

- The Birds and Wind-Energy Best-Practice Guidelines state that the duration of pre-construction monitoring should be extended (beyond 12 months) where there is a high risk of significant impacts on priority species. Sufficient evidence of high risk of significant impact on avifauna on site and within the Project Area of Influence exists to extend minimum pre-construction monitoring requirements to adequately assess impacts and determine appropriate mitigation measures. Where the layout of the proposed wind farm does not avoid all sensitive features, corridors and buffers (e.g. CBAs, intact grasslands patches, KBAs, pans and all waterbodies, and provide shaped buffers for such features), additional monitoring must be undertaken to confirm the full spectrum of prevailing environmental conditions to ensure avoidance of significant impacts.
- Intact grassland patches are important habitat for foraging, and facilitate avifauna breeding and movement. Intact grassland patches must be considered and incorporated in the analysis of impact zones applicable to avifauna.
- Buffers for waterbodies / aquatic features – confirm the rationale in their determination and how their sizes (210m around drainage lines, and 110m around wetland no-go zones) were determined to be sufficient to account for movement of birds through the site, and protection of roosting areas and flight behaviours (approaching and leaving roost sites, foraging sites etc).
- DARDLEA is especially concerned that the site comprises habitat suitable for species with low detection probability, including the Globally Vulnerable Yellow-breasted Pipit, and Endangered Rudd's Lark, and the Critically Endangered Species 23. The precautionary principle must be applied in the undertaking of comprehensive habitat-based assessments in order to robustly delineate flyways and movement corridors for these species.
- Confirmation of compliance with vantage point requirements. Based on our viewshed analysis it appears that only 45-50% of the site is covered vs the required 75%, and that some turbines have been located outside of vantage point visibility.
- DARDLEAs position is that blade painting will be a non-negotiable, compulsory requirement for all authorised wind farms in the province, and Shut Down on Demand (SDoD) would be a compulsory adaptive management requirement. However, since neither of these measures are effective for night flying birds, which have been confirmed on and adjacent to the site, a separate operational impact analysis must be undertaken for "Mortality of priority night flying species due to collisions with the wind turbines".
- The night-flying greater flamingo was confirmed on site, and there is currently no known technology to mitigate for the collision of night flying birds.
- Due to the sensitivity of avifauna using the area, and the presence of pans and wetlands on and adjacent to the site, as well as the presence of night-flying birds, tracking data should be acquired to augment the 2D models used.
- Surveys and tracking should be undertaken to determine the collision risks for nocturnal species.
- A site-specific list of priority avifaunal species for wind farms for this particular region must be developed, which must include all wetland species (noting that the priority species list published by BirdLife South Africa in 2012 does not include most wetland species, and did not include Mpumalanga).
- Appropriate fatality thresholds (turbine collision, as well as power line collision and electrocution) need to be defined and agreed on **within and as part of the EIA process**, which must then be incorporated into the impact analysis.
- It is acknowledged that the Martial Eagle nest turbine no-go buffer is currently being investigated further with detailed modelling and additional survey work, to inform the final no-go area during the EIA phase. Latest available information from literature, specialists and BirdLife must be consulted during this exercise. This must include BirdLife's and EWT's recommendations of 5-6km buffer for Martial Eagle nests, noting

however that Martial Eagles are known to have large breeding territories, and any buffer must be supported by the birds' actual use of an area.

10.3 Bat Assessment

- Appropriate fatality thresholds need to be defined and agreed on within the EIA process and incorporated in the impact analysis.
- Separate mitigation measures need to be considered in more detail for high-flying bat species (i.e. Egyptian Free-Tailed bat) and lower-level bat species (e.g. Cape Serotine) in the EIA, i.e. different turbine design, blade / rotor sweep size and height, should be investigated for the specific wind turbines located adjacent to areas where these different bat species occur.

10.4 Microclimate Impact Assessment

- Research has demonstrated that turbines can affect the conditions required for mist formation, and that wind farms warm the land surface, especially at night. Altered microclimates will affect the conditions that support the highveld grasslands. Biodiversity and agricultural potential will potentially be affected. A Microclimate Impact Assessment must be undertaken, which must inform the terrestrial biodiversity study as well as the Agricultural Assessment. The impact of this WEF on the micro-climate, in particular the potential impact on precipitation, soil moisture, soil temperature, etc. therefore also needs to be assessed as part of the EIA.

11. All relevant stakeholders, including but not limited to, BirdLife SA, Mpumalanga Tourism and Parks Agency (MTPA), Gert Sibande District Municipality (GSDM), Department of Agriculture, Land Reform and Rural Development (DALRRD), Department of Public Works, Roads and Transport (DPWRT), and Msukaligwa Local Municipality must be must be consulted and provided with an opportunity of at least 30 days to submit comments.
12. The public participation process must be demonstrated to have been conducted in accordance with Regulations 39 – 44 of the EIA Regulations, 2014 (as amended).
13. Please provide this Department with an opportunity to review and engage with your response to these comments prior to the submission the final scoping report.
14. We are concerned that the proposed development site is not suitable for the development of wind energy infrastructure, and do not support the layout in its current form.

Please do not hesitate to contact this office if there are any enquiries.

Sincerely,

EXTERNAL MESSAGE

Hi Lucien

Unfortunately I'm on the road today mostly off network and on a critical timeline so will not be available for 2pm. It was lucky I even received this email, I must have snuck past some network signal.

I'm also on a field trip in remote areas for almost the rest of the month, so looking at and addressing comments is likely to be a challenge before the 23rd.

I had actually archived this project as I queried a few times over the last few months without response, so had assumed it had been parked indefinately.

It seems characteristic of Mulilo to park things for months or years and then suddenly it pops up for immediate response and I cannot in good conscience now tell other clients that have well in advance planned timelines, that they must now wait because Mulilo wants a response immediately.

My apologies for being blunt about this but it happens every time and while I try and accommodate everyone including when urgent matters arise if one is going to follow this sort of approach sooner or later there is going to be a scheduling conflict.

In addition because it is parked so long I have to review all the reports to refresh myself of the specifics, which was not included in my budget or timeline.

Thank you and kind regards
Jamie

Email: ERM.ArcusAmsterdam@erm.com

Dear Ms., Gopaul

SUBJECT: THE MTPA COMMENTS ON THE DRAFT ENVIRONMENTAL SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY (WEF) (23 WIND TURBINES) AND AUXILIARY INFRASTRUCTURE (1 ON-SITE SUBSTATION WITH A CAPACITY OF 132Kv, AND 1 OVER-HEAD POWERLINE OF APPROXIMATELY 22.3 KM) ON SEVERAL PORTIONS OF FARMS COVERING AN AREA OF 5 918 HA EAST OF ERMELO FOR SHEEPMOOR WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE NUMBER TO BE PROVIDED.

With reference to your correspondence reference **Project no: 0684401** of August 2024, herewith the MTPA comments.

The application has been assessed by using the following tools: Mpumalanga Biodiversity Sector Plan (2014 as updated 2022) land use guidelines, the DFFE web-based sensitivity screening tool, Environmental legislation NEMA and EIA regulations 2014 as amended, Department of Water and Sanitation and Water Research Commission Guidelines on wetlands, the South African Heritage Resources Act and knowledge to assess Development Applications.

The sensitivity of the area, in which the prospecting activity is proposed and is likely to occur was assessed according to the Mpumalanga Biodiversity Sector plan (MBSP; MTPA, 2014). The sensitivity is assessed in terms of terrestrial and freshwater assessments. In the MBSP, sensitivity areas are identified in terms of *Critical Biodiversity Areas* (CBAs) and *Ecological Support Areas* (ESAs). CBAs and ESAs are deemed to be

necessary to ensure the protection of biodiversity, environmental sustainability and sustainable living and are to remain unaltered.

Comments with regards to the terms of reference for studies needed:

With reference to the assessment of your Draft Scoping Report the MTPA is concerned about the following issues raised with regards to the terms of reference for specialist studies to be done.

1. The alternative sites, although less sensitive to the preferred site, are still located in sensitive areas.
2. Ground truthing and on-site studying of areas regarded as degraded or sensitive and suitable for potential wind turbines must be done considering that cultivated/vegetated lands might be feeding areas for many Species of Conservation Concern. The Site sensitivity verification report must include the feeding areas for SCC.
3. The avoidance of large areas of critical biodiversity terrestrial and freshwater sensitivity areas and the preliminary project layout overlain area is a large concern especially in the southeastern part of the study area.
4. The threat of this WEF to the Important Bird Area and the status of globally threatened bird species such as the Southern Bald Ibis and Secretary bird is of concern. The onsite avifaunal study must include local knowledge of the distribution of large birds especially the Blue crane that is a local migrant during the wintertime.
5. Included in the MTPA's comments are the following discussion that illustrates the **need and desirability** of this proposal:

Renewable energy applications

- Given the energy needs of the country, significant emphasis is being placed on the need to transition away from coal towards renewable energy. However, the urgency and desire to approve nearly all renewable energy applications needs to be put into perspective considering the incredible investment and proliferation of new renewable energy projects within Mpumalanga.
- The MTPA and DARDLEA are maintaining a database of renewable energy projects, which include those in the pre-application phase. We can confirm that 61 renewable energy projects have now been submitted within Mpumalanga. Just over 50% of these have been approved to date. 18 of these are for Wind Energy Farms, which together make up for over 233 000 ha, and this amount is growing as the province is being inundated with renewable energy applications.
- The explosion of renewable energy applications does require careful consideration as to the likely impacts. There is no shortage of renewable energy projects within the Province and the Province has room to apply its mind and navigate this space carefully. The province has now over 300 000 ha of renewable energy applications, and the many more than are still to be submitted.

Mpumalanga Biodiversity Sector Plan (MBSP), Intact Grassland Patches and Important Bird Areas (IBAs)

- The project **footprint overlaps with a significant amount of Critical Biodiversity Areas** (CBA). 1 488.9 ha (over 28%) of the footprint area is identified as a CBA. Wind farms are not appropriate land uses within CBA areas. Two proposed wind turbines are placed in CBA Irreplaceable areas.
- The MBSP Terrestrial assessment indicates that the project footprint is within CBA: Irreplaceable, CBA: Optimal, ESA: Local Corridor, ESA: Landscape Corridor, ESA: Species Specific, Other Natural Areas, Moderately Modified, and Heavily Modified Areas.
- The MBSP Freshwater Assessment indicates that the project footprint is within ESA: Strategic Water Source Areas, and has CBA: Aquatic River, ESA: Wetland Clusters, ESA: Wetlands, ESA: Important Sub-catchments, Other Natural and Heavily Modified Areas.
- ESA: Strategic Water Source Area (SWSAs) maintain ecological integrity across the entire sub-catchment, paying particular attention to maintaining water quality, water quantity, and habitat integrity. They represent 10% of the surface area producing approximately 50% of Mpumalanga's water. The proposed WEF activity in the area might compromise the quality and quantity of the surface water resources through siltation.
- The whole of the proposed Sheepmoor wind farm falls within an Important Bird Area (IBA), which underscores the need to consider its implications on metapopulation dynamics and the need to avoid wind farms in "source" areas.
- The project area mainly falls within the Mesic Eastern Highveld Grassland (Endangered). A high proportion of this vegetation type is threatened and is generally poorly protected. Hence, it should be carefully managed for the persistence of biodiversity; large areas of natural habitat are needed for many bird species, plants, and numerous wetlands that the Mesic Highveld Grassland supports.
- The proposed project area has a portion of Wakkerstroom Montane Grassland (Least Concern). A variety of land-uses are supported by this area and the conservation and good management of this area depends on the continued land-uses practices that have been able to support this biodiversity. The importance of sustainable development is crucial to the long-term maintenance of the biodiversity and ecosystem services in this area.
- 2 143.6 ha (36 %) of the proposed wind farm is comprised of intact grassland patches. With only 51% of the grasslands remaining in a natural state, very little intact natural grasslands still occur in Mpumalanga. Three proposed wind turbines are placed in intact grassland patches.
- Intact grassland patches are areas larger than 100ha, with little or no gaps or edge effects. They were then prioritised according to their connectivity importance. These intact grasslands are "source" areas for avifaunal species where birth rates are expected to exceed death rates, and no wind farms should be placed anywhere near these intact grassland patches.
- The identification of actual avifaunal source areas may be difficult, but as these intact grassland patches occur within an Important Bird Area (IBA) where there are several nesting and roosting avifaunal species of conservation concern, it highlights their significance and our confidence in confirming these as "source" areas. The presence of these intact grassland patches, CBAs, and the IBAs, is probably the biggest concern that the MTPA may have about the proposed wind farm.

- 84 % of the proposed study area is Important Bird Area and 9.3% of the proposed study area is a Key Biodiversity Area.
- Wind farms are not to be placed in IBAs or intact grassland areas as these are important areas where avifauna should be allowed to thrive and then disperse to other areas.
- Approval of the project in such a location could have far-reaching consequences for threatened bird species, potentially disrupting vital source areas critical for population sustainability.
- The south of the project area falls within the National Protected Areas Expansion Strategy (NPAES) Focus Area (Moist Escarpment Grasslands). The Chrissiesmeer Protected Environment overlaps the north of the project area and Jericho Dam Nature Reserve overlaps the eastern part of the project area.
- It is imperative to adopt a precautionary approach and prioritize the conservation of these essential habitats.

Avifaunal concerns

- **Thirteen out of the 23 proposed wind turbines are placed within the 5 km buffer of a Martial Eagles' recommended buffer these should be removed.**
- 26% of the proposed wind turbines are not covered by vantage points.
- The presence of priority bird species for wind energy developments were recorded within the footprint area.
- Two Southern Bald Ibis colonies (Vulnerable) occur within footprint area.
- A Secretary bird nest (Endangered) was found within this area.
- Birds are very mobile and with the proposed turbine height and blade lengths, the current proposed buffers seem inadequate.
- This raises particular concern as these birds may continuously collide with the blades of the wind turbines and the continuous loss of several of these long-lived birds every year may have a significant impact on population status.
- The artificial water bodies within the footprint area may be important for flamingos and other water-dependent birds.

Site Sensitivity Verification

- The results of the Site Sensitivity Verification confirmed that:
    - The sensitivity for the Terrestrial biodiversity impact assessment as Very High in grassland and wetland habitat.
    - Aquatic Biodiversity Impact Assessment as Very High Sensitivity
    - Plant Species Assessment as Medium Sensitivity
    - Animal Species Assessment as High Sensitivity
    - Bat Assessment Very High/High Sensitivity
    - Avifaunal Assessment as Very High/High Sensitivity.

Additional concerns

- Not all the infrastructure has been included on the map or addressed in terms of likely impact, in this case, roads.

Recommendations:

- There should be a thorough Oribi census plan in place, and it should be included in the final EIA report as the project area is home to many Oribi antelope. (Red data species dependant on healthy highveld grasslands).
- Species 23 must be accounted for, and a management plan drawn up for it since the project area is a potential site for its occurrence.
- The EWT's recommended 5 km buffer for the Martial Eagle's nest is non-negotiable and should be adhered to throughout the project lifecycle.
- The current identified Avifaunal Sensitivities map of all 'no-go' areas (Figure (I)) indicates little area for available for the wind farm. With more appropriate buffers, more field work, and all the associated infrastructure (such as roads), we cannot see how it would be possible to establish a wind farm within the footprint area.
- Increase buffer zones for endangered bird nesting sites to reflect their wider flight ranges relative to the height of the turbines.
- Consider alternative locations with less ecological sensitivity, especially considering the numerous renewable energy projects already approved in Mpumalanga.

Conclusion:

The proposed Sheepmoor Wind Energy Facility poses a significant threat to a Critical Biodiversity Areas, intact grassland patches, Important Bird areas, and the habitat of numerous threatened bird species. Relying on the information presented to date, and the desktop assessments, **it is in the MTPA's opinion that this project is fatally flawed.** The anticipated impacts on biodiversity, particularly the avifauna, is too great to support this project. More ecological assessments and exploration of alternative locations are crucial before proceeding with this project.

Please do not hesitate to contact this office if there are any inquiries.

Kind Regards

EXTERNAL MESSAGE

Hi Lucien
Highly unlikely that I can get comments by then. It is too short notice. If they require more than a sentence and if there are many it will take longer. I have been in the field for 3 weeks and have 3 weeks to go. Will see what I can do.
We still have not been paid that VO. Can you please look into it.
Regards
Gavin

In Sake: SHEEPMOOR, EMVELO AND ROCHDALE WIND ENERGIE PROJEKTE

Ingesluit vind u Publieke deelname vorm (2 bladsye) en Kommentaar (Bylaag A) (3 bladsye)

BYLAAG A

KOMMENTAAR TOV ROCKDALE, EMVELO EN SHEEPMOOR WINDPLASE

Die volgende probleme word met ontwikkeling van bogemelde windplase voorsien

1. VERSTEURING VAN KLIMAAT EN REËNVAL

Die platorand het 'n unieke reënval patroon waar die oostewind vog in lae inbring en kondenseer as reën en/of presipiteer as mis en dou sodra dit oor die plato in beweeg. Die mis en dou wat op die wyse inkom saam met die ooste wind is krities belangrik en voorkom bestuiwings probleme veral gedurende mid-somer droogtes.

Turbulensie van roterende turbine rotors verhoog vertikale vermenging van hitte en water damp wat meteorologiese kondisies windaf nadelig beinvloed, ingesluit reënval

Wind turbines veroorsaak verder aansienlike uitdroging van grond deur dit die warmer bolug af grond toe trek om sodoende grond temperature te verhoog.

Turbines verander dus lokale wind patrone wat negatiewe impak op reenval, grondvog en selfs mikro klimaat het met lang termyn gevolge op vrugbaarheid en produktiviteit van landbou grond en grasvelde.

DIE PLASING VAN DIE WINDTURBINES AAN DIE ONDERKANT VAN DIE PLATORAND SAL DUS FATAAL WEES VIR DIE OMGEWING SE KLIMAAT EN PLANTEGROEI WAT OOK MY BOERDERY VOORUITSIGTE OP DIE LANGTERMYN NADELIG SAL BEINVLOED.

2. VOËL LEWE WORD BEDREIG

Area bestaan uit unieke grasveld wat ideale habitat vir verskeie skaars en bedreigde voël spesies bied. Dit huisves ook groot verkeidenheid klein grasveld spesies wat nie eers hier genoem word nie.

Aantal verskeie bedreigde en / of beskermde spesies wat hier voorkom sluit in :

- **Breekop arende.** Broei paar het vanjaar kuiken suksesvol uitgebroei.
- **Sekretaris voels.** Verskeie ou sowel as aktiewe neste kom in in die gebied. So onlangs as Mei '24 is 'n paar met kuiken by Waaihoek opgemerk.
- **Mahem** kom verspreid oor hele gebied voor wat ook aktief broei. 'n Kuiken word gereeld saam met volwasenes opgemerk.
- **Blou Kraanvoels** is aan die toeneem met tenminste een kuiken wat jaarliks waargeneem is.
- **Visarende** besoek ook gereeld die damme in die gebied.
- **Veldpou** kom voor maar raak tans skaars. Neste in die veld is ook al opgemerk.
- **Kalkoen Ibus** is algemeen met verskeie aktiewe broei kolonies.
- Daar is positiewe tekens dat **Aasvoels** ook na die terug beweeg. Broei kolonies is by Smithfield, nie ver van die area, se kranse aktief.

- Verskeie **uil** spesie wat miskien nie bedryg is nie maar uitters noodsaaklik is om ekologiese balans te verseker is ook in groot getalle teenwoordig

Al die voëlspesies, asook vlermuise en insekte, is noodsaaklik om balans in die ekologie te behou en staar gevaar om of gedood of te verskuif na ander gebiede a.g.v.

- Noodlottige botsing met turbine lemme
- Habitat versteurings deur verhoogte grond temperature.
- Lugdruk veranderinge voor turbines asook die werwels agter turbines.
- Baie gevoelig vir lae frekwensie elektromagnetiese druk golwe deur windturbines veroorsaak wat nadelig op hul inwerk
- Uitwis van neste en selfs doodskiet daarvan om goedkeuring hindernisse te elimineer soos reeds bewys is met die skiet van 'n breekop arend.

3. DIERELEWE WORD BEDREIG

Die volgende skaars en beskermde soog diere word o.a. hier aangetref

- Oorbietjie
- Bruinhiëna
- Miershoop tier
- Aardwolf

Die diere staan gevaar om weg te beweeg deur habitat vernietiging, vibrasie en geraas deur turbines veroorsaak. Vuil elektriseteit deur windkrag geproduseer kan deur kabels en in die grond beweeg. Die grond stroom het nadelige effek op die produktiwiteit en voortplanting van soogdiere.

4. GERAAS EN VIRTUELE BESOEDELING

Wind turbines produseer klankgolwe (drukgolwe) deur die roterende lemme en word gehoor as gedruis en / of waarneembaar as infraklanke asook elektromagnetiese golwe wat gegenereer word by omskakeling van wind energie na elektrisiteit. Die omskakeling produseer swak kwaliteit krag (dirty electricity and ground current) wat nadelig op gesondheid van mens en dier is. Die skadu flikkering van turbines is ook bydraende faktor tot gesondheids probleme.

Daar is 'n besliste verband tussen die 'ground current' deur turbines geproduseer en kanker. Dit is al gedokumenteer dat leukemia by kinders met 300% toegeneem het a.g.v. daarvan.

Bogemelde kan egter nog verskeie ander kliniese gesondheids toestande by die mens aktiveer.

By diere en insekte wat lae frekwensie geluide en vibrasies beter as mens waarneem bestaan groot gevaar dat as gevolg daarvan om uit gebied te beweeg en sodoende heeltemal te verdwyn.

IN DIE LIG VAN DIE FEITE MOET 'N TURBINE EN KABEL VRYE BUFFERSONE VAN MINSTENS 1,5KM VANAF MY EIENDOM SE GRENSDRADE GEHANHAAF WORD.

Die aantal hoe turbines dra by tot virtuele besoedeling van die natuur.

5. INFRASTRUKTUUR

Die verbeterde infrastruktuur sal lei tot toename in beweging en invloei van ongewenste elemente wat misdaad drasties sal verhoog. Veediefstal by my boerdery het gestop sedert ek opgehou het om distrikpad na Sheepmoor te skraap omdat dit moeilik begaanbaar geword het.

Gedurende die konstruksie fase kan arbeids onrus verwag word a.g.v. verwagtinge wat by lokale bevolking geskep word.

Die feit dat geen turbines op my eiendom toegelaat word nie gaan my eiendom nie vrywaar van die negatiewe newe effekte van die 3 windplase nie.

DEEGLIKE VERDERE ONDERSOEKE WORD DUS VERSOEK ALVORENS GOEDKEURING DEUR DIE OWERHEID AAN PROJEK VERLEEN WORD

- **LANGTERMYN INVLOED VAN BEPLANDE WINDPLASE OP LANDBOU, KLIMAAT EN REENVAL.**

- **IDENTIFISEERING EN BEWEGINGS VAN BEDREIGDE EN BESKERMDE VOËLSPESIE ASOOK WAAR NESTE VOORKOM, AKTIEWE EN OU NESTE.**

- **IDENTIFISERING VAN DIE SKAARS SOOGDIERE ASOOK HUL BEWEGINGS IN DIE GERBIED.**

Voorsien nadelige langtermyn vooruitsigte vir die landbou en omgewing en kan dus ontwikkeling van windplase nie ONVOORWAARLIK steun nie.

Die uwe

BYLAAG A

KOMMENTAAR TOV ROCKDALE, EMVELO EN SHEEPMOOR WINDPLASE

Die volgende probleme word met ontwikkeling van bogemelde windplase voorsien

1. VERSTEURING VAN KLIMAAT EN REËNVAL

Die platorand het 'n unieke reënval patroon waar die oostewind vog in lae inbring en kondenseer as reën en/of presipiteer as mis en dou sodra dit oor die plato in beweeg. Die mis en dou wat op die wyse inkom saam met die ooste wind is krities belangrik en voorkom bestuiwings probleme veral gedurende mid-somer droogtes.

Turbulensie van roterende turbine rotors verhoog vertikale vermenging van hitte en water damp wat meteorologiese kondisies windaf nadelig beinvloed, ingesluit reënval

Wind turbines veroorsaak verder aansienlike uitdroging van grond deur dit die warmer bolug af grond toe trek om sodoende grond temperature te verhoog.

Turbines verander dus lokale wind patrone wat negatiewe impak op reenval, grondvog en selfs mikro klimaat het met lang termyn gevolge op vrugbaarheid en produktiviteit van landbou grond en grasvelde.

DIE PLASING VAN DIE WINDTURBINES AAN DIE ONDERKANT VAN DIE PLATORAND SAL DUS FATAAL WEES VIR DIE OMGEWING SE KLIMAAT EN PLANTEGROEI WAT OOK MY BOERDERY VOORUITSIGTE OP DIE LANGTERMYN NADELIG SAL BEINVLOED.

2. VOËL LEWE WORD BEDREIG

Area bestaan uit unieke grasveld wat ideale habitat vir verskeie skaars en bedreigde voël spesies bied. Dit huisves ook groot verkeidenheid klein grasveld spesies wat nie eers hier genoem word nie.

Aantal verskeie bedreigde en / of beskermde spesies wat hier voorkom sluit in :

- **Breekop arende.** Broei paar het vanjaar kuiken suksesvol uitgebroei.
- **Sekretaris voëls.** Verskeie ou sowel as aktiewe neste kom in in die gebied. So onlangs as Mei '24 is 'n paar met kuiken by Waaihoek opgemerk.
- **Mahem** kom verspreid oor hele gebied voor wat ook aktief broei. 'n Kuiken word gereeld saam met volwasenes opgemerk.
- **Blou Kraanvoëls** is aan die toeneem met tenminste een kuiken wat jaarliks waargeneem is.
- **Visarende** besoek ook gereeld die damme in die gebied.
- **Veldpou** kom voor maar raak tans skaars. Neste in die veld is ook al opgemerk.
- **Kalkoen Ibus** is algemeen met verskeie aktiewe broei kolonies.
- Daar is positiewe tekens dat **Aasvoels** ook na die terug beweeg. Broei kolonies is by Smithfield, nie ver van die area, se kranse aktief.

- Verskeie **uil** spesie wat miskien nie bedryg is nie maar uitters noodsaaklik is om ekologiese balans te verseker is ook in groot getalle teenwoordig

Al die voëlspesies, asook vlermuise en insekte, is noodsaaklik om balans in die ekologie te behou en staar gevaar om of gedood of te verskuif na ander gebiede a.g.v.

- Noodlottige botsing met turbine lemme
- Habitat versteurings deur verhoogte grond temperature.
- Lugdruk veranderinge voor turbines asook die werwels agter turbines.
- Baie gevoelig vir lae frekwensie elektromagnetiese druk golwe deur windturbines veroorsaak wat nadelig op hul inwerk
- Uitwis van neste en selfs doodskiet daarvan om goedkeuring hindernisse te elimineer soos reeds bewys is met die skiet van 'n breekop arend.

3. DIERELEWE WORD BEDREIG

Die volgende skaars en beskermde soog diere word o.a. hier aangetref

- Oorbietjie
- Bruinhiëna
- Miershoop tier
- Aardwolf

Die diere staan gevaar om weg te beweeg deur habitat vernietiging, vibrasie en geraas deur turbines veroorsaak. Vuil elektriseteit deur windkrag geproduseer kan deur kabels en in die grond beweeg. Die grond stroom het nadelige effek op die produktiwiteit en voortplanting van soogdiere.

4. GERAAS EN VIRTUELE BESOEDELING

Wind turbines produseer klankgolwe (drukgolwe) deur die roterende lemme en word gehoor as gedruis en / of waarneembaar as infraklanke asook elektromagnetiese golwe wat gegenereer word by omskakeling van wind energie na elektrisiteit. Die omskakeling produseer swak kwaliteit krag (dirty electricity and ground current) wat nadelig op gesondheid van mens en dier is. Die skadu flikkering van turbines is ook bydraende faktor tot gesondheids probleme.

Daar is 'n besliste verband tussen die 'ground current' deur turbines geproduseer en kanker. Dit is al gedokumenteer dat leukemia by kinders met 300% toegeneem het a.g.v. daarvan.

Bogemelde kan egter nog verskeie ander kliniese gesondheids toestande by die mens aktiveer.

By diere en insekte wat lae frekwensie geluide en vibrasies beter as mens waarneem bestaan groot gevaar dat as gevolg daarvan om uit gebied te beweeg en sodoende heeltemal te verdwyn.

IN DIE LIG VAN DIE FEITE MOET 'N TURBINE EN KABEL VRYE BUFFERSONE VAN MINSTENS 1,5KM VANAF MY EIENDOM SE GRENSDRADE GEHANHAAF WORD.

Die aantal hoe turbines dra by tot virtuele besoedeling van die natuur.

5. INFRASTRUKTUUR

Die verbeterde infrastruktuur sal lei tot toename in beweging en invloei van ongewenste elemente wat misdaad drasties sal verhoog. Veediefstal by my boerdery het gestop sedert ek opgehou het om distrikpad na Sheepmoor te skraap omdat dit moeilik begaanbaar geword het.

Gedurende die konstruksie fase kan arbeids onrus verwag word a.g.v. verwagtinge wat by lokale bevolking geskep word.

Die feit dat geen turbines op my eiendom toegelaat word nie gaan my eiendom nie vrywaar van die negatiewe newe effekte van die 3 windplase nie.

DEEGLIKE VERDERE ONDERSOEKE WORD DUS VERSOEK ALVORENS GOEDKEURING DEUR DIE OWERHEID AAN PROJEK VERLEEN WORD

- **LANGTERMYN INVLOED VAN BEPLANDE WINDPLASE OP LANDBOU, KLIMAAT EN REENVAL.**

- **IDENTIFISEERING EN BEWEGINGS VAN BEDREIGDE EN BESKERMDE VOËLSPESIE ASOOK WAAR NESTE VOORKOM, AKTIEWE EN OU NESTE.**

- **IDENTIFISERING VAN DIE SKAARS SOOGDIERE ASOOK HUL BEWEGINGS IN DIE GERBIED.**

Voorsien nadelige langtermyn vooruitsigte vir die landbou en omgewing en kan dus ontwikkeling van windplase nie ONVOORWAARLIK steun nie.

Die uwe

PER E-MAIL

Dear Ms Gopaul

COMMENTS ON THE DRAFT SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The Application for Environmental Authorisation and Draft Scoping Report (SR) dated August 2024 and received by the Department on 22 August 2024, refer.

This letter serves to inform you that the following information must be included to the Final Scoping Report:

Application form

1. Please confirm that the postal code for the EAP's address is correct.
2. The screening tool report attached as Appendix 14 of the application form must be signed by the compiler.
3. Please ensure that all relevant listed activities are applied for, are specific and that it can be linked to the development activity or infrastructure as described in the project description. The onus is on the applicant and the environmental assessment practitioner (EAP) to ensure that all the applicable

The processing of personal information by the Department of Forestry, Fisheries and the Environment is done lawfully and not excessive to the purpose of processing in compliance with the POPI Act, any codes of conduct issued by the Information Regulator in terms of the POPI Act and / or relevant legislation providing appropriate security safeguards for the processing of personal information of others.

listed activities are included in the application form. Failure to do so may result in unnecessary delays in the processing of the application.

4. If the activities applied for in the application form differ from those mentioned in the final SR, an amended application form must be submitted with the final SR.
5. Please take note of GNR 4143, which was gazetted on the 04 December 2023, which requires a letter of consent from Eskom Holdings SOC Ltd if the proposed development is within a specific radius of a main electricity transmission or distribution substation. Should this gazette apply to the proposed development, please ensure the necessary documents are included.

Specialist Assessments

6. Page 4 of the meeting minutes of the pre-application meeting held on 26 April 2023 refers to the applicant undertaking a Geotechnical Assessment; however, this study is not included in the Specialist Plan of Study (PoS). All required specialist studies must be conducted as part of the EIA process. If there are development design constraints, a desktop Geotechnical Assessment must be included as part of the Specialist PoS.
7. The Civil Aviation Theme has a "Medium sensitivity" rating, as per the outcome of the screening tool provided. According to the protocols, a Civil Aviation Compliance Statement must be included in the PoS. Should a compliance statement not be included as part of the PoS, a motivation/explanation for its exclusion, must be provided [including proof of request for comments from the Air Traffic and Navigation Services (ATNS)].
8. You are requested to submit copies of signed Specialist Declaration of Interest forms (witnessed and signed by a Commissioner of Oaths) for all specialist studies conducted. The forms are available on Department's website (please use the Department template).
9. Please note that in terms of Government Notice No. 320 of 20 March 2020 (i.e. "the Protocols"), and Government Notice No. 1150 of 30 October 2020 (i.e. protocols for terrestrial plant and animal species), it is a requirement for specialists to be registered with the South African Council for Natural Scientific Professions (SACNASP) in their respective fields.
10. The Heritage Survey, which has been included as part of this SR, must be submitted to the South African Heritage Resources Agency (SAHRA) for comments, via the South African Heritage Resources Information System (SAHRIS).

Public Participation Process

11. The Public Participation Process must be conducted in terms of Regulation 39, 40 41, 42, 43 & 44 of the EIA Regulations 2014, as amended.
12. The proposed development site is within a Critical Biodiversity Area (CBA) and National Protected Areas Expansion Strategy (NPAES). Comments must be obtained from this Department's Biodiversity Conservation Section. The contact details are as follows:
    i. Biodiversity Conservation Directorate
    Attention: Mr. Seoka Lekota
    Email: BCAdmin@dffe.gov.za
    ii. Protected Areas Planning and Management Effectiveness Directorate
    Attention: Mr. Thivhulawi Nethononda
    Email: TNethononda@dffe.gov.za
13. Please ensure that all issues raised and comments received during the circulation of the draft SR from registered Interested and Affected Parties (I&APs) and organs of state which have jurisdiction in respect of the proposed activity are adequately addressed and included in the final SR.

14. Copies of original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity are submitted to the Department with the final SR.
15. Proof of correspondence with the various stakeholders must be included in the final SR. This must indicate that this draft SR has been subjected to 30 days public participation process, stating the start and end date of the PPP. Should you be unable to obtain comments, proof must be submitted to the Department of the attempts that were made to obtain comments.
16. All issues raised and comments received during the circulation of the draft SR from I&APs and organs of state which have jurisdiction in respect of the proposed activity are adequately addressed in the final SR, including comments from this Department, and must be incorporated into the Comments and Response Report (CRR).
17. The CRR report must be a separate document from the main report and the format must be in the table format as indicated in *Annexure 1* of this comments letter.
18. Comments from I&APs must not be split and arranged into categories. Comments from each submission must be responded to individually.
19. Please refrain from summarising comments made by I&APs. All comments from I&APs must be copied *verbatim* and responded to clearly. Please note that a response such as "noted" is not regarded as an adequate response to an I&AP's comments.
20. The attendance register and minutes of any meetings held by the Environmental Assessment Practitioner (EAP) with Interested and Affected Parties (I&APs) and other role players must be included in the final SR.
21. Provide photo evidence of on-site notices, including the names of landmarks and/or GPS coordinates (in degrees, minutes, and seconds) of their placements.
22. Please submit a full page of the newspaper(s) containing the advertisement, ensuring that the information in the advert is legible and that the name of the newspaper and date are visible.

General

You are further reminded to comply with Regulation 21(1) of the NEMA EIA Regulations 2014, as amended, which states that:

"If S&EIR must be applied to an application, the applicant must, within 44 days of receipt of the application by the competent authority, submit to the competent authority a scoping report which has been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received, including any comments of the competent authority"

You are are further reminded that the final SR to be submitted to this Department must comply with all the requirements in terms of the scope of assessment and content of Scoping reports in accordance with Appendix 2 and Regulation 21(1) of the EIA Regulations 2014, as amended.

Further note that in terms of Regulation 45 of the EIA Regulations 2014, as amended, this application will lapse if the applicant fails to meet any of the timeframes prescribed in terms of these Regulations, unless an extension has been granted in terms of Regulation 3(7).

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Yours sincerely

Dr Sabelo Malaza

PER E-MAIL

Dear Ms Gopaul

COMMENTS ON THE DRAFT SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE ROCHDALE WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The Application for Environmental Authorisation and Draft Scoping Report (SR) dated August 2024 and received by the Department on 22 August 2024, refer.

This letter serves to inform you that the following information must be included to the Final Scoping Report:

Application form

1. Please confirm that the postal code for the EAP's address is correct.
2. The screening tool report attached as Appendix 14 of the application form must be signed by the compiler.
3. Please ensure that all relevant listed activities are applied for, are specific and that it can be linked to the development activity or infrastructure as described in the project description. The onus is on the applicant and the environmental assessment practitioner (EAP) to ensure that all the applicable

The processing of personal information by the Department of Forestry, Fisheries and the Environment is done lawfully and not excessive to the purpose of processing in compliance with the POPI Act, any codes of conduct issued by the Information Regulator in terms of the POPI Act and / or relevant legislation providing appropriate security safeguards for the processing of personal information of others.

listed activities are included in the application form. Failure to do so may result in unnecessary delays in the processing of the application.

4. If the activities applied for in the application form differ from those mentioned in the final SR, an amended application form must be submitted with the final SR.
5. Please take note of GNR 4143, which was gazetted on the 04 December 2023, which requires a letter of consent from Eskom Holdings SOC Ltd if the proposed development is within a specific radius of a main electricity transmission or distribution substation. Should this gazette apply to the proposed development, please ensure the necessary documents are included.

Specialist Assessments

6. Page 4 of the meeting minutes of the pre-application meeting held on 26 April 2023 refers to the applicant undertaking a Geotechnical Assessment; however, this study is not included in the Specialist Plan of Study (PoS). All required specialist studies must be conducted as part of the EIA process. If there are development design constraints, a desktop Geotechnical Assessment must be included as part of the Specialist PoS.
7. The Civil Aviation Theme has a "Medium sensitivity" rating, as per the outcome of the screening tool provided. According to the protocols, a Civil Aviation Compliance Statement must be included in the PoS. Should a compliance statement not be included as part of the PoS, a motivation/explanation for its exclusion, must be provided [including proof of request for comments from the Air Traffic and Navigation Services (ATNS)].
8. You are requested to submit copies of signed Specialist Declaration of Interest forms (witnessed and signed by a Commissioner of Oaths) for all specialist studies conducted. The forms are available on Department's website (please use the Department template).
9. Please note that in terms of Government Notice No. 320 of 20 March 2020 (i.e. "the Protocols"), and Government Notice No. 1150 of 30 October 2020 (i.e. protocols for terrestrial plant and animal species), it is a requirement for specialists to be registered with the South African Council for Natural Scientific Professions (SACNASP) in their respective fields.
10. The Heritage Survey, which has been included as part of this SR, must be submitted to the South African Heritage Resources Agency (SAHRA) for comments, via the South African Heritage Resources Information System (SAHRIS).

Public Participation Process

11. The Public Participation Process must be conducted in terms of Regulation 39, 40 41, 42, 43 & 44 of the EIA Regulations 2014, as amended.
12. The proposed development site is within a Critical Biodiversity Area (CBA) and National Protected Areas Expansion Strategy (NPAES). Comments must be obtained from this Department's Biodiversity Conservation Section. The contact details are as follows:
    i. Biodiversity Conservation Directorate
    Attention: Mr. Seoka Lekota
    Email: BCAdmin@dffe.gov.za
    ii. Protected Areas Planning and Management Effectiveness Directorate
    Attention: Mr. Thivhulawi Nethononda
    Email: TNethononda@dffe.gov.za
13. Please ensure that all issues raised and comments received during the circulation of the draft SR from registered Interested and Affected Parties (I&APs) and organs of state which have jurisdiction in respect of the proposed activity are adequately addressed and included in the final SR.

14. Copies of original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity are submitted to the Department with the final SR.
15. Proof of correspondence with the various stakeholders must be included in the final SR. This must indicate that this draft SR has been subjected to 30 days public participation process, stating the start and end date of the PPP. Should you be unable to obtain comments, proof must be submitted to the Department of the attempts that were made to obtain comments.
16. All issues raised and comments received during the circulation of the draft SR from I&APs and organs of state which have jurisdiction in respect of the proposed activity are adequately addressed in the final SR, including comments from this Department, and must be incorporated into the Comments and Response Report (CRR).
17. The CRR report must be a separate document from the main report and the format must be in the table format as indicated in *Annexure 1* of this comments letter.
18. Comments from I&APs must not be split and arranged into categories. Comments from each submission must be responded to individually.
19. Please refrain from summarising comments made by I&APs. All comments from I&APs must be copied *verbatim* and responded to clearly. Please note that a response such as "noted" is not regarded as an adequate response to an I&AP's comments.
20. The attendance register and minutes of any meetings held by the Environmental Assessment Practitioner (EAP) with Interested and Affected Parties (I&APs) and other role players must be included in the final SR.
21. Provide photo evidence of on-site notices, including the names of landmarks and/or GPS coordinates (in degrees, minutes, and seconds) of their placements.
22. Please submit a full page of the newspaper(s) containing the advertisement, ensuring that the information in the advert is legible and that the name of the newspaper and date are visible.

General

You are further reminded to comply with Regulation 21(1) of the NEMA EIA Regulations 2014, as amended, which states that:

"If S&EIR must be applied to an application, the applicant must, within 44 days of receipt of the application by the competent authority, submit to the competent authority a scoping report which has been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received, including any comments of the competent authority"

You are are further reminded that the final SR to be submitted to this Department must comply with all the requirements in terms of the scope of assessment and content of Scoping reports in accordance with Appendix 2 and Regulation 21(1) of the EIA Regulations 2014, as amended.

Further note that in terms of Regulation 45 of the EIA Regulations 2014, as amended, this application will lapse if the applicant fails to meet any of the timeframes prescribed in terms of these Regulations, unless an extension has been granted in terms of Regulation 3(7).

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Yours sincerely

Dr Sabelo Malaza

PER E-MAIL

Dear Ms Gopaul

COMMENTS ON THE DRAFT SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The Application for Environmental Authorisation and Draft Scoping Report (SR) dated August 2024 and received by the Department on 22 August 2024, refer.

This letter serves to inform you that the following information must be included to the Final Scoping Report:

Application form

1. Please confirm that the postal code for the EAP's address is correct.
2. The screening tool report attached as Appendix 14 of the application form must be signed by the compiler.
3. Please ensure that all relevant listed activities are applied for, are specific and that it can be linked to the development activity or infrastructure as described in the project description. The onus is on the applicant and the environmental assessment practitioner (EAP) to ensure that all the applicable

The processing of personal information by the Department of Forestry, Fisheries and the Environment is done lawfully and not excessive to the purpose of processing in compliance with the POPI Act, any codes of conduct issued by the Information Regulator in terms of the POPI Act and / or relevant legislation providing appropriate security safeguards for the processing of personal information of others.

listed activities are included in the application form. Failure to do so may result in unnecessary delays in the processing of the application.

4. If the activities applied for in the application form differ from those mentioned in the final SR, an amended application form must be submitted with the final SR.
5. Please take note of GNR 4143, which was gazetted on the 04 December 2023, which requires a letter of consent from Eskom Holdings SOC Ltd if the proposed development is within a specific radius of a main electricity transmission or distribution substation. Should this gazette apply to the proposed development, please ensure the necessary documents are included.

Specialist Assessments

6. Page 4 of the meeting minutes of the pre-application meeting held on 26 April 2023 refers to the applicant undertaking a Geotechnical Assessment; however, this study is not included in the Specialist Plan of Study (PoS). All required specialist studies must be conducted as part of the EIA process. If there are development design constraints, a desktop Geotechnical Assessment must be included as part of the Specialist PoS.
7. The Civil Aviation Theme has a "Medium sensitivity" rating, as per the outcome of the screening tool provided. According to the protocols, a Civil Aviation Compliance Statement must be included in the PoS. Should a compliance statement not be included as part of the PoS, a motivation/explanation for its exclusion, must be provided [including proof of request for comments from the Air Traffic and Navigation Services (ATNS)].
8. You are requested to submit copies of signed Specialist Declaration of Interest forms (witnessed and signed by a Commissioner of Oaths) for all specialist studies conducted. The forms are available on Department's website (please use the Department template).
9. Please note that in terms of Government Notice No. 320 of 20 March 2020 (i.e. "the Protocols"), and Government Notice No. 1150 of 30 October 2020 (i.e. protocols for terrestrial plant and animal species), it is a requirement for specialists to be registered with the South African Council for Natural Scientific Professions (SACNASP) in their respective fields.
10. The Heritage Survey, which has been included as part of this SR, must be submitted to the South African Heritage Resources Agency (SAHRA) for comments, via the South African Heritage Resources Information System (SAHRIS).

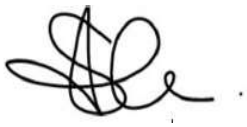
Public Participation Process

11. The Public Participation Process must be conducted in terms of Regulation 39, 40 41, 42, 43 & 44 of the EIA Regulations 2014, as amended.
12. The proposed development site is within a Critical Biodiversity Area (CBA) and National Protected Areas Expansion Strategy (NPAES). Comments must be obtained from this Department's Biodiversity Conservation Section. The contact details are as follows:
    i. Biodiversity Conservation Directorate
    Attention: Mr. Seoka Lekota
    Email: BCAdmin@dffe.gov.za
    ii. Protected Areas Planning and Management Effectiveness Directorate
    Attention: Mr. Thivhulawi Nethononda
    Email: TNethononda@dffe.gov.za
13. Please ensure that all issues raised and comments received during the circulation of the draft SR from registered Interested and Affected Parties (I&APs) and organs of state which have jurisdiction in respect of the proposed activity are adequately addressed and included in the final SR.

14. Copies of original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity are submitted to the Department with the final SR.
15. Proof of correspondence with the various stakeholders must be included in the final SR. This must indicate that this draft SR has been subjected to 30 days public participation process, stating the start and end date of the PPP. Should you be unable to obtain comments, proof must be submitted to the Department of the attempts that were made to obtain comments.
16. All issues raised and comments received during the circulation of the draft SR from I&APs and organs of state which have jurisdiction in respect of the proposed activity are adequately addressed in the final SR, including comments from this Department, and must be incorporated into the Comments and Response Report (CRR).
17. The CRR report must be a separate document from the main report and the format must be in the table format as indicated in *Annexure 1* of this comments letter.
18. Comments from I&APs must not be split and arranged into categories. Comments from each submission must be responded to individually.
19. Please refrain from summarising comments made by I&APs. All comments from I&APs must be copied *verbatim* and responded to clearly. Please note that a response such as "noted" is not regarded as an adequate response to an I&AP's comments.
20. The attendance register and minutes of any meetings held by the Environmental Assessment Practitioner (EAP) with Interested and Affected Parties (I&APs) and other role players must be included in the final SR.
21. Provide photo evidence of on-site notices, including the names of landmarks and/or GPS coordinates (in degrees, minutes, and seconds) of their placements.
22. Please submit a full page of the newspaper(s) containing the advertisement, ensuring that the information in the advert is legible and that the name of the newspaper and date are visible.

General

You are further reminded to comply with Regulation 21(1) of the NEMA EIA Regulations 2014, as amended, which states that:



"If S&EIR must be applied to an application, the applicant must, within 44 days of receipt of the application by the competent authority, submit to the competent authority a scoping report which has been subjected to a public participation process of at least 30 days and which reflects the incorporation of comments received, including any comments of the competent authority"

You are are further reminded that the final SR to be submitted to this Department must comply with all the requirements in terms of the scope of assessment and content of Scoping reports in accordance with Appendix 2 and Regulation 21(1) of the EIA Regulations 2014, as amended.

Further note that in terms of Regulation 45 of the EIA Regulations 2014, as amended, this application will lapse if the applicant fails to meet any of the timeframes prescribed in terms of these Regulations, unless an extension has been granted in terms of Regulation 3(7).

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Yours sincerely

Good morning

Regarding your enquiry below, the following:

- The comments for the Emvelo project (our ref: LUA 24/3966) is currently at the Acting Manager: Scientific Service for review). The signed copy might be released today, which will be send to you as soon as I receive it.

- The commenting scientist is currently still busy commenting on the Rochdale project (LUA 24/3965).

Kind regards

Celia

Email: ERM.ArcusAmsterdam@erm.com

Dear Ms., Gopaul

SUBJECT: THE MTPA COMMENTS ON THE DRAFT ENVIRONMENTAL SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY (WEF) (23 WIND TURBINES) AND AUXILIARY INFRASTRUCTURE (1 ON-SITE SUBSTATION WITH A CAPACITY OF 132Kv, AND 1 OVER-HEAD POWERLINE OF APPROXIMATELY 22.3 KM) ON SEVERAL PORTIONS OF FARMS COVERING AN AREA OF 5 918 HA EAST OF ERMELO FOR SHEEPMOOR WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE NUMBER TO BE PROVIDED.

With reference to your correspondence reference **Project no: 0684401** of August 2024, herewith the MTPA comments.

The application has been assessed by using the following tools: Mpumalanga Biodiversity Sector Plan (2014 as updated 2022) land use guidelines, the DFFE web-based sensitivity screening tool, Environmental legislation NEMA and EIA regulations 2014 as amended, Department of Water and Sanitation and Water Research Commission Guidelines on wetlands, the South African Heritage Resources Act and knowledge to assess Development Applications.

The sensitivity of the area, in which the prospecting activity is proposed and is likely to occur was assessed according to the Mpumalanga Biodiversity Sector plan (MBSP; MTPA, 2014). The sensitivity is assessed in terms of terrestrial and freshwater assessments. In the MBSP, sensitivity areas are identified in terms of *Critical Biodiversity Areas* (CBAs) and *Ecological Support Areas* (ESAs). CBAs and ESAs are deemed to be

necessary to ensure the protection of biodiversity, environmental sustainability and sustainable living and are to remain unaltered.

Comments with regards to the terms of reference for studies needed:

With reference to the assessment of your Draft Scoping Report the MTPA is concerned about the following issues raised with regards to the terms of reference for specialist studies to be done.

1. The alternative sites, although less sensitive to the preferred site, are still located in sensitive areas.
2. Ground truthing and on-site studying of areas regarded as degraded or sensitive and suitable for potential wind turbines must be done considering that cultivated/vegetated lands might be feeding areas for many Species of Conservation Concern. The Site sensitivity verification report must include the feeding areas for SCC.
3. The avoidance of large areas of critical biodiversity terrestrial and freshwater sensitivity areas and the preliminary project layout overlain area is a large concern especially in the southeastern part of the study area.
4. The threat of this WEF to the Important Bird Area and the status of globally threatened bird species such as the Southern Bald Ibis and Secretary bird is of concern. The onsite avifaunal study must include local knowledge of the distribution of large birds especially the Blue crane that is a local migrant during the wintertime.
5. Included in the MTPA's comments are the following discussion that illustrates the **need and desirability** of this proposal:

Renewable energy applications

- Given the energy needs of the country, significant emphasis is being placed on the need to transition away from coal towards renewable energy. However, the urgency and desire to approve nearly all renewable energy applications needs to be put into perspective considering the incredible investment and proliferation of new renewable energy projects within Mpumalanga.
- The MTPA and DARDLEA are maintaining a database of renewable energy projects, which include those in the pre-application phase. We can confirm that 61 renewable energy projects have now been submitted within Mpumalanga. Just over 50% of these have been approved to date. 18 of these are for Wind Energy Farms, which together make up for over 233 000 ha, and this amount is growing as the province is being inundated with renewable energy applications.
- The explosion of renewable energy applications does require careful consideration as to the likely impacts. There is no shortage of renewable energy projects within the Province and the Province has room to apply its mind and navigate this space carefully. The province has now over 300 000 ha of renewable energy applications, and the many more than are still to be submitted.

Mpumalanga Biodiversity Sector Plan (MBSP), Intact Grassland Patches and Important Bird Areas (IBAs)

- The project **footprint overlaps with a significant amount of Critical Biodiversity Areas** (CBA). 1 488.9 ha (over 28%) of the footprint area is identified as a CBA. Wind farms are not appropriate land uses within CBA areas. Two proposed wind turbines are placed in CBA Irreplaceable areas.
- The MBSP Terrestrial assessment indicates that the project footprint is within CBA: Irreplaceable, CBA: Optimal, ESA: Local Corridor, ESA: Landscape Corridor, ESA: Species Specific, Other Natural Areas, Moderately Modified, and Heavily Modified Areas.
- The MBSP Freshwater Assessment indicates that the project footprint is within ESA: Strategic Water Source Areas, and has CBA: Aquatic River, ESA: Wetland Clusters, ESA: Wetlands, ESA: Important Sub-catchments, Other Natural and Heavily Modified Areas.
- ESA: Strategic Water Source Area (SWSAs) maintain ecological integrity across the entire sub-catchment, paying particular attention to maintaining water quality, water quantity, and habitat integrity. They represent 10% of the surface area producing approximately 50% of Mpumalanga's water. The proposed WEF activity in the area might compromise the quality and quantity of the surface water resources through siltation.
- The whole of the proposed Sheepmoor wind farm falls within an Important Bird Area (IBA), which underscores the need to consider its implications on metapopulation dynamics and the need to avoid wind farms in "source" areas.
- The project area mainly falls within the Mesic Eastern Highveld Grassland (Endangered). A high proportion of this vegetation type is threatened and is generally poorly protected. Hence, it should be carefully managed for the persistence of biodiversity; large areas of natural habitat are needed for many bird species, plants, and numerous wetlands that the Mesic Highveld Grassland supports.
- The proposed project area has a portion of Wakkerstroom Montane Grassland (Least Concern). A variety of land-uses are supported by this area and the conservation and good management of this area depends on the continued land-uses practices that have been able to support this biodiversity. The importance of sustainable development is crucial to the long-term maintenance of the biodiversity and ecosystem services in this area.
- 2 143.6 ha (36 %) of the proposed wind farm is comprised of intact grassland patches. With only 51% of the grasslands remaining in a natural state, very little intact natural grasslands still occur in Mpumalanga. Three proposed wind turbines are placed in intact grassland patches.
- Intact grassland patches are areas larger than 100ha, with little or no gaps or edge effects. They were then prioritised according to their connectivity importance. These intact grasslands are "source" areas for avifaunal species where birth rates are expected to exceed death rates, and no wind farms should be placed anywhere near these intact grassland patches.
- The identification of actual avifaunal source areas may be difficult, but as these intact grassland patches occur within an Important Bird Area (IBA) where there are several nesting and roosting avifaunal species of conservation concern, it highlights their significance and our confidence in confirming these as "source" areas. The presence of these intact grassland patches, CBAs, and the IBAs, is probably the biggest concern that the MTPA may have about the proposed wind farm.

- 84 % of the proposed study area is Important Bird Area and 9.3% of the proposed study area is a Key Biodiversity Area.
- Wind farms are not to be placed in IBAs or intact grassland areas as these are important areas where avifauna should be allowed to thrive and then disperse to other areas.
- Approval of the project in such a location could have far-reaching consequences for threatened bird species, potentially disrupting vital source areas critical for population sustainability.
- The south of the project area falls within the National Protected Areas Expansion Strategy (NPAES) Focus Area (Moist Escarpment Grasslands). The Chrissiesmeer Protected Environment overlaps the north of the project area and Jericho Dam Nature Reserve overlaps the eastern part of the project area.
- It is imperative to adopt a precautionary approach and prioritize the conservation of these essential habitats.

Avifaunal concerns

- **Thirteen out of the 23 proposed wind turbines are placed within the 5 km buffer of a Martial Eagles' recommended buffer these should be removed.**
- 26% of the proposed wind turbines are not covered by vantage points.
- The presence of priority bird species for wind energy developments were recorded within the footprint area.
- Two Southern Bald Ibis colonies (Vulnerable) occur within footprint area.
- A Secretary bird nest (Endangered) was found within this area.
- Birds are very mobile and with the proposed turbine height and blade lengths, the current proposed buffers seem inadequate.
- This raises particular concern as these birds may continuously collide with the blades of the wind turbines and the continuous loss of several of these long-lived birds every year may have a significant impact on population status.
- The artificial water bodies within the footprint area may be important for flamingos and other water-dependent birds.

Site Sensitivity Verification

- The results of the Site Sensitivity Verification confirmed that:
    - The sensitivity for the Terrestrial biodiversity impact assessment as Very High in grassland and wetland habitat.
    - Aquatic Biodiversity Impact Assessment as Very High Sensitivity
    - Plant Species Assessment as Medium Sensitivity
    - Animal Species Assessment as High Sensitivity
    - Bat Assessment Very High/High Sensitivity
    - Avifaunal Assessment as Very High/High Sensitivity.

Additional concerns

- Not all the infrastructure has been included on the map or addressed in terms of likely impact, in this case, roads.

Recommendations:

- There should be a thorough Oribi census plan in place, and it should be included in the final EIA report as the project area is home to many Oribi antelope. (Red data species dependant on healthy highveld grasslands).
- Species 23 must be accounted for, and a management plan drawn up for it since the project area is a potential site for its occurrence.
- The EWT's recommended 5 km buffer for the Martial Eagle's nest is non-negotiable and should be adhered to throughout the project lifecycle.
- The current identified Avifaunal Sensitivities map of all 'no-go' areas (Figure (I)) indicates little area for available for the wind farm. With more appropriate buffers, more field work, and all the associated infrastructure (such as roads), we cannot see how it would be possible to establish a wind farm within the footprint area.
- Increase buffer zones for endangered bird nesting sites to reflect their wider flight ranges relative to the height of the turbines.
- Consider alternative locations with less ecological sensitivity, especially considering the numerous renewable energy projects already approved in Mpumalanga.

Conclusion:

The proposed Sheepmoor Wind Energy Facility poses a significant threat to a Critical Biodiversity Areas, intact grassland patches, Important Bird areas, and the habitat of numerous threatened bird species. Relying on the information presented to date, and the desktop assessments, **it is in the MTPA's opinion that this project is fatally flawed.** The anticipated impacts on biodiversity, particularly the avifauna, is too great to support this project. More ecological assessments and exploration of alternative locations are crucial before proceeding with this project.

Please do not hesitate to contact this office if there are any inquiries.

Dear Ms., Gopaul

SUBJECT: MTPA'S COMMENTS REGARDING THE DRAFT SCOPING FOR THE 45 WIND TURBINES EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE,) AND AUXILIARY INFRASTRUCTURE (1 ON-SITE SUBSTATION WITH A CAPACITY OF 200MW, AND 1 OVER-HEAD 132 kV POWERLINE OF APPROXIMATELY 30 KM) ON 18 PORTIONS OF FARMS COVERING AN AREA OF 6 964 HA EAST OF ERMELO FOR EMVELO WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE NUMBER TO BE PROVIDED. MPUMALANGA PROVINCE.

Your correspondence with the project ref no. 0684401 of date 28/08/2024.

COMMENTS AND CONCERNS:

The sensitivity of the above farm on which the proposed activity is likely to occur was assessed according to the Mpumalanga Biodiversity Sector Plan (MBSP; MTPA, 2014). This sensitivity is assessed in terms of terrestrial and freshwater assessments. In the MBSP, priority sensitive areas are identified in terms of Critical Biodiversity Areas (CBAs) and Ecological Support Areas (ESAs). CBAs and ESAs are deemed to be necessary to ensure protection of biodiversity, environmental sustainability, and human well-being, and are to remain unaltered.

According to the MBSP terrestrial assessment map (figure 1) the proposed development will occur within CBA Irreplaceable, CBA Optimal, ESA Landscape corridor, ESA Ecological Corridor, Important Bird Areas (IBA), other natural areas, moderately modified- old lands and heavily modified area (Degraded). According to the freshwater assessments map (figure 2), the proposed development will occur within a CBA Aquatic River, CBA wetlands, ESA wetlands, ESA Strategic water source, ESA Important sub-catchments other natural areas and heavily modified area (Degraded).

The MTPA have the following concerns:

The MTPA is concerned with the proposed project area for the Emvelo Wind Energy Facility (WEF) and its associated Auxiliary infrastructure which is within Important Bird Areas (IBA), CBA Irreplaceable, CBA optimal, CBA aquatic rivers, ESA wetland clusters, ESA wetlands and intact grasslands. These areas are of biodiversity importance and the proposed Emvelo WEF and associated infrastructure will compromise the primary biodiversity objectives of these areas.

The MTPA is concerned with a number of turbines that are in no-go areas or highly sensitive areas. There are ten (10) turbines that are located within the intact grasslands which are turbines 1, 2, 3, 4, 5, 6, 7, 9, 13 and 15 (refer to Figure 3), intact grasslands are crucial for supporting threatened avifauna and these turbines will compromise that biodiversity objective. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal.

Turbines 12, 14, 16, 17, 29, 32 and 33 are within CBA irreplaceable, which is to be maintained in a natural state with no loss of ecosystems, functionality or species with no flexibility in land-use options. Turbines 8, 18 and 19 are within CBA optimal which is to be maintained in a natural state with no loss of ecosystems, functionality or species with some flexibility in land-use options.

Turbines 1,2,3,5, 9, 11, 13, 15, 18, 19, 22, 24, 26, 31, and 35 are located within Important Bird Area (IBA). The Important Bird Area (IBA) as established by the Birdlife SA are areas that has the richness of conservation important bird species and care should be taken not to lose their breeding and feeding habitats. Wind turbines increase the risk of bird's collision. Surface water (Wetlands, drainage lines and dams) is crucially important for priority Avifauna, wind turbines and powerlines that that are placed near surface water pose a collision risk (as mentioned by the Avifaunal specialist). The most preferred sites are Moderately and Heavily modified areas; other natural areas are also preferred but under certain conditions.

The proposed Emvelo WEF and its associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered); Martial Eagle (Globally and Regionally Endangered); Denham's Bustard (Globally Near Threatened, Regionally Vulnerable); Secretary bird (Globally Endangered, Regionally Vulnerable); White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened); Grey Crowned Crane (Globally and Regionally Endangered); Lanner Falcon (Regionally Vulnerable); Greater Flamingo (Regionally Near Threatened); Southern Bald Ibis (Regionally and Globally Vulnerable); Cape

Vulture (Globally Vulnerable and Regionally Endangered); and Yellow-breasted Pipit (Regionally and Globally Vulnerable).

Turbines 1, 2, 3, 5, 7, 9, 13 and 15 are within the 5km Martial Eagle Buffer, Birdlife South Africa currently recommends 5-6 km buffer for Martial Eagles, this 5km no-go buffer must be adhered to by the Applicant.

The MTPA would like to recommend the following:

- Key biodiversity areas should be avoided, and Wind turbines removed from such.

- A 100m buffer around wetlands and other waterbodies must be implemented and adhered to throughout the lifecycle of the proposed development.
- 5km radius Martial Eagle Buffer (as recommended by BirdLifeSA) must be implemented and avoided throughout the lifecycle of the proposed development.
- A Thorough Terrestrial Biodiversity assessment which also includes Intact grasslands patches.
- A thorough Avifaunal study must be done with all the best practices to avoid the bird collision risks.
- Proper mitigation strategies of the wind turbines to avoid collisions and mortalities must be included in the EIAr.
- The roads, temporary site camps and all the other associated infrastructure must be included on the site layout of the Emvelo WEF in the EIAr.
- The Applicant must find a more suitable alternative site for this development with less risk to biodiversity.
- The clearance or removal of vegetation must be restricted to the project footprint.
- Moderately modified- old lands and heavily modified areas (Degraded) are the most preferred sites for the Emvelo WEF, other natural areas are also preferred but under certain conditions.
- The applicant must apply duty of care to ensure that there is no significant pollution or degradation of the environment.

The MTPA does not support the Environmental Authorisation of the proposed Emvelo Wind Energy Facility (Pty) Ltd for proposed Wind Energy Facility and Auxiliary infrastructure operation within the application area with up to 45 proposed wind turbines. The sensitive areas cover most of the proposed Emvelo WEF project area, Important Birds Area (IBA) covers 43% of the project area; Key Biodiversity Areas (KBA) Covers 21.4% of the project area; Critical Biodiversity Areas (CBA) covers 1,302.2 ha of the project area; and 2,272.5 ha of intact grassland patches within the project area.

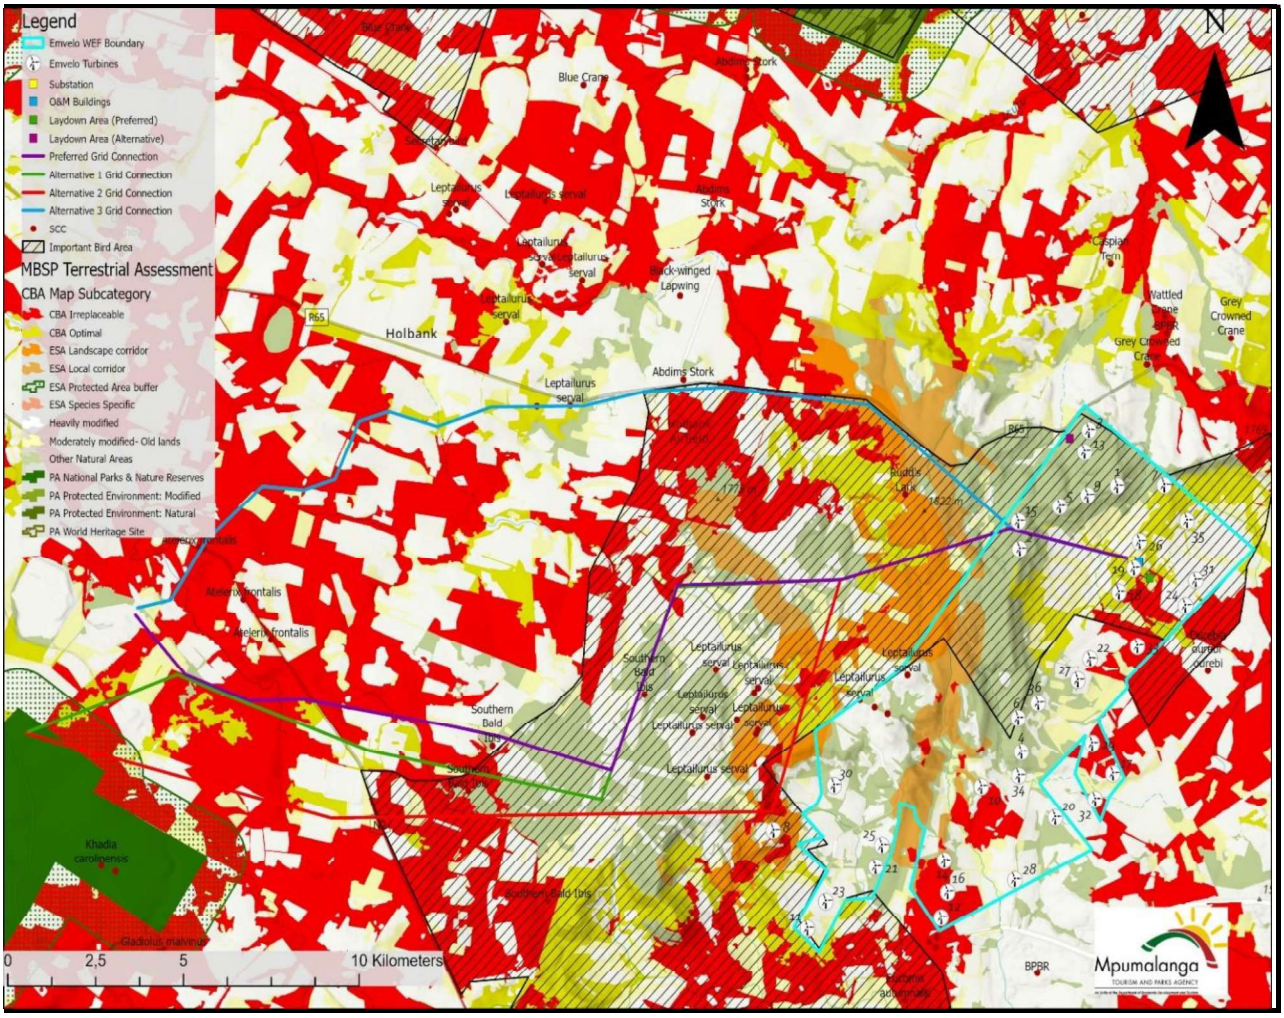

Figure 1. MBSP based terrestrial biodiversity assessment for the Emvelo Wind Energy Facility.

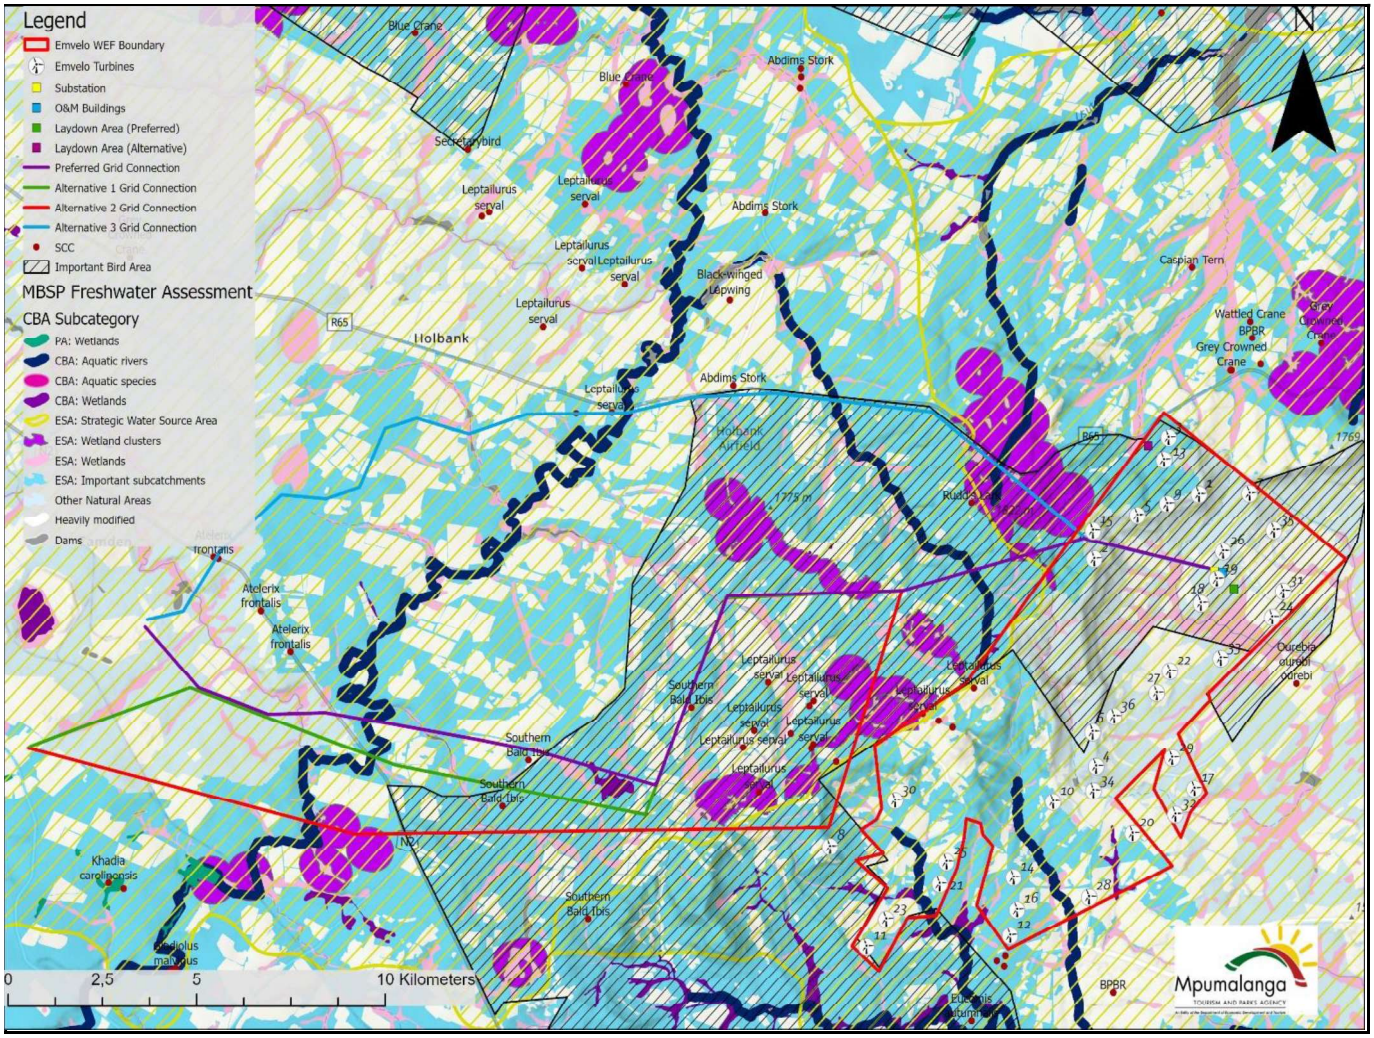

Figure 2. MBSP based Freshwater biodiversity assessment for the Emvelo Wind Energy Facility.

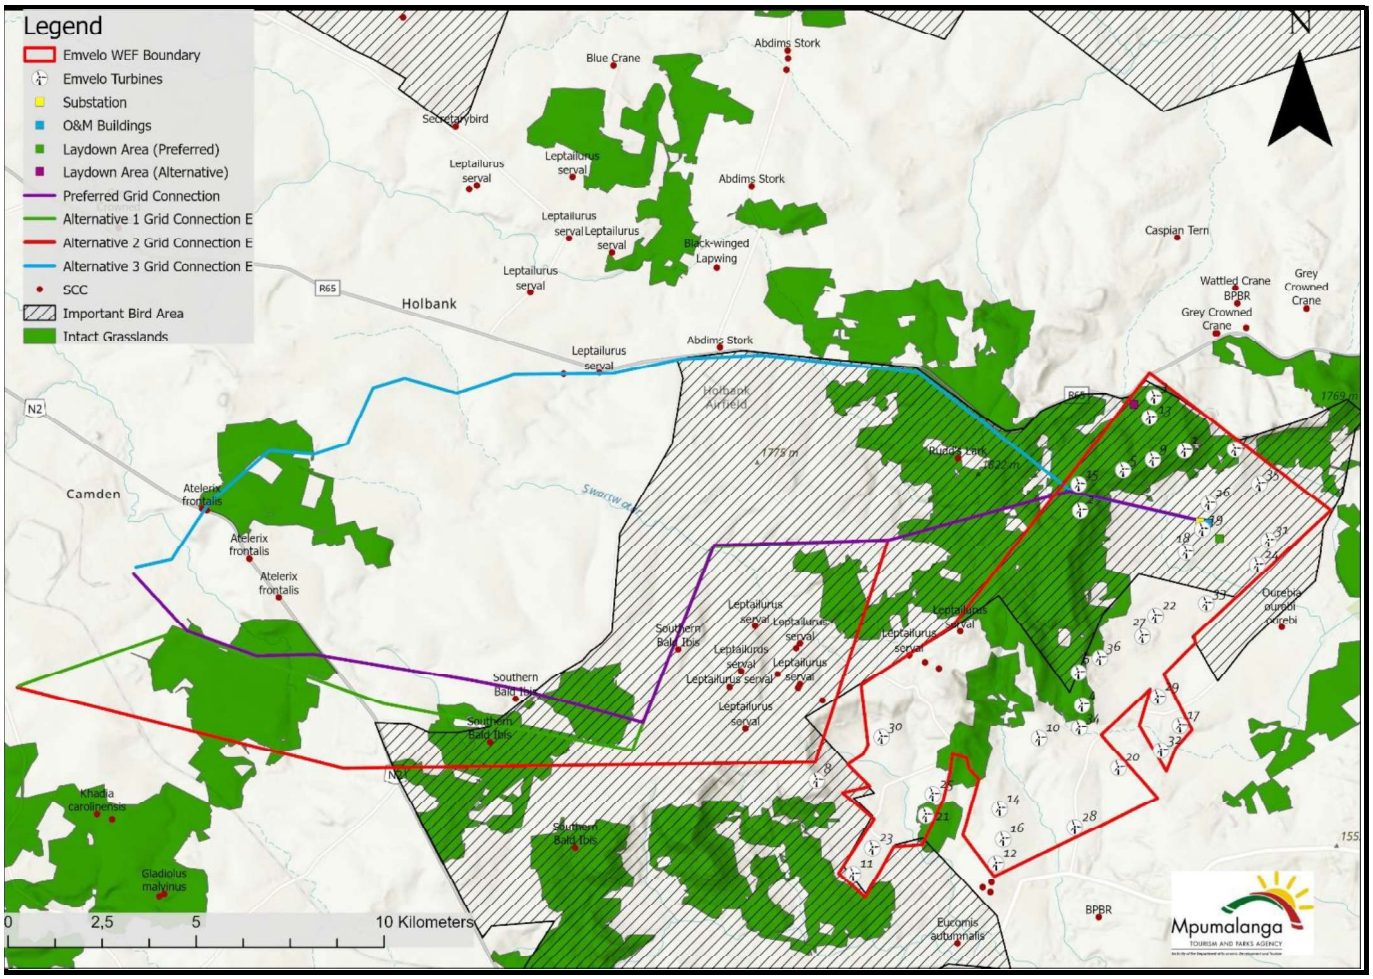

Figure 3. MBSP based Intact Grasslands map for the Emvelo Wind Energy Facility.

Please do not hesitate to contact this office if there are any enquiries.

Email: ERM.ArcusAmsterdam@erm.com

Dear Ms., Gopaul

SUBJECT: THE MTPA REVIEW AND COMMENTS ON THE DRAFT SCOPING REPORTIT, ONVERWACHTOSED 240 MW ROCHDALE WIND ENERGY FACILITY (30 TURBINES) ON PORTIONS 1,2 AND 5 OF THE FARM SCHIMMELHOEK 272 IT AND ASSOCIATED 132 Kv GRID INFRASTRUCTURE TRANSVERSING OVER SEVERAL PORTIONS OF THE FARMS SCHIMMELHOEK 272 IT, ONVERWACHT 273, ZWARTWATER 288, WELTERVREDEN 289 AND WITPUNT 267 APPROXIMATELY 31.5 KM BY ROCHDALE WIND ENERGY FACILITY (PTY) LTD NEAR ERMELO, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE.

With reference to your correspondence reference 0684401 of date 28/08/2024 our comments:

The application has been assessed by using the following tools: Mpumalanga Biodiversity Sector Plan (2014 as updated 2022) land use guidelines, the DFFE web-based sensitivity screening tool, Environmental legislation NEMA and EIA regulations 2014 as amended, Department of Water and Sanitation and Water Research Commission Guidelines on wetlands, the South African Heritage Resources Act and knowledge to assess Development Applications.

The sensitivity of the area, in which the prospecting activity is proposed and is likely to occur was assessed according to the Mpumalanga Biodiversity Sector plan (MBSP; MTPA, 2014). The sensitivity is assessed in terms of terrestrial and freshwater assessments. In the MBSP, sensitivity areas are identified in terms of *Critical Biodiversity Areas* (CBAs) and *Ecological Support Areas* (ESAs). CBAs and ESAs are deemed to be necessary to ensure the protection of biodiversity, environmental sustainability and sustainable living and are to remain unaltered.

With reference to the assessment of your Draft Scoping Report the MTPA is concerned about the following issues raised with regards to the terms of reference for specialist studies.

1. The applicant needs to look for an alternative less sensitive development site to develop the wind energy facility.
2. The avoidance of large areas of critical biodiversity terrestrial and freshwater sensitivity areas and the preliminary project layout overlain area is a large concern especially in the southeastern part of the study area.
3. The threat of this WEF to the Important Bird Area (IBA) and the status of globally Endangered bird species such as the Martial Eagle is of a concern.
4. Road network and its impact must be indicated and must be placed away from the sensitive zones.
5. A 1 km buffer from the CBA Rivers must be applied. Wherever wetland and river crossings are needed, the EIA regulations must be followed.
6. The potential risk and threat of infrastructure-induced fires occurring on grasslands and impacting Species of Conservation Concern (SCC) must be incorporated into the risk assessments.

Proliferation of renewable energy applications

- While South Africa's energy needs highlight the urgency of shifting from coal to renewable energy, it is crucial to consider the scale of investments and the rapid growth of renewable energy projects, especially in Mpumalanga. The drive to approve nearly all renewable applications must be carefully balanced with proper planning and sustainability, ensuring that the transition aligns with environmental, economic, and social factors specific to the region.
- The explosion of renewable energy applications does require careful consideration as to the likely impacts. There is no shortage of renewable energy projects within the Province and the Province has room to apply its mind and navigate this space carefully, especially on areas that are not part of the Renewable Energy Development Zones (REDZs) The province has now over 300 000 ha of renewable energy applications, and the many more than are still to be submitted.

Mpumalanga Biodiversity Sector Plan (MBSP), Intact Grassland Patches and Important Bird Areas (IBAs)

- Majority of the proposed turbines and associated infrastructure such as the laydown structure and grid connections are in environmental sensitives areas(CBA Irreplaceable 1,399.9, CBA Optimal ,Intact grassland areas, Priority Focus Area and Key Biodervisity Areas).The MTPA is also not satisfied with the alternative proposed development sites as they are still placed within the environmental sensitive areas, with the grid connections traversing over the Important Bird Areas(IBA) and the buffer of the Martial Eagle Nest.

- The proposed Rochdale Wind Energy Facility is less than 1 km from an Important Bird Area (IBA), and it is important to note that Birds of SCC were recorded in the broader area, therefore the proposed project might impact these Birds of SCC.

- With the vantage points provided, some of the proposed wind turbines are not visible from the vantage point and, although additional vantage points and transect count monitoring was conducted near the Martial Eagle nest. However, with the possibility of the presence of species 23, and a high diversity of threatened bird species, including the threatened birds confirmed on site: African Marsh Harrier Denham's Bustard, Secretary bird, White-bellied Bustard, Blue Crane, Grey Crowned Crane, Lanner Falcon Greater Flamingo, Southern Bald Ibis, Cape Vulture, and Yellow-breasted Pipit. The MTPA is concerned that the survey effort is not sufficient to adequately find possible breeding and nest sites of species 23 and to assess cumulative impacts and identify appropriate avoidance and mitigation measures for the threatened and vulnerable species. Therefore, the MTPA requests the applicant, to do additional vantage point monitoring not only for the martial eagle, but to ascertain if species 23 is present or not this must be done to satisfy and honour the African-Eurasian Migratory Waterbird Agreement.
- Intact grassland patches are areas larger than 100ha, with little or no gaps or edge effects. They were then prioritised according to their connectivity importance. These intact grasslands are "source" areas for avifaunal species where birth rates are expected to exceed death rates, and no wind farms should be placed anywhere near these intact grassland patches. Proposed Turbine 8 falls within the intact grassland patches,140 Ha is identified as an area with intact grassland. With only 51% of the grasslands remaining in a natural state, very little intact natural grasslands still occur in Mpumalanga. Therefore, the MTPA sees the need to protect the little intact grassland still occurring, therefore turbine 8 should be excluded.
- Majority of proposed project area mainly falls within the Eastern Highveld Grassland (Endangered). A high proportion of this vegetation type is threatened and is generally poorly protected. Hence, it should be carefully managed for the persistence of biodiversity; large areas of natural habitat are needed for many bird species, plants, and numerous wetlands that the Mesic Highveld Grassland supports.
- The proposed project area has a portion of Wakkerstroom Montane Grassland (Least Concern). A variety of land-uses are supported by this area and the conservation and good management of this area depends on the continued land-uses practices that have been able to support this biodiversity. The importance of sustainable development is crucial to the long-term maintenance of the biodiversity and ecosystem services in this area.
- Wind farms should not be placed in intact grassland areas as these are important areas where avifauna should be allowed to thrive and then disperse to other areas.
- Approval of the project in such a location could have far-reaching consequences for threatened bird species, potentially disrupting vital source areas critical for population sustainability.
- It is imperative to adopt a precautionary approach and prioritize the conservation of these essential habitats.

Avifaunal concerns

- The presence of 32 priority bird species for wind energy developments and of the 32,12 priority bird species for wind energy developments were recorded within the footprint area and 19 priority species were also recorded, of which the Southern Bald Ibis were nesting with chicks.

- A Martial Eagle nest (Endangered) occurs within the footprint area. These are South Africa's largest eagles and travel over vast areas. They are also suspectable to collision with turbines and wind farms are of serious concern, therefore according to the Endangered Wildlife Trust a 5km buffer must be applied and adhered to throughout the wind facility life cycle. Four of the proposed turbines (3, 4,13 and 14) are within the buffer of the Martial Eagle therefore these turbines need to be excluded.
- Southern Bald Ibis colonies, Yellow-breasted Pipit, Secretary bird nest occur within footprint area. Therefore, the applicant needs to consider that birds are very mobile and with the proposed turbine height and blade lengths adequate buffers must be assigned.
- This raises particular concern as these birds may continuously collide with the blades of the wind turbines and the continuous loss of several of these long-lived birds every year may have a significant impact on population status.
- The water bodies in the area are important for migrating birds such as flamingos for bathing and drinking, therefore they need to be buffered on either site for the entire during of the project life cycle.

Site Sensitivity Verification

- The results of the Site Sensitivity Verification confirmed that:
    - The sensitivity for the Terrestrial biodiversity impact assessment as Very High/High in grassland and wetland habitat
    - Aquatic Biodiversity Impact Assessment as High Sensitivity
    - Plant Species Assessment as Medium Sensitivity
    - Animal Species Assessment as High Sensitivity
    - Bat Assessment as Very High Sensitivity/High Sensitivity
    - Avifaunal Assessment as Vey High Sensitivity/High Sensitivity

Additional concerns

- Not all the infrastructure has been included on the map or addressed in terms of likely impact. The length of internal roads must be included, and the impact be declared.

Recommendations

- Additional Vantage points must be conducted to establish if species 23(Critically endangered) is present or not to provide more details regarding the potential impacts on the critical species.
- There should be an Oribi management plan in place. The plan should include how this area can be utilized as a sanctuary for the Oribi.
- The EWT's recommended 5 km buffer for the Martial Eagle's nest is non-negotiable and should be adhered to throughout the project lifecycle.
- The location of all but 3 turbines is in avifaunal exclusion zones. However, according to the MBSP proposed turbine 5 is in an CBA Irreplaceable area. Therefore only two proposed turbines ,turbine 15 and 14 are in Heavily Modified or Moderately Modified Areas ,however with some of the SCC

roosting and nesting in trees of alien invasive species ,and cultivated/vegetated lands which might be utilized for feeding areas for many Species of Conservation Concern such as white bellied bustard(Vulnerable)recorded on the broader area, therefore even the Heavily Modified or moderately Modified Areas might not be suitable for the placement of the proposed turbines as they might also be utilized by the birds.

- The current identified Avifaunal Sensitivities map of all 'no-go' areas (Figure (i)) indicates little area for available for the wind farm. With additional monitoring done appropriate buffers must be applied, and all the associated infrastructure such as roads and lay down structures removed from the sensitive areas, the MTPA cannot see how it would be possible to establish a wind farm within the proposed footprint area.
- Increase buffer zones for endangered bird nesting sites to reflect their wider flight ranges relative to the height of the turbines.
- Consider alternative locations with less ecological sensitivity, especially considering the numerous renewable energy projects already approved in Mpumalanga.

Conclusion:

The proposed Rochdale Wind Energy Facility and associated infrastructure poses a significant threat to the Critical Biodiversity Areas, intact grassland patches, Important Bird areas, Key Biodervisity Areas and the habitat of numerous threatened bird species. If we need to rely on the information presented to date, and the desktop assessments, then it is in our opinion that this project is fatally flawed. When considering the cumulative impact of the entire Rochdale Wind Energy Facility the anticipated environmental impacts on biodiversity, particularly on the avifauna, this project becomes a significant concern. The MTPA suggests that the applicant explores alternative locations, that are less environmental sensitive as it crucial before proceeding with this project.

Comments
The application was assessed by using the following tools: Mpumalanga Biodiversity Sector Plan (MBSP, 2014 as updated 2022) land use guidelines, DFFE web-based sensitivity screening tool, Environmental legislation NEMA and EIA regulations 2014 as amended, Department of Water and Sanitation and Water Research Commission Guidelines on wetlands, South African Heritage Resources Act and knowledge to assess Development Applications.

The sensitivity of the proposed project area was assessed according to the MBSP. This sensitivity is assessed in terms of terrestrial and freshwater assessments. In the MBSP, sensitivity areas are identified in terms of *Critical Biodiversity Areas* (CBAs) and *Ecological Support Areas* (ESAs). CBAs and ESAs are deemed to be necessary to ensure the protection of biodiversity, environmental sustainability and sustainable living and are to remain unaltered.

With reference to the assessment of your Draft Scoping Report the MTPA is concerned about the following issues raised with regards to the terms of reference for specialist studies.

- The applicant needs consider an alternative, less sensitive development site to develop the wind energy facility.
- The avoidance of large areas of critical biodiversity terrestrial and freshwater sensitivity areas and the preliminary project layout overlain area is a large concern especially in the southeastern part of the study area.
- The threat of this Wind Energy Facility (WEF) to the Important Bird Area (IBA) and the status of globally Endangered bird species such as the Martial Eagle is of a concern.
- The road network and its impact must be indicated on maps and must be placed away from the sensitive zones.
- A 1 km buffer from the CBA Rivers must be applied. Wherever wetland and river crossings are needed, the Environmental Impact Assessment (EIA) regulations must be followed.
- The potential risk and threat of infrastructure-induced fires occurring on grasslands and impacting Species of Conservation Concern (SCC) must be incorporated into the risk assessments.

Proliferation of renewable energy applications

- While South Africa's energy needs highlight the urgency of shifting from coal to renewable energy, it is crucial to consider the scale of investments and the rapid growth of renewable energy projects, especially in Mpumalanga. The drive to approve nearly all renewable applications must be carefully balanced with proper planning and sustainability, ensuring that the transition aligns with environmental, economic, and social factors specific to the region.
- The increase in renewable energy applications does require careful consideration as to the likely impacts. There is no shortage of renewable energy projects within the Province and the Province has room to apply its mind and navigate this space carefully, especially on areas that are not part of the Renewable Energy Development Zones (REDZs) The province has now over 300 000 ha of renewable energy applications, and the many more than are still to be submitted.

Mpumalanga Biodiversity Sector Plan (MBSP), Intact Grassland Patches and Important Bird Areas (IBAs)

- Most of the proposed turbines and associated infrastructure, such as the laydown structure and grid connections, are in environmentally sensitive areas (CBA Irreplaceable 1,399.9, CBA Optimal ,Intact grassland areas, Priority Focus Area and Key Biodiversity Areas).The MTPA is not satisfied with the alternative proposed development sites as they are still placed within the environmental sensitive areas, with the grid connections traversing over the Important Bird Areas(IBA) and the buffer of the Martial Eagle Nest.
- The proposed Rochdale Wind Energy Facility is less than 1 km from an Important Bird Area (IBA), and it is important to note that Birds of SCC were recorded in the broader area, therefore the proposed project might impact these Birds of SCC.
- With the vantage points provided, some of the proposed wind turbines are not visible from the vantage point and, although additional vantage points and transect count monitoring was conducted near the Martial Eagle nest. There is a possibility of the presence of 23 species, and a high diversity

of threatened bird species, including the threatened birds confirmed on site, such as: African Marsh Harrier Denham's Bustard, Secretary bird, White-bellied Bustard, Blue Crane, Grey Crowned Crane, Lanner Falcon Greater Flamingo, Southern Bald Ibis, Cape Vulture, and Yellow-breasted Pipit. The MTPA is concerned that the survey effort is not sufficient to adequately find possible breeding and nest sites of 23 species, and to assess cumulative impacts and identify appropriate avoidance and mitigation measures for the threatened and vulnerable species. Therefore, the MTPA requests the applicant, to do additional vantage point monitoring not only for the martial eagle, but to ascertain if the 23 species are present or not this must be done to satisfy and honour the African-Eurasian Migratory Waterbird Agreement.

- Intact grassland patches are areas larger than 100ha, with little or no gaps or edge effects. It was then prioritised according to their connectivity importance. These intact grasslands are "source" areas for avifaunal species where birth rates are expected to exceed death rates, and no wind farms should be placed anywhere near these intact grassland patches. Proposed Turbine 8 falls within the intact grassland patches,140 Ha is identified as an area with intact grassland. With only 51% of the grasslands remaining in a natural state, very little intact natural grasslands still occur in Mpumalanga. Therefore, the MTPA sees the need to protect the little intact grassland still occurring, therefore turbine 8 should be excluded.
- Majority of proposed project area mainly falls within the Eastern Highveld Grassland (Endangered). A high proportion of this vegetation type is threatened and is generally poorly protected. Hence, it should be carefully managed for the persistence of biodiversity; large areas of natural habitat are needed for many bird species, plants, and numerous wetlands that the Mesic Highveld Grassland supports.
- The proposed project area has a portion of Wakkerstroom Montane Grassland (Least Concern). A variety of land-uses are supported by this area and the conservation and good management of this area depends on the continued land-uses practices that have been able to support this biodiversity. The importance of sustainable development is crucial to the long-term maintenance of the biodiversity and ecosystem services in this area.
- Wind farms should not be placed in intact grassland areas as these are important areas where avifauna should be allowed to thrive and then disperse to other areas.
- Approval of the project in such a location could have far-reaching consequences for threatened bird species, potentially disrupting vital source areas critical for population sustainability.
- It is imperative to adopt a precautionary approach and prioritize the conservation of these essential habitats.

Avifaunal concerns

- The presence of 32 priority bird species for wind energy developments and of the 32,12 priority bird species for wind energy developments were recorded within the footprint area and 19 priority species were also recorded, of which the Southern Bald Ibis were nesting with chicks.
- A Martial Eagle nest (Endangered) occurs within the footprint area. These are South Africa's largest eagles and travel over vast areas. They are also suspectable to collision with turbines and wind farms are of serious concern, therefore according to the Endangered Wildlife Trust a 5km buffer must be applied and adhered to throughout the wind facility life cycle. Four of the proposed turbines (3, 4,13 and 14) are within the buffer of the Martial Eagle therefore these turbines need to be excluded.

- Southern Bald Ibis colonies, Yellow-breasted Pipit, Secretary bird nest occur within footprint area. Therefore, the applicant needs to consider that birds are very mobile and with the proposed turbine height and blade lengths adequate buffers must be assigned.
- This raises particular concern as these birds may continuously collide with the blades of the wind turbines and the continuous loss of several of these long-lived birds every year may have a significant impact on population status.
- The water bodies in the area are important for migrating birds such as flamingos for bathing and drinking, therefore they need to be buffered on either site for the entire during of the project life cycle.

Site Sensitivity Verification

- The results of the Site Sensitivity Verification confirmed that:
    - The sensitivity for the Terrestrial biodiversity impact assessment as Very High/High in grassland and wetland habitat
    - Aquatic Biodiversity Impact Assessment as High Sensitivity
    - Plant Species Assessment as Medium Sensitivity
    - Animal Species Assessment as High Sensitivity
    - Bat Assessment as Very High Sensitivity/High Sensitivity
    - Avifaunal Assessment as Vey High Sensitivity/High Sensitivity

Additional concerns

- Not all the infrastructure has been included on the map or addressed in terms of likely impact. The length of internal roads must be included, and the impact be declared.

Recommendations

- Additional Vantage points must be conducted to establish if 23 species (Critically endangered) are present or not to provide more details regarding the potential impacts on the critical species.
- An Oribi management plan should be in place. The plan should include how this area can be utilized as a sanctuary for the Oribi.
- The Endangered Wildlife Trust's (EWT) recommended 5 km buffer for the Martial Eagle's nest is non-negotiable and should be adhered to throughout the project lifecycle.
- The location of all but 3 turbines is in avifaunal exclusion zones. However, according to the MBSP proposed turbine 5 is in an CBA Irreplaceable area. Therefore only two proposed turbines ,turbine 15 and 14 are in Heavily Modified or Moderately Modified Areas, however with some of the SCC roosting and nesting in trees of alien invasive species ,and cultivated/vegetated lands which might be utilized for feeding areas for many Species of Conservation Concern such as white bellied bustard(Vulnerable)recorded on the broader area, therefore even the Heavily Modified or moderately Modified Areas might not be suitable for the placement of the proposed turbines as they might also be utilized by the birds.
- The current identified Avifaunal Sensitivities map of all 'no-go' areas (Figure (i)) indicates little area for available for the wind farm. With additional monitoring done appropriate buffers must be applied, and all the associated infrastructure such as roads and lay down structures removed from the

sensitive areas, the MTPA cannot see how it would be possible to establish a wind farm within the proposed footprint area.

- Increase buffer zones for endangered bird nesting sites to reflect their wider flight ranges relative to the height of the turbines.
- Consider alternative locations with less ecological sensitivity, especially considering the numerous renewable energy projects already approved in Mpumalanga.

Figure 1. MBSP terrestrial biodiversity map of the proposed wind turbines on portions 1,2 and 5 of the farm Schimmelhoek 272 IT and grid connection on various affected farm portions

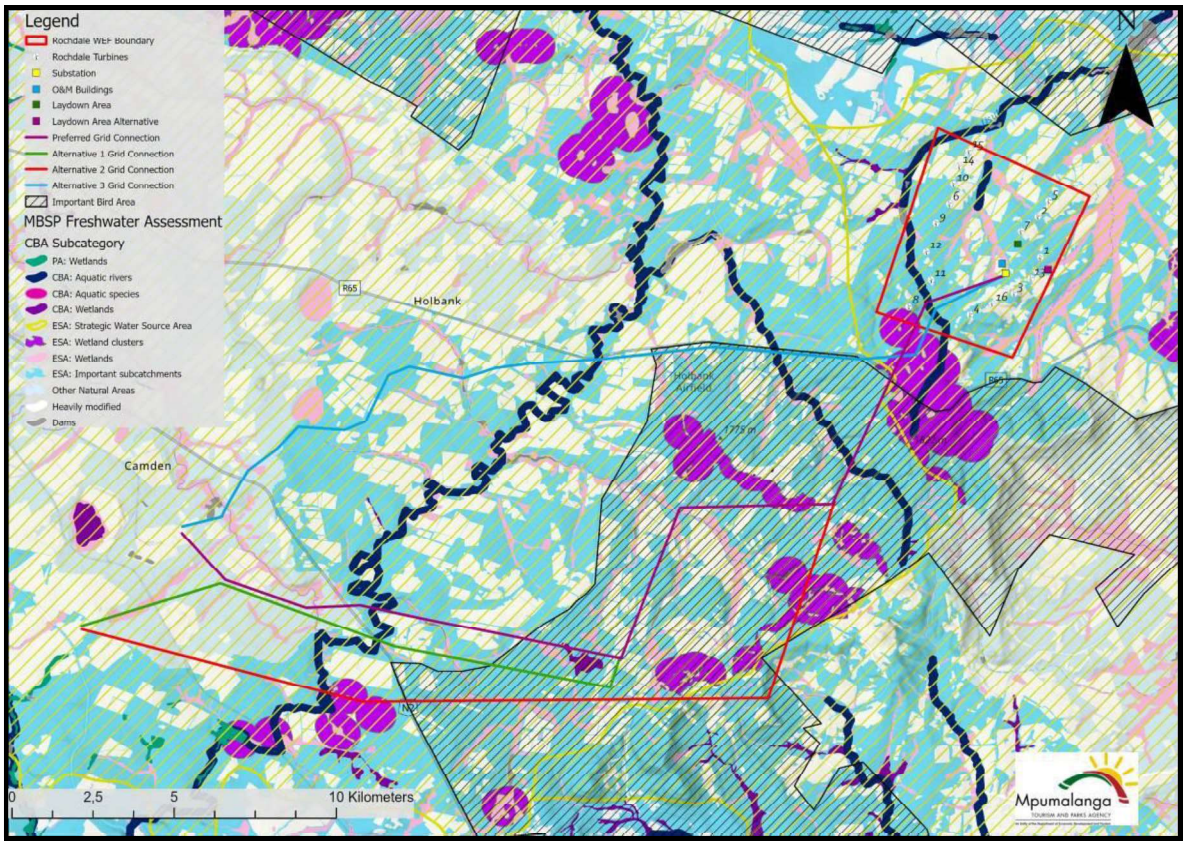

Figure 2: MBSP freshwater biodiversity map of the proposed wind turbines on portions 1,2 and 5 of the farm Schimmelhoek 272 IT and grid connection on various affected farm portions

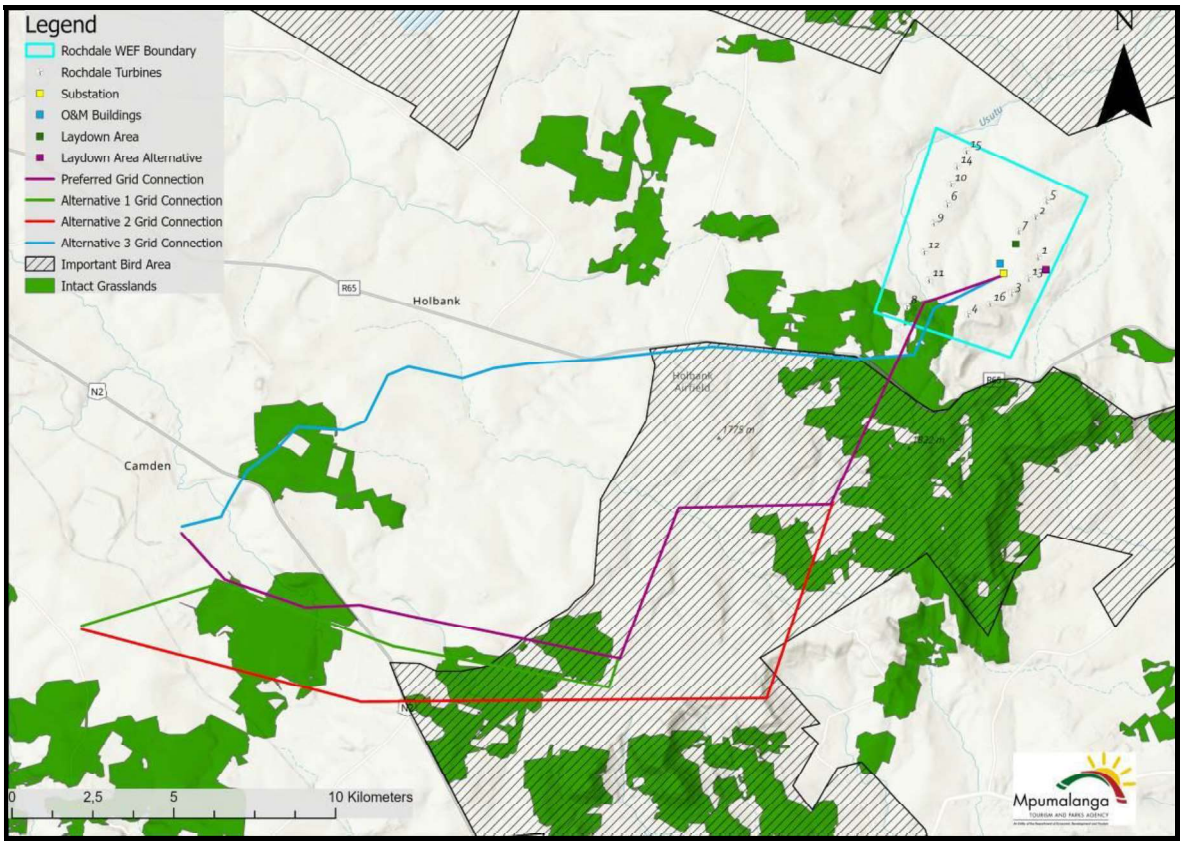

Figure 3: MBSP intact grassland map of the proposed wind turbine portions 1,2 and 5 of Schimmelhoek 272 IT and grid connection on various affected farm portions

Conclusion:

The proposed Rochdale Wind Energy Facility and associated infrastructure pose a significant threat to the Critical Biodiversity Areas, intact grassland patches, Important Bird areas, Key Biodiversity Areas and the habitat of numerous threatened bird species. If we rely on the information presented to date, and desktop assessments, then,in our opinion that this project is fatally flawed. When considering the cumulative impact of the entire Rochdale Wind Energy Facility the anticipated environmental impacts on biodiversity, this project becomes a significant concern, particularly on the avifauna. The MTPA suggests that the applicant explores alternative locations, that are less environmental sensitive as it crucial before proceeding with this project.

Please do not hesitate to contact this office if there are any enquiries.

Hi Josua,

Thank you for sharing your concerns about the proposed WEF cluster. We appreciate your input. Your comments will be considered during the Environmental Impact Assessment (EIA) phase.

As part of the process, we will assess potential changes to the wind turbine layout and work to avoid sensitive areas to minimize any negative impacts. Your feedback appreciated and we will keep you updated as the EIA progresses.

Kind regards,

ERM

Email: ERM.ArcusAmsterdam@erm.com

Dear Ms., Gopaul

SUBJECT: THE MTPA COMMENTS ON THE DRAFT ENVIRONMENTAL SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY (WEF) (23 WIND TURBINES) AND AUXILIARY INFRASTRUCTURE (1 ON-SITE SUBSTATION WITH A CAPACITY OF 132Kv, AND 1 OVER-HEAD POWERLINE OF APPROXIMATELY 22.3 KM) ON SEVERAL PORTIONS OF FARMS COVERING AN AREA OF 5 918 HA EAST OF ERMELO FOR SHEEPMOOR WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE NUMBER TO BE PROVIDED.

With reference to your correspondence reference **Project no: 0684401** of August 2024, herewith the MTPA comments.

The application has been assessed by using the following tools: Mpumalanga Biodiversity Sector Plan (2014 as updated 2022) land use guidelines, the DFFE web-based sensitivity screening tool, Environmental legislation NEMA and EIA regulations 2014 as amended, Department of Water and Sanitation and Water Research Commission Guidelines on wetlands, the South African Heritage Resources Act and knowledge to assess Development Applications.

The sensitivity of the area, in which the prospecting activity is proposed and is likely to occur was assessed according to the Mpumalanga Biodiversity Sector plan (MBSP; MTPA, 2014). The sensitivity is assessed in terms of terrestrial and freshwater assessments. In the MBSP, sensitivity areas are identified in terms of *Critical Biodiversity Areas* (CBAs) and *Ecological Support Areas* (ESAs). CBAs and ESAs are deemed to be

necessary to ensure the protection of biodiversity, environmental sustainability and sustainable living and are to remain unaltered.

Comments with regards to the terms of reference for studies needed:

With reference to the assessment of your Draft Scoping Report the MTPA is concerned about the following issues raised with regards to the terms of reference for specialist studies to be done.

1. The alternative sites, although less sensitive to the preferred site, are still located in sensitive areas.
2. Ground truthing and on-site studying of areas regarded as degraded or sensitive and suitable for potential wind turbines must be done considering that cultivated/vegetated lands might be feeding areas for many Species of Conservation Concern. The Site sensitivity verification report must include the feeding areas for SCC.
3. The avoidance of large areas of critical biodiversity terrestrial and freshwater sensitivity areas and the preliminary project layout overlain area is a large concern especially in the southeastern part of the study area.
4. The threat of this WEF to the Important Bird Area and the status of globally threatened bird species such as the Southern Bald Ibis and Secretary bird is of concern. The onsite avifaunal study must include local knowledge of the distribution of large birds especially the Blue crane that is a local migrant during the wintertime.
5. Included in the MTPA's comments are the following discussion that illustrates the **need and desirability** of this proposal:

Renewable energy applications

- Given the energy needs of the country, significant emphasis is being placed on the need to transition away from coal towards renewable energy. However, the urgency and desire to approve nearly all renewable energy applications needs to be put into perspective considering the incredible investment and proliferation of new renewable energy projects within Mpumalanga.
- The MTPA and DARDLEA are maintaining a database of renewable energy projects, which include those in the pre-application phase. We can confirm that 61 renewable energy projects have now been submitted within Mpumalanga. Just over 50% of these have been approved to date. 18 of these are for Wind Energy Farms, which together make up for over 233 000 ha, and this amount is growing as the province is being inundated with renewable energy applications.
- The explosion of renewable energy applications does require careful consideration as to the likely impacts. There is no shortage of renewable energy projects within the Province and the Province has room to apply its mind and navigate this space carefully. The province has now over 300 000 ha of renewable energy applications, and the many more than are still to be submitted.

Mpumalanga Biodiversity Sector Plan (MBSP), Intact Grassland Patches and Important Bird Areas (IBAs)

- The project **footprint overlaps with a significant amount of Critical Biodiversity Areas** (CBA). 1 488.9 ha (over 28%) of the footprint area is identified as a CBA. Wind farms are not appropriate land uses within CBA areas. Two proposed wind turbines are placed in CBA Irreplaceable areas.
- The MBSP Terrestrial assessment indicates that the project footprint is within CBA: Irreplaceable, CBA: Optimal, ESA: Local Corridor, ESA: Landscape Corridor, ESA: Species Specific, Other Natural Areas, Moderately Modified, and Heavily Modified Areas.
- The MBSP Freshwater Assessment indicates that the project footprint is within ESA: Strategic Water Source Areas, and has CBA: Aquatic River, ESA: Wetland Clusters, ESA: Wetlands, ESA: Important Sub-catchments, Other Natural and Heavily Modified Areas.
- ESA: Strategic Water Source Area (SWSAs) maintain ecological integrity across the entire sub-catchment, paying particular attention to maintaining water quality, water quantity, and habitat integrity. They represent 10% of the surface area producing approximately 50% of Mpumalanga's water. The proposed WEF activity in the area might compromise the quality and quantity of the surface water resources through siltation.
- The whole of the proposed Sheepmoor wind farm falls within an Important Bird Area (IBA), which underscores the need to consider its implications on metapopulation dynamics and the need to avoid wind farms in "source" areas.
- The project area mainly falls within the Mesic Eastern Highveld Grassland (Endangered). A high proportion of this vegetation type is threatened and is generally poorly protected. Hence, it should be carefully managed for the persistence of biodiversity; large areas of natural habitat are needed for many bird species, plants, and numerous wetlands that the Mesic Highveld Grassland supports.
- The proposed project area has a portion of Wakkerstroom Montane Grassland (Least Concern). A variety of land-uses are supported by this area and the conservation and good management of this area depends on the continued land-uses practices that have been able to support this biodiversity. The importance of sustainable development is crucial to the long-term maintenance of the biodiversity and ecosystem services in this area.
- 2 143.6 ha (36 %) of the proposed wind farm is comprised of intact grassland patches. With only 51% of the grasslands remaining in a natural state, very little intact natural grasslands still occur in Mpumalanga. Three proposed wind turbines are placed in intact grassland patches.
- Intact grassland patches are areas larger than 100ha, with little or no gaps or edge effects. They were then prioritised according to their connectivity importance. These intact grasslands are "source" areas for avifaunal species where birth rates are expected to exceed death rates, and no wind farms should be placed anywhere near these intact grassland patches.
- The identification of actual avifaunal source areas may be difficult, but as these intact grassland patches occur within an Important Bird Area (IBA) where there are several nesting and roosting avifaunal species of conservation concern, it highlights their significance and our confidence in confirming these as "source" areas. The presence of these intact grassland patches, CBAs, and the IBAs, is probably the biggest concern that the MTPA may have about the proposed wind farm.

- 84 % of the proposed study area is Important Bird Area and 9.3% of the proposed study area is a Key Biodiversity Area.
- Wind farms are not to be placed in IBAs or intact grassland areas as these are important areas where avifauna should be allowed to thrive and then disperse to other areas.
- Approval of the project in such a location could have far-reaching consequences for threatened bird species, potentially disrupting vital source areas critical for population sustainability.
- The south of the project area falls within the National Protected Areas Expansion Strategy (NPAES) Focus Area (Moist Escarpment Grasslands). The Chrissiesmeer Protected Environment overlaps the north of the project area and Jericho Dam Nature Reserve overlaps the eastern part of the project area.
- It is imperative to adopt a precautionary approach and prioritize the conservation of these essential habitats.

Avifaunal concerns

- **Thirteen out of the 23 proposed wind turbines are placed within the 5 km buffer of a Martial Eagles' recommended buffer these should be removed.**
- 26% of the proposed wind turbines are not covered by vantage points.
- The presence of priority bird species for wind energy developments were recorded within the footprint area.
- Two Southern Bald Ibis colonies (Vulnerable) occur within footprint area.
- A Secretary bird nest (Endangered) was found within this area.
- Birds are very mobile and with the proposed turbine height and blade lengths, the current proposed buffers seem inadequate.
- This raises particular concern as these birds may continuously collide with the blades of the wind turbines and the continuous loss of several of these long-lived birds every year may have a significant impact on population status.
- The artificial water bodies within the footprint area may be important for flamingos and other water-dependent birds.

Site Sensitivity Verification

- The results of the Site Sensitivity Verification confirmed that:
    - The sensitivity for the Terrestrial biodiversity impact assessment as Very High in grassland and wetland habitat.
    - Aquatic Biodiversity Impact Assessment as Very High Sensitivity
    - Plant Species Assessment as Medium Sensitivity
    - Animal Species Assessment as High Sensitivity
    - Bat Assessment Very High/High Sensitivity
    - Avifaunal Assessment as Very High/High Sensitivity.

Additional concerns

- Not all the infrastructure has been included on the map or addressed in terms of likely impact, in this case, roads.

Recommendations:

- There should be a thorough Oribi census plan in place, and it should be included in the final EIA report as the project area is home to many Oribi antelope. (Red data species dependant on healthy highveld grasslands).
- Species 23 must be accounted for, and a management plan drawn up for it since the project area is a potential site for its occurrence.
- The EWT's recommended 5 km buffer for the Martial Eagle's nest is non-negotiable and should be adhered to throughout the project lifecycle.
- The current identified Avifaunal Sensitivities map of all 'no-go' areas (Figure (I)) indicates little area for available for the wind farm. With more appropriate buffers, more field work, and all the associated infrastructure (such as roads), we cannot see how it would be possible to establish a wind farm within the footprint area.
- Increase buffer zones for endangered bird nesting sites to reflect their wider flight ranges relative to the height of the turbines.
- Consider alternative locations with less ecological sensitivity, especially considering the numerous renewable energy projects already approved in Mpumalanga.

Conclusion:

The proposed Sheepmoor Wind Energy Facility poses a significant threat to a Critical Biodiversity Areas, intact grassland patches, Important Bird areas, and the habitat of numerous threatened bird species. Relying on the information presented to date, and the desktop assessments, **it is in the MTPA's opinion that this project is fatally flawed.** The anticipated impacts on biodiversity, particularly the avifauna, is too great to support this project. More ecological assessments and exploration of alternative locations are crucial before proceeding with this project.

Please do not hesitate to contact this office if there are any inquiries.

Kind Regards

SUBJECT: THE MTPA REVIEW AND COMMENTS ON THE DRAFT SCOPING REPORTIT, ONVERWACHTOSED 240 MW ROCHDALE WIND ENERGY FACILITY (30 TURBINES) ON PORTIONS 1,2 AND 5 OF THE FARM SCHIMMELHOEK 272 IT AND ASSOCIATED 132 Kv GRID INFRASTRUCTURE TRANSVERSING OVER SEVERAL PORTIONS OF THE FARMS SCHIMMELHOEK 272 IT, ONVERWACHT 273, ZWARTWATER 288, WELTERVREDEN 289 AND WITPUNT 267 APPROXIMATELY 31.5 KM BY ROCHDALE WIND ENERGY FACILITY (PTY) LTD NEAR ERMELO, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE.

With reference to your correspondence reference 0684401 of date 28/08/2024 our comments:

The application has been assessed by using the following tools: Mpumalanga Biodiversity Sector Plan (2014 as updated 2022) land use guidelines, the DFFE web-based sensitivity screening tool, Environmental legislation NEMA and EIA regulations 2014 as amended, Department of Water and Sanitation and Water Research Commission Guidelines on wetlands, the South African Heritage Resources Act and knowledge to assess Development Applications.

The sensitivity of the area, in which the prospecting activity is proposed and is likely to occur was assessed according to the Mpumalanga Biodiversity Sector plan (MBSP; MTPA, 2014). The sensitivity is assessed in terms of terrestrial and freshwater assessments. In the MBSP, sensitivity areas are identified in terms of *Critical Biodiversity Areas* (CBAs) and *Ecological Support Areas* (ESAs). CBAs and ESAs are deemed to be necessary to ensure the protection of biodiversity, environmental sustainability and sustainable living and are to remain unaltered.

With reference to the assessment of your Draft Scoping Report the MTPA is concerned about the following issues raised with regards to the terms of reference for specialist studies.

1. The applicant needs to look for an alternative less sensitive development site to develop the wind energy facility.
2. The avoidance of large areas of critical biodiversity terrestrial and freshwater sensitivity areas and the preliminary project layout overlain area is a large concern especially in the southeastern part of the study area.
3. The threat of this WEF to the Important Bird Area (IBA) and the status of globally Endangered bird species such as the Martial Eagle is of a concern.
4. Road network and its impact must be indicated and must be placed away from the sensitive zones.
5. A 1 km buffer from the CBA Rivers must be applied. Wherever wetland and river crossings are needed, the EIA regulations must be followed.
6. The potential risk and threat of infrastructure-induced fires occurring on grasslands and impacting Species of Conservation Concern (SCC) must be incorporated into the risk assessments.

Proliferation of renewable energy applications

- While South Africa's energy needs highlight the urgency of shifting from coal to renewable energy, it is crucial to consider the scale of investments and the rapid growth of renewable energy projects, especially in Mpumalanga. The drive to approve nearly all renewable applications must be carefully balanced with proper planning and sustainability, ensuring that the transition aligns with environmental, economic, and social factors specific to the region.
- The explosion of renewable energy applications does require careful consideration as to the likely impacts. There is no shortage of renewable energy projects within the Province and the Province has room to apply its mind and navigate this space carefully, especially on areas that are not part of the Renewable Energy Development Zones (REDZs) The province has now over 300 000 ha of renewable energy applications, and the many more than are still to be submitted.

Mpumalanga Biodiversity Sector Plan (MBSP), Intact Grassland Patches and Important Bird Areas (IBAs)

- Majority of the proposed turbines and associated infrastructure such as the laydown structure and grid connections are in environmental sensitives areas(CBA Irreplaceable 1,399.9, CBA Optimal ,Intact grassland areas, Priority Focus Area and Key Biodervisity Areas).The MTPA is also not satisfied with the alternative proposed development sites as they are still placed within the environmental sensitive areas, with the grid connections traversing over the Important Bird Areas(IBA) and the buffer of the Martial Eagle Nest.

- The proposed Rochdale Wind Energy Facility is less than 1 km from an Important Bird Area (IBA), and it is important to note that Birds of SCC were recorded in the broader area, therefore the proposed project might impact these Birds of SCC.

- With the vantage points provided, some of the proposed wind turbines are not visible from the vantage point and, although additional vantage points and transect count monitoring was conducted near the Martial Eagle nest. However, with the possibility of the presence of species 23, and a high diversity of threatened bird species, including the threatened birds confirmed on site: African Marsh Harrier Denham's Bustard, Secretary bird, White-bellied Bustard, Blue Crane, Grey Crowned Crane, Lanner Falcon Greater Flamingo, Southern Bald Ibis, Cape Vulture, and Yellow-breasted Pipit. The MTPA is concerned that the survey effort is not sufficient to adequately find possible breeding and nest sites of species 23 and to assess cumulative impacts and identify appropriate avoidance and mitigation measures for the threatened and vulnerable species. Therefore, the MTPA requests the applicant, to do additional vantage point monitoring not only for the martial eagle, but to ascertain if species 23 is present or not this must be done to satisfy and honour the African-Eurasian Migratory Waterbird Agreement.
- Intact grassland patches are areas larger than 100ha, with little or no gaps or edge effects. They were then prioritised according to their connectivity importance. These intact grasslands are "source" areas for avifaunal species where birth rates are expected to exceed death rates, and no wind farms should be placed anywhere near these intact grassland patches. Proposed Turbine 8 falls within the intact grassland patches,140 Ha is identified as an area with intact grassland. With only 51% of the grasslands remaining in a natural state, very little intact natural grasslands still occur in Mpumalanga. Therefore, the MTPA sees the need to protect the little intact grassland still occurring, therefore turbine 8 should be excluded.
- Majority of proposed project area mainly falls within the Eastern Highveld Grassland (Endangered). A high proportion of this vegetation type is threatened and is generally poorly protected. Hence, it should be carefully managed for the persistence of biodiversity; large areas of natural habitat are needed for many bird species, plants, and numerous wetlands that the Mesic Highveld Grassland supports.
- The proposed project area has a portion of Wakkerstroom Montane Grassland (Least Concern). A variety of land-uses are supported by this area and the conservation and good management of this area depends on the continued land-uses practices that have been able to support this biodiversity. The importance of sustainable development is crucial to the long-term maintenance of the biodiversity and ecosystem services in this area.
- Wind farms should not be placed in intact grassland areas as these are important areas where avifauna should be allowed to thrive and then disperse to other areas.
- Approval of the project in such a location could have far-reaching consequences for threatened bird species, potentially disrupting vital source areas critical for population sustainability.
- It is imperative to adopt a precautionary approach and prioritize the conservation of these essential habitats.

Avifaunal concerns

- The presence of 32 priority bird species for wind energy developments and of the 32,12 priority bird species for wind energy developments were recorded within the footprint area and 19 priority species were also recorded, of which the Southern Bald Ibis were nesting with chicks.

- A Martial Eagle nest (Endangered) occurs within the footprint area. These are South Africa's largest eagles and travel over vast areas. They are also suspectable to collision with turbines and wind farms are of serious concern, therefore according to the Endangered Wildlife Trust a 5km buffer must be applied and adhered to throughout the wind facility life cycle. Four of the proposed turbines (3, 4,13 and 14) are within the buffer of the Martial Eagle therefore these turbines need to be excluded.
- Southern Bald Ibis colonies, Yellow-breasted Pipit, Secretary bird nest occur within footprint area. Therefore, the applicant needs to consider that birds are very mobile and with the proposed turbine height and blade lengths adequate buffers must be assigned.
- This raises particular concern as these birds may continuously collide with the blades of the wind turbines and the continuous loss of several of these long-lived birds every year may have a significant impact on population status.
- The water bodies in the area are important for migrating birds such as flamingos for bathing and drinking, therefore they need to be buffered on either site for the entire during of the project life cycle.

Site Sensitivity Verification

- The results of the Site Sensitivity Verification confirmed that:
    - The sensitivity for the Terrestrial biodiversity impact assessment as Very High/High in grassland and wetland habitat
    - Aquatic Biodiversity Impact Assessment as High Sensitivity
    - Plant Species Assessment as Medium Sensitivity
    - Animal Species Assessment as High Sensitivity
    - Bat Assessment as Very High Sensitivity/High Sensitivity
    - Avifaunal Assessment as Vey High Sensitivity/High Sensitivity

Additional concerns

- Not all the infrastructure has been included on the map or addressed in terms of likely impact. The length of internal roads must be included, and the impact be declared.

Recommendations

- Additional Vantage points must be conducted to establish if species 23(Critically endangered) is present or not to provide more details regarding the potential impacts on the critical species.
- There should be an Oribi management plan in place. The plan should include how this area can be utilized as a sanctuary for the Oribi.
- The EWT's recommended 5 km buffer for the Martial Eagle's nest is non-negotiable and should be adhered to throughout the project lifecycle.
- The location of all but 3 turbines is in avifaunal exclusion zones. However, according to the MBSP proposed turbine 5 is in an CBA Irreplaceable area. Therefore only two proposed turbines ,turbine 15 and 14 are in Heavily Modified or Moderately Modified Areas ,however with some of the SCC

roosting and nesting in trees of alien invasive species ,and cultivated/vegetated lands which might be utilized for feeding areas for many Species of Conservation Concern such as white bellied bustard(Vulnerable)recorded on the broader area, therefore even the Heavily Modified or moderately Modified Areas might not be suitable for the placement of the proposed turbines as they might also be utilized by the birds.

- The current identified Avifaunal Sensitivities map of all 'no-go' areas (Figure (i)) indicates little area for available for the wind farm. With additional monitoring done appropriate buffers must be applied, and all the associated infrastructure such as roads and lay down structures removed from the sensitive areas, the MTPA cannot see how it would be possible to establish a wind farm within the proposed footprint area.
- Increase buffer zones for endangered bird nesting sites to reflect their wider flight ranges relative to the height of the turbines.
- Consider alternative locations with less ecological sensitivity, especially considering the numerous renewable energy projects already approved in Mpumalanga.

Conclusion:

The proposed Rochdale Wind Energy Facility and associated infrastructure poses a significant threat to the Critical Biodiversity Areas, intact grassland patches, Important Bird areas, Key Biodervisity Areas and the habitat of numerous threatened bird species. If we need to rely on the information presented to date, and the desktop assessments, then it is in our opinion that this project is fatally flawed. When considering the cumulative impact of the entire Rochdale Wind Energy Facility the anticipated environmental impacts on biodiversity, particularly on the avifauna, this project becomes a significant concern. The MTPA suggests that the applicant explores alternative locations, that are less environmental sensitive as it crucial before proceeding with this project.

Dear Ms., Gopaul

SUBJECT: MTPA'S COMMENTS REGARDING THE DRAFT SCOPING FOR THE 45 WIND TURBINES EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE,) AND AUXILIARY INFRASTRUCTURE (1 ON-SITE SUBSTATION WITH A CAPACITY OF 200MW, AND 1 OVER-HEAD 132 kV POWERLINE OF APPROXIMATELY 30 KM) ON 18 PORTIONS OF FARMS COVERING AN AREA OF 6 964 HA EAST OF ERMELO FOR EMVELO WIND ENERGY FACILITY (PTY) LTD, MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE. DFFE REFERENCE NUMBER TO BE PROVIDED. MPUMALANGA PROVINCE.

Your correspondence with the project ref no. 0684401 of date 28/08/2024.

COMMENTS AND CONCERNS:

The sensitivity of the above farm on which the proposed activity is likely to occur was assessed according to the Mpumalanga Biodiversity Sector Plan (MBSP; MTPA, 2014). This sensitivity is assessed in terms of terrestrial and freshwater assessments. In the MBSP, priority sensitive areas are identified in terms of Critical Biodiversity Areas (CBAs) and Ecological Support Areas (ESAs). CBAs and ESAs are deemed to be necessary to ensure protection of biodiversity, environmental sustainability, and human well-being, and are to remain unaltered.

According to the MBSP terrestrial assessment map (figure 1) the proposed development will occur within CBA Irreplaceable, CBA Optimal, ESA Landscape corridor, ESA Ecological Corridor, Important Bird Areas (IBA), other natural areas, moderately modified- old lands and heavily modified area (Degraded). According to the freshwater assessments map (figure 2), the proposed development will occur within a CBA Aquatic River, CBA wetlands, ESA wetlands, ESA Strategic water source, ESA Important sub-catchments other natural areas and heavily modified area (Degraded).

The MTPA have the following concerns:

The MTPA is concerned with the proposed project area for the Emvelo Wind Energy Facility (WEF) and its associated Auxiliary infrastructure which is within Important Bird Areas (IBA), CBA Irreplaceable, CBA optimal, CBA aquatic rivers, ESA wetland clusters, ESA wetlands and intact grasslands. These areas are of biodiversity importance and the proposed Emvelo WEF and associated infrastructure will compromise the primary biodiversity objectives of these areas.

The MTPA is concerned with a number of turbines that are in no-go areas or highly sensitive areas. There are ten (10) turbines that are located within the intact grasslands which are turbines 1, 2, 3, 4, 5, 6, 7, 9, 13 and 15 (refer to Figure 3), intact grasslands are crucial for supporting threatened avifauna and these turbines will compromise that biodiversity objective. The MBSP specifically incorporated climate change into spatial priorities through the prioritisation of the connectivity of remaining intact grassland patches in the province, as they provide habitat for species to thrive, and allow for their dispersal.

Turbines 12, 14, 16, 17, 29, 32 and 33 are within CBA irreplaceable, which is to be maintained in a natural state with no loss of ecosystems, functionality or species with no flexibility in land-use options. Turbines 8, 18 and 19 are within CBA optimal which is to be maintained in a natural state with no loss of ecosystems, functionality or species with some flexibility in land-use options.

Turbines 1,2,3,5, 9, 11, 13, 15, 18, 19, 22, 24, 26, 31, and 35 are located within Important Bird Area (IBA). The Important Bird Area (IBA) as established by the Birdlife SA are areas that has the richness of conservation important bird species and care should be taken not to lose their breeding and feeding habitats. Wind turbines increase the risk of bird's collision. Surface water (Wetlands, drainage lines and dams) is crucially important for priority Avifauna, wind turbines and powerlines that that are placed near surface water pose a collision risk (as mentioned by the Avifaunal specialist). The most preferred sites are Moderately and Heavily modified areas; other natural areas are also preferred but under certain conditions.

The proposed Emvelo WEF and its associated grid connection is located in an area comprising a high diversity of threatened bird species, including the following confirmed on site: African Marsh Harrier (Regionally Endangered); Martial Eagle (Globally and Regionally Endangered); Denham's Bustard (Globally Near Threatened, Regionally Vulnerable); Secretary bird (Globally Endangered, Regionally Vulnerable); White-bellied Bustard (Regionally Vulnerable), Blue Crane (Globally Vulnerable, Regionally Near Threatened); Grey Crowned Crane (Globally and Regionally Endangered); Lanner Falcon (Regionally Vulnerable); Greater Flamingo (Regionally Near Threatened); Southern Bald Ibis (Regionally and Globally Vulnerable); Cape

Vulture (Globally Vulnerable and Regionally Endangered); and Yellow-breasted Pipit (Regionally and Globally Vulnerable).

Turbines 1, 2, 3, 5, 7, 9, 13 and 15 are within the 5km Martial Eagle Buffer, Birdlife South Africa currently recommends 5-6 km buffer for Martial Eagles, this 5km no-go buffer must be adhered to by the Applicant.

The MTPA would like to recommend the following:

- Key biodiversity areas should be avoided, and Wind turbines removed from such.

- A 100m buffer around wetlands and other waterbodies must be implemented and adhered to throughout the lifecycle of the proposed development.
- 5km radius Martial Eagle Buffer (as recommended by BirdLifeSA) must be implemented and avoided throughout the lifecycle of the proposed development.
- A Thorough Terrestrial Biodiversity assessment which also includes Intact grasslands patches.
- A thorough Avifaunal study must be done with all the best practices to avoid the bird collision risks.
- Proper mitigation strategies of the wind turbines to avoid collisions and mortalities must be included in the EIAr.
- The roads, temporary site camps and all the other associated infrastructure must be included on the site layout of the Emvelo WEF in the EIAr.
- The Applicant must find a more suitable alternative site for this development with less risk to biodiversity.
- The clearance or removal of vegetation must be restricted to the project footprint.
- Moderately modified- old lands and heavily modified areas (Degraded) are the most preferred sites for the Emvelo WEF, other natural areas are also preferred but under certain conditions.
- The applicant must apply duty of care to ensure that there is no significant pollution or degradation of the environment.

The MTPA does not support the Environmental Authorisation of the proposed Emvelo Wind Energy Facility (Pty) Ltd for proposed Wind Energy Facility and Auxiliary infrastructure operation within the application area with up to 45 proposed wind turbines. The sensitive areas cover most of the proposed Emvelo WEF project area, Important Birds Area (IBA) covers 43% of the project area; Key Biodiversity Areas (KBA) Covers 21.4% of the project area; Critical Biodiversity Areas (CBA) covers 1,302.2 ha of the project area; and 2,272.5 ha of intact grassland patches within the project area.

PER E-MAIL

Dear Ms Gopaul

ACCEPTANCE OF THE SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The final Scoping Report (SR) and the Plan of Study for Environmental Impact Assessment (PoSEIA) dated October 2024 and received by the Department on 07 October 2024, refers.

The Department has evaluated the submitted final SR and the Plan of Study for Environmental Impact Assessment dated July 2024 and is satisfied that the documents comply with the minimum requirements of the Environmental Impact Assessment (EIA) Regulations, 2014, as amended. The FSR is hereby accepted by the Department in terms of Regulation 22(a) of the EIA Regulations, 2014, as amended.

You may proceed with the environmental impact assessment process in accordance with the tasks contemplated in the PoSEIA as required in terms of the EIA Regulations, 2014, as amended. The Environmental Impact Assessment Report (EIAr) must comply with the requirements of Appendix 3 of the EIA Regulations, 2014, as amended.

In addition, the following amendments and additional information are required for the EIAr:

The processing of personal information by the Department of Forestry, Fisheries and the Environment is done lawfully and not excessive to the purpose of processing in compliance with the POPI Act, any codes of conduct issued by the Information Regulator in terms of the POPI Act and / or relevant legislation providing appropriate security safeguards for the processing of personal information of others.

MEM

General Comments

1. The meeting minutes in Appendix F of the Public Participation Report refers. The discussions during the meeting with the Mpumalanga Department of Agriculture, Rural Development, Land and Environmental Affairs (DARDLEA) and the Mpumalanga Tourism & Parks Agency (MTPA) on 11 September 2024 are noted.
2. The table of coordinates on page *x* of the SR is noted. The EIAr must include:
   a. The corner coordinates for the Battery Energy Storage System.
   b. Bend point coordinates for the 132kV powerline alternatives; and the main access roads.
3. The EIAr must include the approximate length of each grid connection alternative route, and these grid connection routes must be discussed in the "*Alternatives*" section of the EIAr.
4. You are requested to provide the estimated operational lifespan of the proposed Emvelo WEF and details of future plans for the site and infrastructure after decommissioning, as well as the possibility of upgrading the proposed infrastructure to more advanced technologies.
5. The EIAr must confirm the availability of services identified on pages 124 to 126 of the final SR.
6. If the EIAr contains listed activities and/or other information that differs from the application form, the application form must be amended accordingly and submitted to the Department with the EIAr.

Battery Energy Storage System (BESS)

7. Applicable BESS technologies must be included under the Technology Alternatives section of the EIAr.
8. A risk assessment study is not required for the Battery Energy Storage System (BESS), however, impacts associated with the risks must be identified, considered, and assessed as part of the EIAr.

Public Participation

9. Comments on the draft EIAR must be obtained from this Department's Biodiversity Conservation Directorate at BCAdmin@dffe.gov.za and Protected Areas section (regarding the NPAES) at Tnethononda@dffe.gov.za. Further to that, these comments must be addressed and incorporated in the final EIAr.
10. Proof of correspondence with the various stakeholders must be included in the EIAr. This must indicate that this draft EIAr has been subjected to 30 days public participation process, stating the start and end date of the PPP.
11. Please ensure that comments from all relevant stakeholders are submitted to the Department with the EIAr.
12. Should you be unable to obtain comments, proof should be submitted to the Department of the attempts that were made to obtain comments. Please provide proof of written notice for the availability of the draft EIAr for comment.
13. All issues raised and comments received must be incorporated into the Comments and Response Report (CRR).
14. Comments from I&APs must not be split and arranged into categories. Comments from each submission must be responded to individually.
15. Please refrain from summarising comments made by I&APs. All comments from I&APs must be copied verbatim and responded to clearly. Please note that a response such as "noted" is not regarded as an adequate response to an I&AP's comments.
16. The CRR addresses comments on the draft SR, which have been received from organs of state, however, copies of these comments are not included in the report. Copies of original comments

received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity must be submitted to the Department with the EIAr.

17. If applicable, the attendance registers and minutes of any meetings held by the Environmental Assessment Practitioner (EAP) with Interested and Affected Parties (I&APs) and other role players must be included in the EIAr.
18. The newspaper advert proof in Appendix C of the Public Participation Report refers. Please submit a full page of the newspaper(s) containing the advertisement, ensuring that the name of the newspaper and date are visible.

Specialist assessments

19. Interim and final comments from the South African Heritage Resources Agency (SAHRA) must be addressed and incorporated in the EIAr.
20. Specialist assessments must be conducted in accordance with the Government Notice No. 320 of 20 March 2020 (i.e. "the Protocols"), and Government Notice No. 1150 of 30 October 2020 (i.e. protocols for terrestrial plant and animal species).
21. The following specialist studies will form part of the EIAr as indicated in Section 12.6 of the FSR:
    a. Soil and Agriculture Potential Impact Assessment;
    b. Freshwater and Wetlands (Aquatics) Impact Assessment;
    c. Terrestrial Biodiversity (Flora and Fauna) Impact Assessment;
    d. Avifauna Impact Assessment;
    e. Bat Impact Assessment;
    f. Visual / Landscape and Flicker Impact Assessment;
    g. Heritage, Archaeology and Palaeontology Impact Assessment;
    h. Noise Impact Assessment;
    i. Socio-economic Impact Assessment; and
    j. Traffic and Transportation Impact Assessment.
22. Please note that the Department considers a 'no-go' area, as an area where no development of any infrastructure is allowed; therefore, no development of associated infrastructure including access roads is allowed in the 'no-go' areas.
23. Should the specialist definition of 'no-go' area differ from the Departments definition; this must be clearly indicated. The specialist must also indicate the 'no-go' area's buffer if applicable.
24. Should the specialist studies provide more detail regarding any of the project activity thresholds, please ensure that the project activity descriptions are amended accordingly in the application form and EIAr.
25. All specialist studies must be final, and provide detailed/practical mitigation measures for the preferred alternative and recommendations, and must not recommend further studies to be completed post EA.
26. Should a specialist recommend specific mitigation measures, these must be clearly indicated.
27. Should the appointed specialists specify contradicting recommendations, the EAP must clearly indicate the most reasonable recommendation and substantiate this with defendable reasons; and were necessary, include further expertise advice.
28. Where applicable, each specialist study must provide a preferred grid connection alternative.

Layout & Sensitivity Maps

29. Please provide a layout map which indicates the following:
    a. Wind turbine positions (numbered) and its associated infrastructure;
    b. Permanent laydown area footprint;

c. Internal roads indicating width (construction period width and operation period width) and with numbered sections between the other site elements which they serve (to make commenting on sections possible);
d. Wetlands, drainage lines, rivers, stream and water crossing of roads and cables indicating the type of bridging structures that will be used;
e. The location of sensitive environmental features on site e.g. CBAs, heritage sites, wetlands, drainage lines etc. that will be affected by the facility and its associated infrastructure;
f. Substation(s) and/or transformer(s) sites including their entire footprint;
g. All existing infrastructure on the site, especially roads;
h. Buildings proposed within the substation footprint;
i. Buffer areas; and
j. All "no-go" areas.

Cumulative Assessments

30. Regarding the identified similar projects within a 30km radius of the proposed development site, the cumulative impact assessment for all identified and assessed impacts must indicate the following:
    a. Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e., hectares of cumulatively transformed land.
    b. Identified cumulative impacts associated with the proposed development must be rated with the significance rating methodology used in the process.
    c. Detailed process flow and proof must be provided, to indicate how the specialist's recommendations, mitigation measures and conclusions from the various similar developments in the area were taken into consideration in the assessment of cumulative impacts and when the conclusion and mitigation measures were drafted for this project.
    d. The cumulative impacts significance rating must also inform the need and desirability of the proposed development.
    e. A cumulative impact environmental statement on whether the proposed development must proceed.

WEF Environmental Management Programme (EMPr)

31. A construction and operational phase EMPr for the WEF, which includes mitigation and monitoring measures must be submitted with the EIAr.
32. The EMPr must be developed in terms of Appendix 4 of the EIA Regulations, 2014 as amended and must include (but not limited to) the following plans and measures:
    a. A Re-vegetation and habitat rehabilitation plan to be implemented during the construction and operation of the facility. Restoration must be undertaken as soon as possible after completion of construction activities to reduce the amount of habitat converted at any one time and to speed up the recovery to natural habitats;
    b. A Weed and invader plant management plan, to be implemented during construction and operation of the facility. The plan must include mitigation measures to reduce the invasion of alien species and ensure that the continuous monitoring and removal of alien species is undertaken;
    c. A Plant rescue and protection plan, which allows for the maximum transplant of conservation important species from areas to be transformed. This plan must be compiled by a vegetation specialist familiar with the site and be implemented prior to commencement of the construction phase;

d. An Open space management plan, to be implemented during the construction and operation of the facility;
e. A Traffic management plan for the site access roads to ensure that no hazards would result from the increased truck traffic and that traffic flow would not be adversely impacted. This plan must include measures to minimize impacts on local commuters e.g. limiting construction vehicles travelling on public roadways during the morning and late afternoon commute time and avoid using roads through densely populated built-up areas so as not to disturb existing retail and commercial operations;
f. A Transportation plan for the transport of components, main assembly cranes and other large pieces of equipment;
g. A Stormwater management plan, to be implemented during the construction and operation of the facility. The plan must ensure compliance with applicable regulations and prevent off-site migration of contaminated storm water or increased soil erosion. The plan must include the construction of appropriate design measures that allow surface and subsurface movement of water along drainage lines so as not to impede natural surface and subsurface flows. Drainage measures must promote the dissipation of storm water run-off;
h. A Fire management plan to be implemented during the construction and operation of the facility;
i. An Erosion management plan for monitoring and rehabilitating erosion events associated with the facility. Appropriate erosion mitigation must form part of this plan to prevent and reduce the risk of any potential erosion;
j. An effective monitoring system to detect any leakage or spillage of all hazardous substances during their transportation, handling, use and storage. This must include precautionary measures to limit the possibility of oil and other toxic liquids from entering the soil or storm water systems;
k. Measures to protect hydrological features such as streams, rivers, pans, wetlands, dams and their catchments, and other environmental sensitive areas from construction impacts including the direct or indirect spillage of pollutants;
l. Dust management measures;
m. Waste management measures;
n. Emergency response; and,
o. All recommendations and mitigation measures recorded in the EIAr and the specialist studies conducted. This includes the management and monitoring plans and procedures appended in the specialist studies.

33. The decommissioning chapter of the EMPr for the facility must contain information relating to the handling, repurposing or disposal of dysfunctional, severely damaged batteries, module and containers.
34. The EMPr must distinguish between impact management actions and impact management outcomes.
35. The EMPr must not contain any ambiguity. Where applicable, statements containing the word "should" or "may" are to be amended to "must".

Generic Environmental Management Programme (EMPr)

36. The proposed development triggers Activity 11 of Listing Notice 1 (as amended). The relevant generic EMPr(s) must be included in the EIAr, over and above the EMPr for the WEF.
37. Part B: Section 2 of the generic EMPr(s) must be completed, and a copy of the signed EMPr(s) must be submitted with the EIAr. Please note that Point 7.1.1 in Part B: Section 2 needs to match the

details of the applicant as contained in the application form. The generic EMPr(s) must be signed by the applicant and submitted with the EIAr. An unsigned Generic EMPr is regarded as incomplete.

38. If any specific environmental sensitivities/attributes are present on the site which require more specific impact management outcomes and impact management actions, not included in the pre-approved generic EMPr template, to manage impacts, those impact management outcomes and actions must be included in Part C of the generic EMPr.

General

The EAP must provide detailed motivation if any of the above requirements are not required by the proposed development and will not be included in the EMPr.

The applicant is hereby reminded to comply with the requirements of Regulation 45 of GN R982 of 04 December 2014, as amendment, with regard to the time period allowed for complying with the requirements of the Regulations.

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an environmental authorisation being granted by the Department.

Yours faithfully

PER E-MAIL

Dear Ms Gopaul

ACCEPTANCE OF THE SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE ROCHDALE WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The final Scoping Report (SR) and the Plan of Study for Environmental Impact Assessment (PoSEIA) dated October 2024 and received by the Department on 07 October 2024, refers.

The Department has evaluated the submitted final SR and the Plan of Study for Environmental Impact Assessment dated July 2024 and is satisfied that the documents comply with the minimum requirements of the Environmental Impact Assessment (EIA) Regulations, 2014, as amended. The FSR is hereby accepted by the Department in terms of Regulation 22(a) of the EIA Regulations, 2014, as amended.

You may proceed with the environmental impact assessment process in accordance with the tasks contemplated in the PoSEIA as required in terms of the EIA Regulations, 2014, as amended. The Environmental Impact Assessment Report (EIAr) must comply with the requirements of Appendix 3 of the EIA Regulations, 2014, as amended.

In addition, the following amendments and additional information are required for the EIAr:

The processing of personal information by the Department of Forestry, Fisheries and the Environment is done lawfully and not excessive to the purpose of processing in compliance with the POPI Act, any codes of conduct issued by the Information Regulator in terms of the POPI Act and / or relevant legislation providing appropriate security safeguards for the processing of personal information of others.

General Comments

1. The meeting minutes in Appendix F of the Public Participation Report refers. The discussions during the meeting with the Mpumalanga Department of Agriculture, Rural Development, Land and Environmental Affairs (DARDLEA) and the Mpumalanga Tourism & Parks Agency (MTPA) on 11 September 2024 are noted.
2. The table of coordinates on page *x* of the SR is noted. The EIAr must include:
   a. The corner coordinates for the Battery Energy Storage System.
   b. Bend point coordinates for the 132kV powerline alternatives; and the main access roads.
3. The EIAr must include the approximate length of each grid connection alternative route, and these grid connection routes must be discussed in the "*Alternatives*" section of the EIAr.
4. You are requested to provide the estimated operational lifespan of the proposed Rochdale WEF and details of future plans for the site and infrastructure after decommissioning, as well as the possibility of upgrading the proposed infrastructure to more advanced technologies.
5. The EIAr must confirm the availability of services identified on pages 95 to 97 of the final SR.
6. If the EIAr contains listed activities and/or other information that differs from the application form, the application form must be amended accordingly and submitted to the Department with the EIAr.

Battery Energy Storage System (BESS)

7. Applicable BESS technologies must be included under the Technology Alternatives section of the EIAr.
8. A risk assessment study is not required for the Battery Energy Storage System (BESS), however, impacts associated with the risks must be identified, considered, and assessed as part of the EIAr.

Public Participation

9. Comments on the draft EIAR must be obtained from this Department's Biodiversity Conservation Directorate at BCAdmin@dffe.gov.za and Protected Areas section (regarding the NPAES) at Tnethononda@dffe.gov.za. Further to that, these comments must be addressed and incorporated in the final EIAr.
10. Proof of correspondence with the various stakeholders must be included in the EIAr. This must indicate that this draft EIAr has been subjected to 30 days public participation process, stating the start and end date of the PPP.
11. Please ensure that comments from all relevant stakeholders are submitted to the Department with the EIAr.
12. Should you be unable to obtain comments, proof should be submitted to the Department of the attempts that were made to obtain comments. Please provide proof of written notice for the availability of the draft EIAr for comment.
13. All issues raised and comments received must be incorporated into the Comments and Response Report (CRR).
14. Comments from I&APs must not be split and arranged into categories. Comments from each submission must be responded to individually.
15. Please refrain from summarising comments made by I&APs. All comments from I&APs must be copied verbatim and responded to clearly. Please note that a response such as "noted" is not regarded as an adequate response to an I&AP's comments.
16. The CRR addresses comments on the draft SR, which have been received from organs of state, however, copies of these comments are not included in the report. Copies of original comments

received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity must be submitted to the Department with the EIAr.

17. If applicable, the attendance registers and minutes of any meetings held by the Environmental Assessment Practitioner (EAP) with Interested and Affected Parties (I&APs) and other role players must be included in the EIAr.
18. The newspaper advert proof in Appendix C of the Public Participation Report refers. Please submit a full page of the newspaper(s) containing the advertisement, ensuring that the name of the newspaper and date are visible.

Specialist assessments

19. Interim and final comments from the South African Heritage Resources Agency (SAHRA) must be addressed and incorporated in the EIAr.
20. Specialist assessments must be conducted in accordance with the Government Notice No. 320 of 20 March 2020 (i.e. "the Protocols"), and Government Notice No. 1150 of 30 October 2020 (i.e. protocols for terrestrial plant and animal species).
21. The following specialist studies will form part of the EIAr as indicated in Section 12.6 of the FSR:
    a. Soil and Agriculture Potential Impact Assessment;
    b. Noise Impact Assessment;
    c. Freshwater and Wetlands (Aquatics) Impact Assessment;
    d. Terrestrial Biodiversity (Flora and Fauna) Impact Assessment;
    e. Avifauna Impact Assessment;
    f. Bat Impact Assessment;
    g. Socio-economic Impact Assessment;
    h. Heritage, Archaeology and Palaeontology Impact Assessment;
    i. Visual / Landscape and Flicker Impact Assessment; and
    j. Traffic and Transportation Impact Assessment.
22. Please note that the Department considers a 'no-go' area, as an area where no development of any infrastructure is allowed; therefore, no development of associated infrastructure including access roads is allowed in the 'no-go' areas.
23. Should the specialist definition of 'no-go' area differ from the Departments definition; this must be clearly indicated. The specialist must also indicate the 'no-go' area's buffer if applicable.
24. Should the specialist studies provide more detail regarding any of the project activity thresholds, please ensure that the project activity descriptions are amended accordingly in the application form and EIAr.
25. All specialist studies must be final, and provide detailed/practical mitigation measures for the preferred alternative and recommendations, and must not recommend further studies to be completed post EA.
26. Should a specialist recommend specific mitigation measures, these must be clearly indicated.
27. Should the appointed specialists specify contradicting recommendations, the EAP must clearly indicate the most reasonable recommendation and substantiate this with defendable reasons; and were necessary, include further expertise advice.
28. Where applicable, each specialist study must provide a preferred grid connection alternative.

Layout & Sensitivity Maps

29. Please provide a layout map which indicates the following:
    a. Wind turbine positions (numbered) and its associated infrastructure;

b. Permanent laydown area footprint;
c. Internal roads indicating width (construction period width and operation period width) and with numbered sections between the other site elements which they serve (to make commenting on sections possible);
d. Wetlands, drainage lines, rivers, stream and water crossing of roads and cables indicating the type of bridging structures that will be used;
e. The location of sensitive environmental features on site e.g. CBAs, heritage sites, wetlands, drainage lines etc. that will be affected by the facility and its associated infrastructure;
f. Substation(s) and/or transformer(s) sites including their entire footprint;
g. All existing infrastructure on the site, especially roads;
h. Buildings proposed within the substation footprint;
i. Buffer areas; and
j. All "no-go" areas.

Cumulative Assessments

30. Regarding the identified similar projects within a 30km radius of the proposed development site, the cumulative impact assessment for all identified and assessed impacts must indicate the following:
    a. Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e., hectares of cumulatively transformed land.
    b. Identified cumulative impacts associated with the proposed development must be rated with the significance rating methodology used in the process.
    c. Detailed process flow and proof must be provided, to indicate how the specialist's recommendations, mitigation measures and conclusions from the various similar developments in the area were taken into consideration in the assessment of cumulative impacts and when the conclusion and mitigation measures were drafted for this project.
    d. The cumulative impacts significance rating must also inform the need and desirability of the proposed development.
    e. A cumulative impact environmental statement on whether the proposed development must proceed.

WEF Environmental Management Programme (EMPr)

31. A construction and operational phase EMPr for the WEF, which includes mitigation and monitoring measures must be submitted with the EIAr.
32. The EMPr must be developed in terms of Appendix 4 of the EIA Regulations, 2014 as amended and must include (but not limited to) the following plans and measures:
    a. A Re-vegetation and habitat rehabilitation plan to be implemented during the construction and operation of the facility. Restoration must be undertaken as soon as possible after completion of construction activities to reduce the amount of habitat converted at any one time and to speed up the recovery to natural habitats;
    b. A Weed and invader plant management plan, to be implemented during construction and operation of the facility. The plan must include mitigation measures to reduce the invasion of alien species and ensure that the continuous monitoring and removal of alien species is undertaken;
    c. A Plant rescue and protection plan, which allows for the maximum transplant of conservation important species from areas to be transformed. This plan must be compiled by a vegetation

specialist familiar with the site and be implemented prior to commencement of the construction phase;

d. An Open space management plan, to be implemented during the construction and operation of the facility;
e. A Traffic management plan for the site access roads to ensure that no hazards would result from the increased truck traffic and that traffic flow would not be adversely impacted. This plan must include measures to minimize impacts on local commuters e.g. limiting construction vehicles travelling on public roadways during the morning and late afternoon commute time and avoid using roads through densely populated built-up areas so as not to disturb existing retail and commercial operations;
f. A Transportation plan for the transport of components, main assembly cranes and other large pieces of equipment;
g. A Stormwater management plan, to be implemented during the construction and operation of the facility. The plan must ensure compliance with applicable regulations and prevent off-site migration of contaminated storm water or increased soil erosion. The plan must include the construction of appropriate design measures that allow surface and subsurface movement of water along drainage lines so as not to impede natural surface and subsurface flows. Drainage measures must promote the dissipation of storm water run-off;
h. A Fire management plan to be implemented during the construction and operation of the facility;
i. An Erosion management plan for monitoring and rehabilitating erosion events associated with the facility. Appropriate erosion mitigation must form part of this plan to prevent and reduce the risk of any potential erosion;
j. An effective monitoring system to detect any leakage or spillage of all hazardous substances during their transportation, handling, use and storage. This must include precautionary measures to limit the possibility of oil and other toxic liquids from entering the soil or storm water systems;
k. Measures to protect hydrological features such as streams, rivers, pans, wetlands, dams and their catchments, and other environmental sensitive areas from construction impacts including the direct or indirect spillage of pollutants;
l. Dust management measures;
m. Waste management measures;
n. Emergency response; and,
o. All recommendations and mitigation measures recorded in the EIAr and the specialist studies conducted. This includes the management and monitoring plans and procedures appended in the specialist studies.

33. The decommissioning chapter of the EMPr for the facility must contain information relating to the handling, repurposing or disposal of dysfunctional, severely damaged batteries, module and containers.
34. The EMPr must distinguish between impact management actions and impact management outcomes.
35. The EMPr must not contain any ambiguity. Where applicable, statements containing the word “should” or “may” are to be amended to “must”.

Generic Environmental Management Programme (EMPr)

36. The proposed development triggers Activity 11 of Listing Notice 1 (as amended). The relevant generic EMPr(s) must be included in the EIAr, over and above the EMPr for the WEF.

37. Part B: Section 2 of the generic EMPr(s) must be completed, and a copy of the signed EMPr(s) must be submitted with the EIAr. Please note that Point 7.1.1 in Part B: Section 2 needs to match the details of the applicant as contained in the application form. The generic EMPr(s) must be signed by the applicant and submitted with the EIAr. An unsigned Generic EMPr is regarded as incomplete.
38. If any specific environmental sensitivities/attributes are present on the site which require more specific impact management outcomes and impact management actions, not included in the pre-approved generic EMPr template, to manage impacts, those impact management outcomes and actions must be included in Part C of the generic EMPr.

General

The EAP must provide detailed motivation if any of the above requirements are not required by the proposed development and will not be included in the EMPr.

The applicant is hereby reminded to comply with the requirements of Regulation 45 of GN R982 of 04 December 2014, as amendment, with regard to the time period allowed for complying with the requirements of the Regulations.

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an environmental authorisation being granted by the Department.

Yours faithfully

Dear Ms Gopaul

ACCEPTANCE OF THE SCOPING REPORT FOR THE PROPOSED DEVELOPMENT OF THE SHEEPMOOR WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, MPUMALANGA PROVINCE

The final Scoping Report (SR) and the Plan of Study for Environmental Impact Assessment (PoSEIA) dated October 2024 and received by the Department on 07 October 2024, refers.

The Department has evaluated the submitted final SR and the Plan of Study for Environmental Impact Assessment dated July 2024 and is satisfied that the documents comply with the minimum requirements of the Environmental Impact Assessment (EIA) Regulations, 2014, as amended. The FSR is hereby accepted by the Department in terms of Regulation 22(a) of the EIA Regulations, 2014, as amended.

You may proceed with the environmental impact assessment process in accordance with the tasks contemplated in the PoSEIA as required in terms of the EIA Regulations, 2014, as amended. The Environmental Impact Assessment Report (EIAr) must comply with the requirements of Appendix 3 of the EIA Regulations, 2014, as amended.

In addition, the following amendments and additional information are required for the EIAr:

The processing of personal information by the Department of Forestry, Fisheries and the Environment is done lawfully and not excessive to the purpose of processing in compliance with the POPI Act, any codes of conduct issued by the Information Regulator in terms of the POPI Act and / or relevant legislation providing appropriate security safeguards for the processing of personal information of others.

General Comments

1. The meeting minutes in Appendix F of the Public Participation Report refers. The discussions during the meeting with the Mpumalanga Department of Agriculture, Rural Development, Land and Environmental Affairs (DARDLEA) and the Mpumalanga Tourism & Parks Agency (MTPA) on 11 September 2024 are noted.
2. The table of coordinates on page *x* of the SR is noted. The EIAr must include:
   a. The corner coordinates for the Battery Energy Storage System.
   b. Bend point coordinates for the 132kV powerline alternatives; and the main access roads.
3. The EIAr must include the approximate length of each grid connection alternative route, and these grid connection routes must be discussed in the "*Alternatives*" section of the EIAr.
4. You are requested to provide the estimated operational lifespan of the proposed Sheepmoor WEF and details of future plans for the site and infrastructure after decommissioning, as well as the possibility of upgrading the proposed infrastructure to more advanced technologies.
5. The EIAr must confirm the availability of services identified on pages 104 to 106 of the final SR.
6. If the EIAr contains listed activities and/or other information that differs from the application form, the application form must be amended accordingly and submitted to the Department with the EIAr.

Battery Energy Storage System (BESS)

7. Applicable BESS technologies must be included under the Technology Alternatives section of the EIAr.
8. A risk assessment study is not required for the Battery Energy Storage System (BESS), however, impacts associated with the risks must be identified, considered, and assessed as part of the EIAr.

Public Participation

9. Comments on the draft EIAR must be obtained from this Department's Biodiversity Conservation Directorate at BCAdmin@dffe.gov.za and Protected Areas section (regarding the NPAES) at Tnethononda@dffe.gov.za. Further to that, these comments must be addressed and incorporated in the final EIAr.
10. Proof of correspondence with the various stakeholders must be included in the EIAr. This must indicate that this draft EIAr has been subjected to 30 days public participation process, stating the start and end date of the PPP.
11. Please ensure that comments from all relevant stakeholders are submitted to the Department with the EIAr.
12. Should you be unable to obtain comments, proof should be submitted to the Department of the attempts that were made to obtain comments. Please provide proof of written notice for the availability of the draft EIAr for comment.
13. All issues raised and comments received must be incorporated into the Comments and Response Report (CRR).
14. Comments from I&APs must not be split and arranged into categories. Comments from each submission must be responded to individually.
15. Please refrain from summarising comments made by I&APs. All comments from I&APs must be copied verbatim and responded to clearly. Please note that a response such as "noted" is not regarded as an adequate response to an I&AP's comments.
16. The CRR addresses comments on the draft SR, which have been received from organs of state, however, copies of these comments are not included in the report. Copies of original comments

received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity must be submitted to the Department with the EIAr.

17. If applicable, the attendance registers and minutes of any meetings held by the Environmental Assessment Practitioner (EAP) with Interested and Affected Parties (I&APs) and other role players must be included in the EIAr.
18. The newspaper advert proof in Appendix C of the Public Participation Report refers. Please submit a full page of the newspaper(s) containing the advertisement, ensuring that the name of the newspaper and date are visible.

Specialist assessments

19. Interim and final comments from the South African Heritage Resources Agency (SAHRA) must be addressed and incorporated in the EIAr.
20. Specialist assessments must be conducted in accordance with the Government Notice No. 320 of 20 March 2020 (i.e. "the Protocols"), and Government Notice No. 1150 of 30 October 2020 (i.e. protocols for terrestrial plant and animal species).
21. The following specialist studies will form part of the EIAr as indicated in Section 12.6 of the FSR:
    a. Soil and Agriculture Potential Impact Assessment;
    b. Aquatic Impact Assessment;
    c. Terrestrial Biodiversity (Flora and Fauna) Impact Assessment;
    d. Avifauna Impact Assessment;
    e. Bat Impact Assessment;
    f. Visual / Landscape and Flicker Impact Assessment;
    g. Heritage, Archaeology and Palaeontology Impact Assessment;
    h. Noise Impact Assessment;
    i. Socio-economic Impact Assessment; and
    j. Traffic and Transportation Impact Assessment.
22. Please note that the Department considers a 'no-go' area, as an area where no development of any infrastructure is allowed; therefore, no development of associated infrastructure including access roads is allowed in the 'no-go' areas.
23. Should the specialist definition of 'no-go' area differ from the Departments definition; this must be clearly indicated. The specialist must also indicate the 'no-go' area's buffer if applicable.
24. Should the specialist studies provide more detail regarding any of the project activity thresholds, please ensure that the project activity descriptions are amended accordingly in the application form and EIAr.
25. All specialist studies must be final, and provide detailed/practical mitigation measures for the preferred alternative and recommendations, and must not recommend further studies to be completed post EA.
26. Should a specialist recommend specific mitigation measures, these must be clearly indicated.
27. Should the appointed specialists specify contradicting recommendations, the EAP must clearly indicate the most reasonable recommendation and substantiate this with defendable reasons; and were necessary, include further expertise advice.
28. Where applicable, each specialist study must provide a preferred grid connection alternative.

Layout & Sensitivity Maps

29. Please provide a layout map which indicates the following:
    a. Wind turbine positions (numbered) and its associated infrastructure;

b. Permanent laydown area footprint;
c. Internal roads indicating width (construction period width and operation period width) and with numbered sections between the other site elements which they serve (to make commenting on sections possible);
d. Wetlands, drainage lines, rivers, stream and water crossing of roads and cables indicating the type of bridging structures that will be used;
e. The location of sensitive environmental features on site e.g. CBAs, heritage sites, wetlands, drainage lines etc. that will be affected by the facility and its associated infrastructure;
f. Substation(s) and/or transformer(s) sites including their entire footprint;
g. All existing infrastructure on the site, especially roads;
h. Buildings proposed within the substation footprint;
i. Buffer areas; and
j. All "no-go" areas.

Cumulative Assessments

30. Regarding the identified similar projects within a 30km radius of the proposed development site, the cumulative impact assessment for all identified and assessed impacts must indicate the following:
    a. Identified cumulative impacts must be clearly defined, and where possible the size of the identified impact must be quantified and indicated, i.e., hectares of cumulatively transformed land.
    b. Identified cumulative impacts associated with the proposed development must be rated with the significance rating methodology used in the process.
    c. Detailed process flow and proof must be provided, to indicate how the specialist's recommendations, mitigation measures and conclusions from the various similar developments in the area were taken into consideration in the assessment of cumulative impacts and when the conclusion and mitigation measures were drafted for this project.
    d. The cumulative impacts significance rating must also inform the need and desirability of the proposed development.
    e. A cumulative impact environmental statement on whether the proposed development must proceed.

WEF Environmental Management Programme (EMPr)

31. A construction and operational phase EMPr for the WEF, which includes mitigation and monitoring measures must be submitted with the EIAr.
32. The EMPr must be developed in terms of Appendix 4 of the EIA Regulations, 2014 as amended and must include (but not limited to) the following plans and measures:
    a. A Re-vegetation and habitat rehabilitation plan to be implemented during the construction and operation of the facility. Restoration must be undertaken as soon as possible after completion of construction activities to reduce the amount of habitat converted at any one time and to speed up the recovery to natural habitats;
    b. A Weed and invader plant management plan, to be implemented during construction and operation of the facility. The plan must include mitigation measures to reduce the invasion of alien species and ensure that the continuous monitoring and removal of alien species is undertaken;
    c. A Plant rescue and protection plan, which allows for the maximum transplant of conservation important species from areas to be transformed. This plan must be compiled by a vegetation

specialist familiar with the site and be implemented prior to commencement of the construction phase;

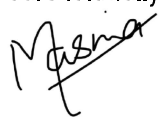
d. An Open space management plan, to be implemented during the construction and operation of the facility;
e. A Traffic management plan for the site access roads to ensure that no hazards would result from the increased truck traffic and that traffic flow would not be adversely impacted. This plan must include measures to minimize impacts on local commuters e.g. limiting construction vehicles travelling on public roadways during the morning and late afternoon commute time and avoid using roads through densely populated built-up areas so as not to disturb existing retail and commercial operations;
f. A Transportation plan for the transport of components, main assembly cranes and other large pieces of equipment;
g. A Stormwater management plan, to be implemented during the construction and operation of the facility. The plan must ensure compliance with applicable regulations and prevent off-site migration of contaminated storm water or increased soil erosion. The plan must include the construction of appropriate design measures that allow surface and subsurface movement of water along drainage lines so as not to impede natural surface and subsurface flows. Drainage measures must promote the dissipation of storm water run-off;
h. A Fire management plan to be implemented during the construction and operation of the facility;
i. An Erosion management plan for monitoring and rehabilitating erosion events associated with the facility. Appropriate erosion mitigation must form part of this plan to prevent and reduce the risk of any potential erosion;
j. An effective monitoring system to detect any leakage or spillage of all hazardous substances during their transportation, handling, use and storage. This must include precautionary measures to limit the possibility of oil and other toxic liquids from entering the soil or storm water systems;
k. Measures to protect hydrological features such as streams, rivers, pans, wetlands, dams and their catchments, and other environmental sensitive areas from construction impacts including the direct or indirect spillage of pollutants;
l. Dust management measures;
m. Waste management measures;
n. Emergency response; and,
o. All recommendations and mitigation measures recorded in the EIAr and the specialist studies conducted. This includes the management and monitoring plans and procedures appended in the specialist studies.

33. The decommissioning chapter of the EMPr for the facility must contain information relating to the handling, repurposing or disposal of dysfunctional, severely damaged batteries, module and containers.
34. The EMPr must distinguish between impact management actions and impact management outcomes.
35. The EMPr must not contain any ambiguity. Where applicable, statements containing the word “should” or “may” are to be amended to “must”.

Generic Environmental Management Programme (EMPr)

36. The proposed development triggers Activity 11 of Listing Notice 1 (as amended). The relevant generic EMPr(s) must be included in the EIAr, over and above the EMPr for the WEF.

37. Part B: Section 2 of the generic EMPr(s) must be completed, and a copy of the signed EMPr(s) must be submitted with the EIAr. Please note that Point 7.1.1 in Part B: Section 2 needs to match the details of the applicant as contained in the application form. The generic EMPr(s) must be signed by the applicant and submitted with the EIAr. An unsigned Generic EMPr is regarded as incomplete.
38. If any specific environmental sensitivities/attributes are present on the site which require more specific impact management outcomes and impact management actions, not included in the pre-approved generic EMPr template, to manage impacts, those impact management outcomes and actions must be included in Part C of the generic EMPr.



General

The EAP must provide detailed motivation if any of the above requirements are not required by the proposed development and will not be included in the EMPr.

The applicant is hereby reminded to comply with the requirements of Regulation 45 of GN R982 of 04 December 2014, as amendment, with regard to the time period allowed for complying with the requirements of the Regulations.

You are hereby reminded of Section 24F of the National Environmental Management Act, Act No. 107 of 1998, as amended, that no activity may commence prior to an environmental authorisation being granted by the Department.

EXTERNAL MESSAGE

Dear AidaForm user,

Your form "Stakeholder Engagement Form" has a new response.

---

1. What's your name?
Rona Odendaal

2. Who do you represent?
Individual, a Private party

[redacted]

3. Your Address?
Athole farm, Amsterdam, Mpumalanga, 2375, South Africa

7. What is your interest in the projects?
Strongly oppose

8. Please visit the ERM website (link below) for more info and access to the reports. Are you able to access the website?
No

9. What are your comments regarding the Rochdale, Envolo and Shaepmoor WEF Cluster?
Negative impact on the environment and bird life.

10. Protection of Personal Information (POPI) Act, Act 4 of 2013
No (0)

You can turn off or manage notifications for this form at:
https://eur01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fmy.aidaform.com%2Fform%2Fmmg56gvmb8%2Fsettings%2Femail&data=05%7C02%7Cerm.arcsaamsterdam%40erm.com%7C1b8f8fc7cbc8456d8f6430fdcda6880d%7C2f1e6bd39c4a485baa69c1f822de8815%7C0%7C0%7C638625390384030816%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=MopEXdPZ%2BYG%2BtFLa2IK152ssPbyFKdp9kTcoNY9aE%3D&reserved=0

EXTERNAL MESSAGE

Dear Sir/Madam

ACKNOWLEDGEMENT OF RECEIPT OF THE REQUEST FOR AN EXTENSION IN TERMS OF REGULATION 3(7) OF THE ENVIRONMENTAL IMPACT ASSESSMENT REGULATIONS, 2014, AS AMENDED FOR THE PROPOSED DEVELOPMENT OF THE EMVELO WIND ENERGY FACILITY AND AUXILIARY INFRASTRUCTURE, NEAR ERMELO, WITHIN THE MSUKALIGWA LOCAL MUNICIPALITY, AND GERT SIBANDE DISTRICT MUNICIPALITY, MPUMALANGA PROVINCE.

The Department confirms having received the request for extension in terms of Regulation 3(7) of Environmental Impact Assessment (EIA) Regulations, 2014, as amended, for the abovementioned project on 13 February 2025.

Please note that the outcome of your request will be communicated in due course.

You are hereby reminded of Section 24F of the National Environmental Management Act 1998 (Act No. 107 of 1998), as amended, that no activity may commence prior to an Environmental Authorisation being granted by the Department.

Kind Regards,
Salome Mambane

Algunos contactos que recibieron este mensaje no suelen recibir correos electrónicos de david.nunez@siriuspower.co.za. Por qué es esto importante

EXTERNAL MESSAGE

Dear Stephanie,

I filled in the online form - kindly confirm I am registered as an I&AP and will receive further info as the EIA process evolves.

Please note:

- There is a disconnect between the declared MW size and the number of turbines:
  - Rochdale: 240MW vs. 16 WTGs @ 8MW = 128MW
  - Emvelo: 200MW vs. 36 WTGs @ 8MW = 288MW
  - Sheepmoor: 360MW vs. 22 WTGs @ 8MW = 176W
- WTG8 of Emvelo falls outside of the declared development area

Can you kindly clarify?

Thanks and regards,

DAVID NUNEZ

Subject: Notification of Submission of Final Scoping Report for the Proposed Sheepmoor, Rochdale and Emvelo WEF Cluster, Mpumalanga Province

Dear Registered Interested and Affected Party,

NOTIFICATION OF SUBMISSION OF THE FINAL SCOPING REPORT(S) FOR APPROVAL TO PROCEED TO ENVIRONMENTAL IMPACT ASSESSMENT PHASE FOR THE PROPOSED SHEEPMOOR, ROCHDALE AND EMVELO WIND ENERGY FACILITIES, MPUMALANGA PROVINCE

DFFE Reference: 14/12/16/3/3/2/2611, 14/12/16/3/3/2/2612 and 14/12/16/3/3/2/2613

This email serves to inform you about the submission of the Final Scoping Reports for the proposed Sheepmoor, Rochdale and Emvelo WEFs , in the Mpumalanga Province.

The Draft Scoping Report for the Proposed Development(s) was subjected to the required 30-day comment and review period, from the 22 August 2024 to the 21 September 2024 (both days inclusive), taking into consideration Chapter 2 Regulation 3 (1); (2) and (3) of the NEMA, 1998 (Act No. 107 of 1998). Comments received from the public were incorporated, addressed and responded to in the Final Scoping Report.

Following the 30-day public comment and review period, the Final Scoping Reports has been submitted to the Department of Forestry, Fisheries and the Environment (competent authority) for decision and is available for the public to view and download via the ERM website.

With reference to the above, please send any queries to the below address. Please also indicate the contact details of any other potential I&APs that should be contacted and registered.

Email: mailto:ERM.ArcusAmsterdam@erm.com

Die volgende het onder my aandag gekom en plaas dit net op rekord
- die drie windplase is gewysig na slegs twee
- die windturbines se plasing is wesenlik gewysig
- as I&AP is geen kennis daarvan ontvang nie
- geleentheid om kommentaar op wysiging te lewer is sodoende my ontneem
- verskeie spesialiste het intussen weer area besoek om verdere verslae op te stel. afgesien van die voelkundiges het die ander twee, waarvan ek weet, my nie gekontak nie. my kontak detail is blykbaar van hul weerhou.

EAP is ook verskeie kere al versoek vir kaart wat turbines, plaas grense en distrik paaie duidelik toon. wag nou nog.

Bogemelde prosedure is totaal gebrekkig en regsadvies word in die verband ingewin.

Subject:	Notification of Submission of Final Scoping Report for the Proposed Sheepmoor, Rochdale and Emvelo WEF Cluster, Mpumalanga Province
Date:	Thursday, 10 October 2024 13:52:23
Attachments:	image001.png

Dear Registered Interested and Affected Party,

NOTIFICATION OF SUBMISSION OF THE FINAL SCOPING REPORT(S) FOR APPROVAL TO PROCEED TO ENVIRONMENTAL IMPACT ASSESSMENT PHASE FOR THE PROPOSED SHEEPMOOR, ROCHDALE AND EMVELO WIND ENERGY FACILITIES, MPUMALANGA PROVINCE

DFFE Reference: 14/12/16/3/3/2/2611, 14/12/16/3/3/2/2612 and 14/12/16/3/3/2/2613

This email serves to inform you about the submission of the Final Scoping Reports for the proposed Sheepmoor, Rochdale and Emvelo WEFs , in the Mpumalanga Province.

The Draft Scoping Report for the Proposed Development(s) was subjected to the required 30-day comment and review period, from the 22 August 2024 to the 21 September 2024 (both days inclusive), taking into consideration Chapter 2 Regulation 3 (1); (2) and (3) of the NEMA, 1998 (Act No. 107 of 1998). Comments received from the public were incorporated, addressed and responded to in the Final Scoping Report.

Following the 30-day public comment and review period, the Final Scoping Reports has been submitted to the Department of Forestry, Fisheries and the Environment (competent authority) for decision and is available for the public to view and download via the ERM website.

With reference to the above, please send any queries to the below address. Please also indicate the contact details of any other potential I&APs that should be contacted and registered.

Email: mailto:ERM.ArcusAmsterdam@erm.com

Website: **https://www.erm.com/public-information-sites/proposed-amsterdam-wind-energy-facility-and-auxiliary-infrastructure-cluster-mpumalanga/**

Thank you for the interest in the project.

Hi Josua,

Thank you for sharing your concerns about the proposed WEF cluster. We appreciate your input. Your comments will be considered during the Environmental Impact Assessment (EIA) phase.

As part of the process, we will assess potential changes to the wind turbine layout and work to avoid sensitive areas to minimize any negative impacts. Your feedback appreciated and we will keep you updated as the EIA progresses.

Kind regards,

Thanks for your prompt response!

On a different note that is unrelated to the PPP for the Amsterdam cluster:

I have put together a database of renewable energy projects at different stages of development in South Africa based entirely on public information obtained from PPP of EIA applications. I lost track of EIA applications from your portfolio when ERM acquired Arcus and the public participation section on Arcus' website was removed, and there isn't a similar section on ERM's website (the closest I found is this site, but it is empty).

Is there a section of your website that I'm missing where I can find a list of "active" projects similar to this one? If not, is there any way I can automatically get registered as I&AP on existing and future energy projects?

Many thanks for your help

Dear Stephanie,

I filled in the online form - kindly confirm I am registered as an I&AP and will receive further info as the EIA process evolves.

Please note:

- There is a disconnect between the declared MW size and the number of turbines:
  - Rochdale: 240MW vs. 16 WTGs @ 8MW = 128MW
  - Emvelo: 200MW vs. 36 WTGs @ 8MW = 288MW
  - Sheepmoor: 360MW vs. 22 WTGs @ 8MW = 176W
- WTG8 of Emvelo falls outside of the declared development area

Can you kindly clarify?

EXTERNAL MESSAGE

Dear Lucien,

This is extremely helpful, thanks a lot

I am already registered as an I&AP for the Amsterdam cluster and for Khoe/Hugo. Can you kindly register me for Boshoek 1-3 and Koup1-2?

Thanks and regards,

DAVID NUNEZ
executive director

EXTERNAL MESSAGE

Thanks for your prompt response!

On a different note that is unrelated to the PPP for the Amsterdam cluster:

I have put together a database of renewable energy projects at different stages of development in South Africa based entirely on public information obtained from PPP of EIA applications. I lost track of EIA applications from your portfolio when ERM acquired Arcus and the public participation section on Arcus' website was removed, and there isn't a similar section on ERM's website (the closest I found is this site, but it is empty).

Is there a section of your website that I'm missing where I can find a list of "active" projects similar to this one? If not, is there any way I can automatically get registered as I&AP on existing and future energy projects?

Many thanks for your help

Dear Stephanie,

I filled in the online form - kindly confirm I am registered as an I&AP and will receive further info as the EIA process evolves.

Please note:

- There is a disconnect between the declared MW size and the number of turbines:
  - Rochdale: 240MW vs. 16 WTGs @ 8MW = 128MW
  - Emvelo: 200MW vs. 36 WTGs @ 8MW = 288MW
  - Sheepmoor: 360MW vs. 22 WTGs @ 8MW = 176W
- WTG8 of Emvelo falls outside of the declared development area

Can you kindly clarify?

Thanks and regards,

Cc: 'Lloyd Barnes' <lloyd@mulilo.com>; 'Stephen Burton' <Stephen.Burton@erm.com>
Subject: RE: Bat Specialist - Mulilo Amsterdam CA Commenting Responses required

Hi Lucien

Thanks for sharing these comments.
I agree with the board on points regarding the CBA. I have used that in my structuring of risk as per the text and table below:

To align with regional conservation and integrated development planning, the Mpumalanga Biodiversity Sector Plan Handbook (MTPA 2014) was consulted to further define spatial risk in the AoI. The intention here was to align biodiversity conservation policy objectives with renewable energy policy objectives, attempting to minimise trade-offs between conflicting goals (Jackson 2011, Gasparatos et al. 2017). The handbook includes a map of terrestrial areas that are important for conserving biodiversity and ecological processes – Critical Biodiversity Areas (CBAs) and Ecological Support Areas (ESAs) respectively. CBA Irreplaceable Areas were categorised as High Risk (Table 6) because the conservation goals for these areas are to maintain them in a natural state with no loss of ecosystems, functionality or species, and with no flexibility in land-use options (MTPA 2014). The remaining areas were assigned low or medium risk where all infrastructure development should be prioritized. These included modified land, ESA, CBA optimal, and other Natural Areas (Table 6). Although the primary objective of the CBA optimal areas is to

maintain these spaces in a natural state with no loss of ecosystems, functionality or species, some flexibility in land-use options is permitted (MTPA 2014). Similarly, in ecological supports areas (ESAs), the objective is to maintain habitats in a natural, or near-natural, state with limited loss of ecosystems or functionality. Hence, these areas were classified as medium risk, permitting the siting of turbines in these spaces. All turbines will be subjected to a post-construction bat fatality monitoring program which will monitor residual impacts at turbines located in CBA optimal and ecological support areas, as well as turbines in low-risk areas. The results of this monitoring will inform management actions where needed to ensure alignment with the MTPA objectives to limit impacts to biodiversity.

Table 6: Features used to assign spatial risk categories in the AoI for bats (Chiroptera)

Risk Level			
Low	**Medium**	**High**	**No-Go**
Heavily modified land	CBA Optimal	CBA Irreplaceable Areas	Farm Dams (200 m buffer)
Moderately modified land	ESA Landscape corridor		Wetlands (200 m buffer)
	ESA Local corridor		Houses (200 m buffer)
	Other Natural Areas		Buildings (200 m buffer)
			Rivers (200 m buffer)
			Wetlands (200 m buffer)
			Rocky Outcrops (200 m buffer)

Based on the comments, it can be argued that the CBA Irreplaceable Areas would need to be elevated to No-Go as well which I would support.

Regarding comments 8.3, 9.3 and 10.3; these assessments would be addressed in the final EIA report.

I am unable to attend the meeting on Monday. Please advise what the next steps are.

All the best

Hi Jonathan,

Kindly see attached comments from DARDLEA/MTPA pertaining to the Mulilo Amster WEF Cluster (Sheepmoor, Rochdale and Emvelo).

Please could you read through all the comments for each development. However please focus your responses on the following points per development:

Bats	Rochdale	Sheepmoor	Emvelo
Point	1, 4, 6 and 9.3	1, 6, 7, 8 and 10.3	1, 4, 5, 6 and 8.3

Ideally, we would like these comments responded to by Monday the 23rd September, please let us know if this will be an issue.

A meeting invite for today at 14h00 will be sent out shortly to discuss the above. Kindly indicate your availability to attend.

You don't often get email from grahamyounglandarch@gmail.com. Learn why this is important

EXTERNAL MESSAGE

Dear Lucien,
Upon review of the CA's comments, we've found no specific issues that relate directly to the visual assessment. We therefore have not commented.
However, their comment about cumulative impact is noted and will be addressed in the assessment phase, should the project proceed to that phase.

I have also attached our Statement for work done to date. Please note that we have not been paid for our Scoping Reports. The invoice was issued in November 2023.

Hi Gavin,

Hoping you are well. Noted on your availability to attend to these comments, however please do let me know if you are able to provide any comment before this coming Friday, it will be appreciated. Apologies for the delays in the VO – I am following up with finance.

Additionally, I just wanted to find out if you have uploaded the Heritage survey to the SAHRA via SAHRIS?

Kindest Regards,

EXTERNAL MESSAGE

Hi Lucien
Highly unlikely that I can get comments by then. It is too short notice. If they require more than a sentence and if there are many it will take longer. I have been in the field for 3 weeks and have 3 weeks to go. Will see what I can do.
We still have not been paid that VO. Can you please look into it.
Regards
Gavin

Subject: Re: Mulilo Amsterdam WEF Cluster (Sheepmoor, Rochdale and Emvelo)
Date: Monday, 23 September 2024 10:02:42

WARNING: The sender of this email could not be validated and may not match the person in the "From" field.

EXTERNAL MESSAGE

Morning

From my side no comments directly on the aquatic / wetland environment as any comments related to this field were related to the avifaunal i.e. waterbirds or buffers associated.

They have noted that some of the infrastructure is within some of the aquatic features / buffers as indicated in my reports and must be resolved in the design phase for the EIA

Thanks and regards

Brian

Subject: Notification of Submission of Final Scoping Report for the Proposed Sheepmoor, Rochdale and Emvelo WEF Cluster, Mpumalanga Province

Dear Registered Interested and Affected Party,

NOTIFICATION OF SUBMISSION OF THE FINAL SCOPING REPORT(S) FOR APPROVAL TO PROCEED TO ENVIRONMENTAL IMPACT ASSESSMENT PHASE FOR THE PROPOSED SHEEPMOOR, ROCHDALE AND EMVELO WIND ENERGY FACILITIES, MPUMALANGA PROVINCE

DFFE Reference: 14/12/16/3/3/2/2611, 14/12/16/3/3/2/2612 and 14/12/16/3/3/2/2613

This email serves to inform you about the submission of the Final Scoping Reports for the proposed Sheepmoor, Rochdale and Emvelo WEFs , in the Mpumalanga Province.

The Draft Scoping Report for the Proposed Development(s) was subjected to the required 30-day comment and review period, from the 22 August 2024 to the 21 September 2024 (both days inclusive), taking into consideration Chapter 2 Regulation 3 (1); (2) and (3) of the NEMA, 1998 (Act No. 107 of 1998). Comments received from the public were incorporated, addressed and responded to in the Final Scoping Report.

Following the 30-day public comment and review period, the Final Scoping Reports has been submitted to the Department of Forestry, Fisheries and the Environment (competent authority) for decision and is available for the public to view and download via the ERM website.

With reference to the above, please send any queries to the below address. Please also indicate the contact details of any other potential I&APs that should be contacted and registered.

This email serves to inform you about the submission of the Final Scoping Reports for the proposed Sheepmoor, Rochdale and Emvelo WEFs , in the Mpumalanga Province.

The Draft Scoping Report for the Proposed Development(s) was subjected to the required 30-day comment and review period, from the 22 August 2024 to the 21 September 2024 (both days inclusive), taking into consideration Chapter 2 Regulation 3 (1); (2) and (3) of the NEMA, 1998 (Act No. 107 of 1998). Comments received from the public were incorporated, addressed and responded to in the Final Scoping Report.

Following the 30-day public comment and review period, the Final Scoping Reports has been submitted to the Department of Forestry, Fisheries and the Environment (competent authority) for decision and is available for the public to view and download via the ERM website.

With reference to the above, please send any queries to the below address. Please also indicate the contact details of any other potential I&APs that should be contacted and registered.

EXTERNAL MESSAGE

Good day

What is the next step in the EIA phase for the above proposed three windfarms?

Where can the public comments, the address and response to that been seen?

Has the health risk and distance from occupied dwellings according to international standards and law been investigated and addressed?

Are there still public meetings to follow?

Can you please forward the procedure that is still to come?

Regards

Subject: Re: Terrestrial Biodiversity + Faunal Specialist - Mulilo Amsterdam CA Commenting Responses required
Date: Thursday, 26 September 2024 08:18:52
Attachments: image001.png

EXTERNAL MESSAGE

Hi Lucien

Sorry we could not attend the meeting - we've been busy with field work and Callan is still away in Australia.

I had a quick look at the comments - most seem related to the avifaunal theme and there appear to be no direct comments related to the faunal theme and animal SCC we assessed.

The general comment about the importance of intact grassland patches and CBAs: In this regard, we had considered intact grassland habitat and CBAs to classify our constraints map in terms of faunal sensitivity.

Once turbine placement and associated roads and other infrastructure are finalized, then one can better assess the site sensitivity of these specific areas and if any ecological processes may be impacted in relation to the animal theme and flagged animal SCC.

Best regards
Jonathan (and Callan)

tanialtenning wasn't found at emtshaded.co.za, or the mailbox is unavailable.

ERM.ArcusAmsterdam Office 365 tanialtenning
Action Required Recipient

Unknown To address

How to Fix It
The email address might be misspelled or it might not exist. Try one or more of the following:
* Retype the recipient's address, then resend the message - If you're using Outlook, open this non-delivery report message and click Send Again from the menu or ribbon. In Outlook on the web, select this message, and then click the "To send this message again, click here." link located just above the message preview window. In the To or Cc line, delete and then retype the entire recipient's address (ignore any address suggestions). After typing the complete address, click Send to resend the message. If you're using an email program other than Outlook or Outlook on the web, follow its standard way for resending a message. Just be sure to delete and retype the recipient's entire address before resending it.
* Remove the recipient from the recipient Auto-Complete List, then resend the message - If you're using Outlook or Outlook on the web, follow the steps in the "Remove the recipient from the recipient Auto-Complete List" section of this article: <https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fsupport.microsoft.com%2Fen-us%2Fhelp%2F2032697%2Fremove-an-entry-from-the-auto-complete-list&data=yg4MTIzMzIzMjM4NzAwMzAwMC4ArcusAmsterdam%40erm.com%7Cc5cdfe01c5d34f132456f6dce9220102%7C2f6e6bd39c4e485ba69fa1802ba8813f%7C0%7C0%7C638641579477232795%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=ygTHZ5ZBDQkRRzCdZnNv3HD5SZI%2Fhodcfxw%2BWRA%3D&reserved=0>. Then resend the message. Be sure to delete and retype the recipient's entire address before clicking Send.
* Contact the recipient by some other means, (by phone, for example) to confirm you're using the right address. Ask them if they've set up an email forwarding rule that could be forwarding your message to an incorrect address.
If the problem continues, forward this message to your email admin. If you're an email admin, refer to the More Info for Email Admins section below.

Mem Info for Email Admins
Status code: 550 5.1.351
When Office 365 tried to send the message, the external email server returned an error stating that the recipient is unknown or the mailbox is unavailable. This error was reported by an email server outside Office 365.
If you or the sender can't fix the problem, contact the responsible party's email admin - Give them the error code and error message from this non-delivery report (NDR) to help them troubleshoot the issue. To determine who the responsible party might be, check the error for information about where the problem is happening. For example, look for a domain name like contoso.com. A domain name in the error might suggest who is responsible for the error. It could be the recipient's email server, or it could be a third-party service that your organization or the recipient's organization is using to process or filter email messages.
Although the sender might be able to fix the issue by correcting the recipient address, it's likely that only the recipient's email admin can fix the problem. Unfortunately, it's unlikely Office 365 Support will be able to help with these kinds of externally reported errors.

Action Required Recipient

Unknown To address

How to Fix It
The email address might be misspelled or it might not exist. Try one or more of the following:
* Retype the recipient's address, then resend the message - If you're using Outlook, open this non-delivery report message and click Send Again from the menu or ribbon. In Outlook on the web, select this message, and then click the "To send this message again, click here." link located just above the message preview window. In the To or Cc line, delete and then retype the entire recipient's address (ignore any address suggestions). After typing the complete address, click Send to resend the message. If you're using a program other than Outlook or Outlook on the web, follow its standard way for resending a message. Just be sure to delete and retype the recipient's entire address before resending it.
* Remove the recipient from the recipient Auto-Complete List, then resend the message - If you're using Outlook or Outlook on the web, follow the steps in the "Remove the recipient from the recipient Auto-Complete List" section of this article.<https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D532972&data=05%7C02%7CERM.AccraAmsterdam%40erm.com%7C06f95fa0fb3f2444c778408da5922f1405%7C2fc6fbd39c4a485ba6fe1f82ba801305%7C0%7C0%7C638641579456103595%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=3mXHK0EIjnM1oyygSZgfRXxBFYJeOuojrnXcZ%2B6eA%3D&reserved=0> . Then resend the message. Be sure to delete and retype the recipient's entire address before clicking Send.
* Contact the recipient by some other means, (by phone, for example) to confirm you're using the right address. Ask them if they've set up an email forwarding rule that could be forwarding your message to an incorrect address.
If the problem continues, forward this message to your email admin. If you're an email admin, refer to the More Info for Email Admins section below.

More Info for Email Admins
Status code: 550 5.1.351
When Office 365 tried to send the message, the external email server returned an error stating that the recipient is unknown or the mailbox is unavailable. This error was reported by an email server outside Office 365.
If you or the sender can't fix the problem, contact the responsible party's email admin - Give them the error code and error message from this non-delivery report (NDR) to help them troubleshoot the issue. To determine who the responsible party might be, check the error for information about where the problem is happening. For example, look for a domain name like contoso.com. A domain name in the error might suggest who is responsible for the error. It could be the recipient's email server, or it could be a third-party service that your organization or the recipient's organization is using to process or filter email messages.
Although the sender might be able to fix the issue by correcting the recipient address, it's likely that only the recipient's email admin can fix the problem. Unfortunately, it's unlikely Office 365 Support will be able to help with these kinds of externally reported errors.

ERM.AreasAmsterdam Office 365 jscherter
Action Required Recipient

Unknown To address

How to Fix It
The address may be misspelled or may not exist. Try one or more of the following:
* Send the message again following these steps: In Outlook, open this non-delivery report (NDR) and choose Send Again from the Report ribbon. In Outlook on the web, select this NDR, then select the link "To send this message again, click here." Then delete and retype the entire recipient address. If prompted with an Auto-Complete List suggestion don't select it. After typing the complete address, click Send.
* Contact the recipient (by phone, for example) to check that the address exists and is correct.
* The recipient may have set up email forwarding to an incorrect address. Ask them to check that any forwarding they've set up is working correctly.
* Clear the recipient Auto-Complete List in Outlook or Outlook on the web by following the steps in this article: Fix email delivery issues for error code 5.1.1 in Office 365 <https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D559268&data=05%7C02%7CERM.AreasAmsterdam%40erm.com%7C3c4544b84532384fbf1260bdced2200c%7C1f2e6bd39c4a485bae6c1682ba8b1305%7C0%7C0%7C638641579490474379%7CUnknown%7CTWFpbGZsb3dpdzIjb2lqMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=pLHIEM01JDpoFo4X89Wjqfd2Dxjfq1iCWECqs808U2%3D&reserved=0>

More Info for Email Admins
Status code: 550 5.1.1
This error occurs because the sender sent a message to an email address outside of Office 365, but the address is incorrect or doesn't exist at the destination domain. The error is reported by the recipient domain's email server, but most often it must be fixed by the person who sent the message. If the steps in the How to Fix It section above don't fix the problem, and you're the email admin for the recipient, try one or more of the following:
The email address exists and is correct - Confirm that the recipient address exists, is correct, and is accepting messages.
Synchronize your directories - If you have a hybrid environment and are using directory synchronization make sure the recipient's email address is synced correctly in both Office 365 and in your on-premises directory.
Errant forwarding rule - Check for forwarding rules that aren't behaving as expected. Forwarding can be set up by an admin via mail flow rules or mailbox forwarding address settings, or by the recipient via the Inbox Rules feature.
Mail flow settings and MX records are not correct - Misconfigured mail flow or MX record settings can cause this error. Check your Office 365 mail flow settings to make sure your domain and any mail flow connectors are set up correctly. Also, work with your domain registrar to make sure the MX records for your domain are configured correctly.
For more information and additional tips to fix this issue, see Fix email delivery issues for error code 550 5.1.1 in Office 365 <https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D559268&data=05%7C02%7CERM.AreasAmsterdam%40erm.com%7C3c4544b84532384fbf1260bdced2200c%7C1f2e6bd39c4a485bae6c1682ba8b1305%7C0%7C0%7C638641579490474379%7CUnknown%7CTWFpbGZsb3dpdzIjb2lqMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=6EgwVdZSNScC1hEkXnnbmIxKvpwcN91r%2FrGZOSIBc%3D&reserved=0>

Action Required Recipient

Unknown To address

How to Fix It
The address might be misspelled or might not exist. Try one or more of the following:
* Retype the recipient's address, then resend the message - If you're using Outlook, open this non-delivery report message and click Send Again from the menu or ribbon. In Outlook on the web, select this message, and then click the "To send this message again, click here." link located just above the message preview window. In the To or Cc line, delete and then retype the entire recipient's address (ignore any address suggestions). After typing the complete address, click Send to resend the message. If the recipient's address is still incorrect, contact the recipient by another method to confirm the correct address.
* Remove the recipient from the recipient Auto-Complete List, then resend the message - If you're using Outlook or Outlook on the web, edit the recipient's address from the Auto-Complete List* section of this article: <https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D532972&data=05%7C02%7CERM.AreasAmsterdam%40erm.com%7Ca4f6e2fc7db04912377f8dce922bdb8%7C2fdeb8d39c4e4485ba69c1882ba88138%7C0%7C0%7C638661759015173%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C%7C%7C&sdata=a7YdkJQhdf5ueXQWv1o9tNYQEiCQo5UEkIL%2FSjocY1w0%3D&reserved=0>
url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D532972&data=05%7C02%7CERM.AreasAmsterdam%40erm.com%7Ca4f6e2fc7db04912377f8dce922bdb8%7C2fdeb8d39c4e4485ba69c1882ba88138%7C0%7C0%7C638661759015173%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C%7C%7C&sdata=P2uuMUvvsBAtJUcRr3IF7tgEELfdL7mohqbVcY%3D&reserved=0>. Then resend the message. Be sure to delete and retype the recipient's entire address before clicking Send.
* Contact the recipient by some other means, (by phone, for example) to confirm you're using the right address. Ask them if they've set up an email forwarding rule that could be forwarding your message to an incorrect address.
If the problem continues, ask the recipient to tell their email admin about the problem, and give them the error (and the name of the server that reported it) shown below. It's likely that only the recipient's email admin can fix this problem.

More Info for Email Admins
Status code: 550 5.4.1
This error occurred because a message was sent to an email address hosted by Office 365, but the address doesn't exist in the receiving organization's Office 365 directory. Directory Based Edge Blocking (DBEB) is enabled for mnakaligwa.gov.za, and DBEB rejects messages addressed to recipients who don't exist in the receiving organization's Office 365 directory. This error is reported by the recipient domain's email server, but most often it can be fixed by the person who sent the message. If the steps you take to resolve the issue don't work, contact your email admin.
Check that the email address exists and is correct - Confirm that the recipient address exists in your Office 365 directory, is correct, and is accepting messages.
Synchronize your directories - Make sure directory synchronization is working correctly, and that the recipient's email address exists in both Office 365 and in your on-premises directory.
Check for extant forwarding rules - Check for forwarding rules for the original recipient that might be trying to forward the message to an invalid address. Forwarding can be set up by an admin via mail flow rules or mailbox forwarding address settings, or by the recipient via the Forwarding or Inbox Rules features.
Make sure the recipient has a valid license - Make sure the recipient has an Office 365 license assigned to them. The recipient's email admin can use the Office 365 admin center to assign a license to them (Users > Active Users > Select the recipient > Assigned License > Edit).
Make sure that mail flow settings and MX records are correct - Misconfigured mail flow or MX record settings can cause this error. Check your Office 365 mail flow settings to make sure your domain and any mail flow connectors are set up correctly. Also, work with your domain registrar to make sure the MX records for your domain are set up correctly.
For more information and additional tips to fix this issue, see this article <https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D532974&data=05%7C02%7CERM.AreasAmsterdam%40erm.com%7Ca4f6e2fc7db04912377f8dce922bdb8%7C2fdeb8d39c4e4485ba69c1882ba88138%7C0%7C0%7C638661759015173%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C%7C%7C&sdata=%2FBtvRfGEeCwurf9FL%2BMJKTDZvmiQjGfo3ujc9FYdfjOBPY%3D&reserved=0>.

Your message to Phila.Mayisela@westerncape.gov.za couldn't be delivered.

Phila.Mayisela wasn't found at westerncape.gov.za.

ERM.AcrossAmsterdam Office 365 Phila.Mayisela
Action Required Recipient

Unknown To address

How to Fix It
The address might be misspelled or might not exist. Try one or more of the following:
* Retype the recipient's address, then resend the message - If you're using Outlook, open this non-delivery report message and click Send Again from the menu or ribbon. In Outlook on the web, select this message, and then click the "To send this message again, click here." link located just above the message preview window. In the To or Cc line, delete and then retype the entire recipient's address (ignore any address suggestions). After typing the complete address, click Send to resend the message. If the recipient's entire address is misspelled, you'll receive another non-delivery report.
* Remove the recipient from the recipient Auto-Complete List, then resend the message - If you're using Outlook or Outlook on the web, follow the steps in the "Remove a recipient's address from the Auto-Complete List" section of this article: <https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D53972&data=05%7C02%7CERM.AcrossAmsterdam%40erm.com%7Cd27ada8e2e4494497308da9220532%7C2fe6bd39c4e485bae69c1882ba881389%7C0%7C0%7C638461575527526582%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=KobOIJeuzgVqPFqQETBAp4lcvNDIcBYyf6O3v3Ka9iA%3D&reserved=0>.
Then resend the message. Be sure to delete and retype the recipient's entire address before clicking Send.
* Contact the recipient by some other means, (by phone, for example) to confirm you're using the right address. Ask them if they've set up an email forwarding rule that could be forwarding your message to an incorrect address.
If the problem continues, ask the recipient to tell their email admin about the problem, and give them the error (and the name of the server that reported it) shown below. It's likely that only the recipient's email admin can fix this problem.
Was this helpful? Send feedback to Microsoft: <https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2Fp%2F%3FLinkID%3D717197&data=05%7C02%7CERM.AcrossAmsterdam%40erm.com%7Cd27ada8e2e4494497308da9220532%7C2fe6bd39c4e485bae69c1882ba881389%7C0%7C0%7C638461575527526582%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=uCC2cjtjpt8WSAIxYT4Kqeio9HNwaNCfIdCY2f8vA9w%3D&reserved=0>
.

More Info for Email Admins
Status code: 550 5.4.1
Exchange received a message was sent to an email address hosted by Office 365, but the address doesn't exist in the receiving organization's Office 365 directory. Directory Based Edge Blocking (DBEB) is enabled for westerncape.gov.za, and DBEB rejects messages addressed to recipients who don't exist in the receiving organization's Office 365 directory. This error is reported by the recipient domain's email server, but most often it can be fixed by the person who sent the message. If the steps in the How to Fix It section above don't fix the problem, send you're the email admin for the recipient, try one or more of the following:
Check that the email address exists and is correct - Confirm that the recipient address exists in your Office 365 directory, is correct, and is accepting messages.
Synchronize your directories - Make sure directory synchronization is working correctly, and that the recipient's email address exists in both Office 365 and in your on-premises directory.
Check for errant forwarding rules - Check for forwarding rules for the original recipient that might be trying to forward the message to an invalid address. Forwarding can be set up by an admin via mail flow rules or mailbox forwarding address settings, or by the recipient via the Forwarding or Inbox Rules features.
Make sure the recipient has a valid license - Make sure the recipient has an Office 365 license assigned to them. The recipient's email admin can see the Office 365 admin center to assign a license to them (Users > Active Users > Select the recipient > Assigned License > Edit).
Make sure that mail flow settings and MX records are correct - Misconfigured mail flow or MX record settings can cause this error. Check your Office 365 mail flow settings to make sure your domain and any mail flow connectors are set up correctly. Also, work with your domain registrar to make sure the MX records for your domain are set up correctly.
For more information and additional tips to fix this issue, see this article <https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D53972&data=05%7C02%7CERM.AcrossAmsterdam%40erm.com%7Cd27ada8e2e4494497308da9220532%7C2fe6bd39c4e485bae69c1882ba881389%7C0%7C0%7C638461575527526582%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=GuCYT/W6KjzDQ57ZFs/hgfdLB5XCrU%2FnHuv%2BE1FKc0%3D&reserved=0>

---

Delivery has failed to these recipients or groups:
nonjabo@sdpc.gov.za <mailto:nonjabo@sdpc.gov.za>
Your message couldn't be delivered. The Domain Name System (DNS) reported that the recipient's domain does not exist.
Contact the recipient by some other means (by phone, for example) and ask them to tell their email admin that it appears that their domain isn't properly registered at their domain registrar. Give them the error details shown below. It's likely that the recipient's email admin is the only one who can fix this problem.
For more information and tips to fix this issue see this article: https://go.microsoft.com/fwlink/?LinkId=389361.

bongi wasn't found at gobiande.gov.za, or the mailbox is unavailable.

ERM.AccessAmsterdam Office 365 bongi
Action Required Recipient

Unknown To address

How to Fix It
The email address might be misspelled or it might not exist. Try one or more of the following:
* Retype the recipient's address, then resend the message - If you're using Outlook, open this non-delivery report message and click Send Again from the menu or ribbon. In Outlook on the web, select this message, and then click the "To:+cnd this message again, click here." link located just above the message preview window. In the To or Cc line, delete and then retype the entire recipient's address (ignore any address suggestions). After typing the complete address, click Send to resend the message. If you're using a different email program other than Outlook or Outlook on the web, follow its standard way for resending a message. Just be sure to delete and retype the recipient's entire address before resending it.
* Remove the recipient from the recipient Auto-Complete List, then resend the message - If you're using Outlook or Outlook on the web, follow the steps in the "Remove the recipient from the recipient Auto-Complete List" section of this article:<https://emea01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D532972&data=05%7C02%7CERM.AccessAmsterdam%40erm.com%7C5cd78a58e9fc4375c008f8dce922034b%7C2f1e6a03fc4a4658aa69e1882ba8013f%7C0%7C0%7C638641579517662697%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=coo4cgaVmP%2FOWDtBjWW%2Bn138c5oeyIUnd%2BaKc6c5%3D&reserved=0>.
Then resend the message. Be sure to delete and retype the recipient's entire address before clicking Send.
* Contact the recipient by some other means, (by phone, for example) to confirm you're using the right address. Ask them if they've set up an email forwarding rule that could be forwarding your message to an incorrect address.
If the problem continues, forward this message to your email admin. If you're an email admin, refer to the More Info for Email Admins section below.

.

Mere Info for Email Admins
Status code: 550 5.1.351
When Office 365 tried to send the message, the external email server returned an error stating that the recipient is unknown or the mailbox is unavailable. This error was reported by an email server outside Office 365.
If you or the sender can't fix the problem, contact the responsible party's email admin. • Give them the error code and error message from this non-delivery report (NDR) to help them troubleshoot the issue. To determine who the responsible party might be, check the error for information about where the problem is happening. For example, look for a domain name like contoso.com. A domain name in the error might suggest who is responsible for the error. It could be the recipient's email server, or it could be a third-party service that your organization or the recipient's organization is using to process or filter email messages.
Although the sender might be able to fix the issue by correcting the recipient address, it's likely that only the recipient's email admin can fix the problem. Unfortunately, it's unlikely Office 365 Support will be able to help with those kinds of externally reported errors.

ERM Access Amsterdam Office 365 makhabanepi
Action Required Recipient

Unknown To address

How to Fix It
The address may be misspelled or may not exist. Try one or more of the following:
* Send the message again following these steps: In Outlook, open this non-delivery report (NDR) and choose Send Again from the Report ribbon. In Outlook on the web, select this NDR, then select the link "To send this message again, click here." Then delete and retype the entire recipient address. If prompted with an Auto-Complete List suggestion don't select it. After typing the complete address, click Send.
* Contact the recipient (by phone, for example) to check that the address exists and is correct.
* The recipient may have set up email forwarding to an incorrect address. Ask them to check that any forwarding they've set up is working correctly.
* Clear the recipient Auto-Complete List in Outlook or Outlook on the web by following the steps in this article: Fix email delivery issues for error code 5.1.1 in Office 365 <https://emailfl.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D389383&data=05%7C02%7CERM.Access.Amsterdam%40erm.com%7C72f3b409ca8b4894497380&sdata=05%7C02%7CERM.Access.Amsterdam%40erm.com%7C72f3b409ca8b4894497380dcc9228532%7C2f2e0ed3b9c4e4f5baa69c1882ba8b1309%7C0%7C0%7C638641579527694023%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=tXE%2FXC+r81+e9%2FRFtFLo%2Fr1oZnhlC%2FMZo74%3D&reserved=0>
, and then send the message again. Retype the entire recipient address before selecting Send.
If the problem continues, forward this message to your email admin. If you're an email admin, refer to the More Info for Email Admins section below.

.

More Info for Email Admins
Status code: 550 5.1.1
This error occurs because the sender sent a message to an email address outside of Office 365, but the address is incorrect or doesn't exist at the destination domain. The error is reported by the recipient domain's email server, but most often it must be fixed by the person who sent the message. If the steps in the How to Fix It section above don't fix the problem, and you're the email admin for the recipient, try one or more of the following:
The email address exists and is correct - Confirm that the recipient address exists, is correct, and is accepting messages.
Synchronize your directories - If you have a hybrid environment and are using directory synchronization make sure the recipient's email address is synced correctly in both Office 365 and in your on-premises directory.
Extract forwarding rule - Check for forwarding rules that aren't behaving as expected. Forwarding can be set up by an admin via mail flow rules or mailbox forwarding address settings, or by the recipient via the Inbox Rules feature.
Mail flow settings and MX records are not correct - Microsoftgenerated mail flow or MX record settings can cause this error. Check your Office 365 mail flow settings to make sure your domain and any mail flow connectors are set up correctly. Also, work with your domain registrar to make sure the MX records for your domain are configured correctly.
For more information and additional tips to fix this issue, see Fix email delivery issues for error code 550 5.1.1 in Office 365 <https://emailfl.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgo.microsoft.com%2Ffwlink%2F%3FLinkId%3D389383&data=05%7C02%7CERM.Access.Amsterdam%40erm.com%7C72f3b409ca8b4894497380dcc9228532%7C2f2e0ed3b9c4e4f5baa69c1882ba8b1309%7C0%7C0%7C638641579527694023%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C0%7C%7C%7C&sdata=LJqLdoNEcyGBpcVbAp0U3qYRZKg%2BW8xUdfM7RgWpM%3D&reserved=0>

APPENDIX 8 MTPA AND DARDLEA MEETING MINUTES

MULILO AMSTERDAMN WEF MEETING AGENDA

LOCATION	The Capital Mbombela, 4 Penny Gum Avenue, 1202 Nelspruit, South Africa
DATE	14 May 2025
TIME	12:00 – 13:30
TOPIC	Engagement on DARDLEA Comments

Item	Topic	Lead
1.	**Welcome and Introductions** • Brief introductions of attendees • Purpose of the meeting	Lloyd Barnes
2.	**Overview of DARDLEA's Comments on the Draft EIA Reports** • Summary of key comments and concerns • Clarification of any specific points	MPG - Robyn Luyt
3.	**Specialist Discussion: Avifaunal Comments** • Detailed discussion of avifaunal issues raised by DARDLEA • Specialist's response and clarification	AfriAvian - Albert Froneman
4.	**Strategic Insight: Importance of Wind Energy and the Just Energy Transition** • Importance of renewable energy for the province • The role of wind energy in supporting the Just Energy Transition	Mulilo: Group Chairman – Jan Oberholzer
5.	**Terrestrial Ecology: Intact Grasslands and Other Considerations** • Discussion of intact grasslands and other sensitive terrestrial features	Lloyd Barnes
6.	**Closing Remarks** • Final thoughts from DARDLEA, MUL, and consultant team • Meeting close	Lloyd Barnes

WELCOME AND OPENING REMARKS

- Lloyd Barnes opened the meeting, thanking attendees and acknowledging the importance of the engagement.
- Clarified that the meeting was initiated by Mulilo to discuss comments received from MTPA and DARDLEA on the draft EIA.

PROJECT OVERVIEW

- Amsterdam Wind Cluster comprises two wind farms: Emvelo (22 turbines) and Sheepmoor (25 turbines), located near Ermelo and Camden Power Station.
- Turbine numbers and blade lengths have been reduced to address environmental sensitivities.
- Grid connection planned via Camden B Main Transmission Substation.
  Project timeline:
  - Final EIA submission: imminent
  - Environmental decision: expected July 2025
  - Financial close: Q2–Q3 2026
  - Operations commencement: late 2028

STRATEGIC CONTEXT AND JUST ENERGY TRANSITION

- Jan Oberholzer (Chairman, Mulilo) emphasized:
  - Mulilo's transformation post-acquisition by Copenhagen Infrastructure Partners.
  - The critical role of renewable energy in South Africa's energy transition.
  - The need for robust transmission infrastructure.
  - Importance of Mpumalanga as a strategic location due to grid availability and aging coal infrastructure.

COMMENTS AND CONCERNS FROM AUTHORITIES

- Mervyn Lotter (MTPA) clarified that the meeting was not requested by MTPA/DARDLEA but welcomed the engagement.
- Reiterated support for renewable energy and the Just Transition, while emphasizing the need for rigorous environmental scrutiny.

CUMULATIVE IMPACT AND VIABILITY DISCUSSION

- Rebecca Thomas presented data on project viability:
  - Only ~5% of renewable energy projects nationally reach commercial operation.
  - Grid availability in Mpumalanga may increase this percentage.
  - Authorities emphasized the need to assess cumulative impacts assuming full build-out of authorized projects, per precautionary principles.

ENVIRONMENTAL SENSITIVITIES AND MITIGATION

- Albert Froneman (Avifaunal Specialist) outlined:
  - Extensive bird monitoring, including Marshall Eagle tracking.
- Multi-tiered mitigation strategy:
  - Avoidance of high-risk areas

- Shutdown-on-demand (day and night)
- Proactive curtailment based on environmental triggers
- Radar systems for nocturnal species
- Commitment to transparency, annual reporting, and open access for research and audits.

TERRESTRIAL AND BIODIVERSITY CONSIDERATIONS

- Lloyd Barnes and team addressed:
  - Reduction of turbines in sensitive areas (e.g., CBA irreplaceable, intact grasslands).
  - Proposal to manage and rehabilitate 326 hectares of vegetation.
  - Acknowledgement of the need for stewardship and biodiversity management plans.

PROCESS AND PROCEDURAL CLARIFICATIONS

- Robyn Luyt (DARDLEA) raised concerns about:
  - Lack of opportunity to review revised layouts and mitigation before final EIA submission.
  - Need for transparency and early engagement on substantive changes.
- Mulilo committed to:
  - Sharing updated layouts and comment-response reports with authorities before final submission.
  - Considering a follow-up engagement if time permits.

CLOSING REMARKS

- Authorities reiterated the importance of:
  - Avoiding development in intact grasslands and sensitive bird habitats.
  - Ensuring mitigation is evidence-based and enforceable.
  - Mulilo acknowledged the feedback and committed to continued collaboration.

ACTION ITEMS

Action	Responsible	Due Date
Share updated layout and comment-response report	Mulilo	Before 27 May 2025
Review and provide feedback on revised documents	MTPA & DARDLEA	As soon as received
Consider follow-up meeting if needed	All parties	TBD

2.3 THE PROVISIONS OF THE EIA REGULATIONS APPLICABLE TO THE SUBMISSION AND CONSIDERATION OF AN EIA REPORT AND SUPPORTING DOCUMENTS TO THE COMPETENT AUTHORITY 5

3. MY ADVICE **8**

1. INTRODUCTION

We act for Mulilo Renewable Project Developments (Pty) Ltd.

Our instructions are that client proposes undertaking the development of two wind energy facilities ("WEFs") where three WEFs were originally envisaged.

The three WEFs originally envisaged were the Sheepmoor WEF; the Emvelo WEF and the Rochdale WEF. The current proposal is to incorporate areas from the Rochdale WEF into the two remaining projects (the Sheepmoor and Emvelo WEFs) following the scoping phase, which excluded most of the turbines originally part of the Rochdale WEF.[1] This is explained in more detail in the two paragraphs directly below.

The Sheepmoor WEF, as approved for the EIA phase after acceptance of the scoping report by the Department of Forestry, Fisheries and the Environment ("DFFE")[2] will now include properties that were assessed as part of the scoping process for the Emvelo WEF and the Sheepmoor WEF.

The Emvelo WEF will, for purposes of the EIA phase for that WEF, now include immovable properties assessed, and accepted by DFFE, pursuant to the Emvelo and Rochdale scoping processes.[3]

The Chief Directorate: Environmental Affairs[4] in the DFFE (i.e. the competent authority) has confirmed in writing that the proposed approach as described above is substantively sound, and that the Sheepmoor and Emvelo WEFs (collectively the Amsterdam Cluster herein) can both proceed to the EIA phase.

DFFE's Chief Directorate: Integrated Environmental Authorisations has confirmed DFFE's opinion in writing, in the following terms:

---

[1] Our instructions are that the number of turbines originally envisaged for the Rochdale WEF were scoped out principally because of concerns pertaining to aspects raised by the civil aviation authority; and potential impacts on avifauna.

[2] By letter dated 19 November 2024 and signed by Ms. Masina Morudu. Ms. Morudu is the Designated Control Environmental Officer: National Integrated Authorisation, and at the behest of Dr. Sabelo Malaza the Chief Director: Integrated Environmental Authorisations in DFFE.

[3] The Emvelo and Rochdale scoping reports and respective plans of study for environmental impact assessment (PoSEIA) dated October 2024 and received by the Department on 7 October 2024 were accepted by Ms. Morudu for and on behalf of Dr. Malaza on 19 November 2024.

[4] Represented by Ms. Milicent Solomons of the Chief Directorate: Integrated Environmental Authorisations in the Department of Forestry, Fisheries and Environment ("DFFE"). Ms. Solomons expressed the competent authority's position in an email to our client's Mr. Barnes dated 17 February 2025.

"*The trailing emails below refer. Please note the opinion of the Chief Directorate: Integrated Environmental Authorisations after internal consultation …*

2. *In terms of the EIA Regulations, 2014 (as amended) we do not see any prohibition of the proposed process, incorporating the 20% of the Rochdale site into the Emvelo application. The project scope and the relevant assessments will have to comply with all legislative requirements.*

3. ***However it is important to indicate that we foresee several challenges, should you adopt to follow this process:***

   a. *This is the 2nd application for the same development and as you are aware a few concerns have been raised by stakeholders.*

   b. *The screening reports and approved plan of study does not include this portion of the property (20% of Rochdale) and will very likely be challenged by stakeholders. The current approved plan of study and terms of reference for Emvelo does not include the 20% of Rochdale and this can be challenged based on procedure.*

Based on the potential risks, we suggest that you consider withdrawing the two applications in question, i.e. Rochdale and Emvelo and submit one application as Emvelo (including 20% Rochdale portion). The screening report and the plan of study will include the whole area; all stakeholders will have an opportunity to comment and provide input at scoping phase during the public review process." (My underlining; bold text as in the original.)

As regards the *verbatim* extract above from the emailed correspondence from the DFFE's Chief Directorate: Integrated Environmental Authorisation, in summary, and in my considered view, any procedural challenge would only have reasonable prospects of success if the public/registered interested and affected parties ("I&APs") are excluded from the EIA phase, which is not client's intention nor the practice that will be followed.

All relevant stakeholders will be entitled to participate fully in the EIA process, which will conform to the requirements of regulation 23 of the NEMA EIA Regulations (which governs the submission and consideration of EIA Reports and supporting documents to the competent authority; and Chapter 6[5] in the latter Regulations, which governs pubic participation; and regulation 45[6] of EIA Regulations, which stipulates adherence to the regulatory time-frames.

[5] Chapter 6 is titled "*Public participation*".

[6] Regulation 45 is included in Chapter 7 of the NEMA EIA Regulations, titled "*General matters*".

The public participation processes obliged in the DFFE's letters accepting the respective scoping reports are exactly the same. In other words, even with the proposed inclusion of turbines from the Rochdale WEF in the Emvelo WEF, and turbines from the Emvelo WEF in the Sheepmoor WEF, the same nature and extent of PPP is obliged of the applicant.

What is also clear from our instructions[7] is that our client is not proposing to expand upon the areas already assessed during scoping.[8] As such, there can be no suggestion of procedural or substantive unfairness in the EIAs as authorised by the DFFE and to be undertaken respectively for the Emvelo and Sheepmoor WEFs.

If the areas assessed during the two EIAs were to be increased (either additionally or cumulatively) then there could be an argument that the scoping process should commence afresh. The same principle would apply if additional NEMA-listed activities were to be triggered by the proposed merger of the three WEFs originally envisaged into the two WEFs now proposed for purposes of EIA. On the facts, neither of these scenarios arises, and it follows that the two WEFs now contemplated can lawfully be progressed to the EIA phase, with particular reference to meeting the procedural and substantive requirements laid down in DFFE's acceptance letters dated 19 November 2024.

2. THE APPLICABLE LAW

2.1 The constitutional point of departure in respect of fair process

Section 33 of the Constitution[9] provides that administrative action (in this instance, the DFFE's decision-making procedures that pertain to the grant or refusal of EA after the EIA phase) must be lawful, reasonable and procedurally fair.[10]

---

[7] By email from client's Mr. Barnes.

[8] See the unnumbered second paragraph of our emailed instructions.

[9] Act 108 of 1996 (as amended).

[10] Section 33 of the Constitution (titled "*Just administrative action*") reads as follows in full: "*(1) Everyone has the right to administrative action that is lawful, reasonable and procedurally fair (2) everyone whose rights have been adversely affected by administrative action has the right to be given written reasons (3) National legislation must be enacted to give effect to these rights, and must – (a) provide for the review of administrative action by a court or, where appropriate, an independent and impartial tribunal; (b) impose a duty on the State to give effect to the rights in sub-sections (1) and (2); and (c) promote an efficient administration.*" (We mention for the sake of completeness that the national legislation enacted to give effect to the right to just administrative action is the Promotion of Administrative Justice Act, 3 of 2000).

Procedural fairness will depend on the facts of the particular administrative action in question as well as the prevailing law that applies to a particular procedure.[11]

2.2 **The requirements in NEMA pertaining to procedural fairness**

In this instance, procedural fairness in respect of the two WEF applications to be proceeded with by client to the EIA phase and pursuant to acceptance of the scoping phase is regulated in the main by the NEMA EIA Regulations, and in particular, the requirements incumbent upon an applicant as those are set out in Chapter 6 of the aforesaid Regulations.

Before considering the procedural requirements (or safeguards) articulated in the NEMA EIA Regulations, it is useful to have regard to the provisions of NEMA itself.

Among the relevant principles in NEMA's section 2 are the following:

Section 2(3) of NEMA stipulates that:

> "*Development must be socially, environmentally and economically sustainable.*"

Section 2(4)(b) of NEMA provides that:

> "*Environmental management must be integrated, acknowledging that all elements of the environment are linked and inter-related, and it must take into account the effects of decisions on all aspects of the environment and all people in the environment by pursuing the selection of the best practicable environmental option.*"

Section 2(4)(f) of NEMA obliges the following:

> "*The participation of all interested and affected parties in environmental governance must be promoted, and all people must have the opportunity to develop the understanding, skills and capacity necessary for achieving equitable and effective participation, and participation by vulnerable and disadvantaged persons must be ensured.*"

Section 2(4)(g) of NEMA stipulates that:

> "*Decisions must take into account the interests, needs and values of all interested and affected parties, and this includes recognising all forms of knowledge, including traditional and ordinary knowledge.*"

---

[11] See *Director: Mineral Development, Gauteng Region and Another v Save the Vaal Environment and Others* (133/98) [1999] ZASCA 9; [1999] 2 All SA 381 (A) (12 March 1999).

Section 2(4)(k) of NEMA provides that:

> "*Community well-being and empowerment must be promoted through environmental education, the raising of environmental awareness, the sharing of knowledge and experience and other appropriate means.*"

The general objectives of integrated environmental management in section 23 of NEMA include ensuring "*… adequate and appropriate opportunity for public participation in decisions that may affect the environment.*"

It is clear with reference to the Constitution and the primary regulation that gives effect to the environmental assessment process that public participation forms an integral part of any environmental assessment process, whether basic assessment or (as in this instance) scoping and EIA.

On the facts of the present matter DFFE's Chief Director: Integrated Environmental Authorisations[12] has accepted the scoping reports respectively for the Rochdale WEF; the Sheepmoor WEF and the Emvelo WEF. He has also accepted the plan of study for the EIA in each instance, dated October 2024 and received by DFFE on 7 October 2024. In each case, the EAP employed by Environmental Resource Management Southern Africa (Pty) Ltd[13] has been authorised to proceed "*… with the* [EIA] *process in accordance with the tasks contemplated in the* [plan of study for EIA] *as required in terms of the EIA Regulations, 2014, as amended. The EIA report must comply with the requirements of appendix 3 of the EIA Regulations 2014, as amended*".

In each instance the DFFE's Chief Directorate has progressed the scoping phase with particular reference to regulation 22(a) of the NEMA EIA Regulations. That regulation provides that the competent authority must, within 43 days of receipt of a scoping report accept the scoping report, with or without conditions, and advise the applicant to proceed or continue with the tasks contemplated in the plan of study for EIA.

Subsequent to DFFE's acceptance of the scoping report, client's EAP attended a meeting with DFFE, the aim of which was to formally present the proposed way forward post-scoping approval, for the proposed WEFs in this matter. Another principal aspect for discussion was the review and discussion of agreed changes to the project boundaries in the EIA phase. It is clear from the minutes of the meeting that the remaining turbines comprising the Rochdale WEF "*… will be merged with Emvelo*". The scope of the Sheepmoor WEF has been reduced and will include a small portion of the previous Emvelo application. It is clear from the minute of the meeting that the updated Sheepmoor and Emvelo WEFs are contemplated for completion in terms of regulations 31 and 32 of the NEMA EIA Regulations. The provisions of the EIA

[12] Dr. Sabelo Malaza.

[13] Ms. Stephanie Gopaul.

Regulations applicable to the submission and consideration of an EIA report and supporting documents to the competent authority

Regulation 23(1) obliges the applicant for EA, within 106 days of the acceptance of the scoping report to submit an EIA report inclusive of any specialist reports, and an EMPr (in this instance, by no later than Thursday 27 March 2025[14]).

The submission of the EIA report and accompanying EMPr is subject to a peremptory procedural requirement: Both documents "*… must have been subjected to a public participation process of at least 30 days and* [they must reflect] *the incorporation of comments received, including any comments of the competent authority.*"

In the alternative the applicant must submit to the competent authority a notice in writing that the documents contemplated in regulation 23(1)(a) will be submitted within 156 days of acceptance of the scoping report by the competent authority, as significant changes have been made or significant new information has been added to the documents, which changes or information was not contained in the original documents consulted on during the initial public participation process contemplated in sub-regulation 1(a), and that the revised documents contemplated in sub-regulation 1(a) will be subjected to another public participation process of at least 30 days.

In the circumstances there can be no suggestion that the relevant procedural safeguards in relation to an EIA report pertaining to the two proposed WEFs (Emvelo and Sheepmoor) will not occur.

Another of the substantive requirements in regulation 23 that includes a procedural safeguard is to be found in regulation 23(3) which provides as follows:

> "*An* [EIA] *report must contain all information set out in appendix 3 to these Regulations or comply with a protocol or minimum information requirements relevant to the application as identified and gazetted by the Minister in a Government Notice.*"

The EMPr delivered simultaneously with the EIA report must contain all information set out in appendix 4 to the EIA Regulations or must be a generic EMPr relevant to the application as identified and gazetted by the Minister.

Specialist reports must contain all information set out in appendix 6 to the NEMA EIA Regulations.

---

[14] The 106-day period must exclude the period from 15 December 2024 to 5 January 2025. In this regard, regulation 3(2) of the NEMA EIA Regulations provides as follows: "*For any action contemplated in terms of these Regulations for which a timeframe is prescribed, the period of 15 December to 5 January must be excluded in the reckoning of days.*"

As regards the scope of assessment and content of EIA reports as regulated by appendix 3 to the EIA Regulations it is important to have regard to paragraph 2 thereunder which provides the following:

> "*The objective of the EIA process is to, through a consultative process –*
>
> *(a) Determine the policy and legislative context within which the activity is located and document how the proposed activity complies with and responds to the policy and legislative context;*
>
> *(b) describe the need and desirability of the proposed activity, including the need and desirability of the activity in the context of the development footprint on the approved site as contemplated in the accepted scoping report.*"

As to the scope of assessment and content of EIA reports appendix 3 contains certain peremptory obligations (i.e. the report "*… must contain the information that is necessary for the competent authority to consider and come to a decision on the application and must include – (h) a full description of the process followed to reach the proposed development footprint within the approved site as contemplated in the accepted scoping report, including: … (iii) a summary of the issues raised by interested and affected parties, and an indication of the manner in which the issues were incorporated, or the reasons for not including them ...; (i) a full description of the process undertaken to identify, assess and rank the impacts the activity and associated structures and infrastructure will impose on the preferred development footprint on the approved site as contemplated in the accepted scoping report through the life of the activity, including – (i) a description of all environmental issues and risks that were identified during the EIA process; and (ii) an assessment of the significance of each issue and risk and an indication of the extent to which the issue and risk could be avoided or addressed by the adoption of mitigation measures.*")

Also required is a reasoned opinion from the EAP as to whether the proposed activity should or should not be authorised, and if the opinion is that it should be authorised, any conditions that should be made in respect of that authorisation.[15]

Another important obligation incumbent upon the EAP is set out in paragraph 3(1)(s) which obliges the EAP, under oath or affirmation to confirm the inclusion of comments and inputs from stakeholders and I&APs as well as any information provided by the EAP to I&APs and any responses by the EAP to comments or inputs made by interested or affected parties.

[15] See paragraph 3(1)(q) in appendix 3.

It is clear that the procedure pertaining to EIA after the acceptance of a scoping report includes detailed procedural requirements which act as a bulwark in respect of fair and defensible public participation.

In the circumstances and provided that the EAP ensures full and proper public participation with all I&APs registered during the scoping phase (as accepted by the DFFE) there should be no procedural difficulties with the proposed merger of the originally envisaged three WEFs into two WEFs.

3. **MY ADVICE**

Mulilo needs to ensure that there is a detailed but succinct explanation contained in the EIA reports of the following:

(1) How the scoping phase for each WEF culminated in the DFFE's approval thereof on 19 November 2024, which acceptance letters include reference to PPP in the EIA phase as follows:

- Under the heading "*General Comments*" at paragraph 1 the acceptance of the scoping report reads as follows:

  "*The meeting minutes in Appendix F of the* [PP] *Report refers. The discussions during the meeting with the Mpumalanga Department of Agriculture, Rural Development, Land and Environmental Affairs (DARDLEA) and the Mpumalanga Tourism & Parks Agency (MTPA) on 11 September 2024 are noted.*"

- Under the heading "*Public Participation*" in DFFE's written acceptance of the scoping report the following is recorded:

  "*10. Proof of correspondence with the various stakeholders must be included in the EIAr. This must indicate that this draft EIAr has been subjected to 30 days* [PPP]*, stating the start and end date of the PPP.*

  11. Please ensure that comments from all relevant stakeholders are submitted to the Department with the EIAr.

  12. Should you be unable to obtain comments, proof should be submitted to the Department of the attempts that were made to obtain comments. Please provide proof of written notice for the availability of the draft EIAr for comment.

  13. All issues raised and comments received must be incorporated into the Comments and Response Report (CRR).

14. *Comments from I&APs must not be split and arranged into categories. Comments from each submission must be responded to individually.*

15. *Please refrain from summarising comments made by I&APs. All comments from I&APs must be copied verbatim and responded to clearly. Please note that a response such as "noted" is not regarded as an adequate response to an I&AP's comments.*

16. *The CRR addresses comments on the draft SR, which have been received from organs of state, however, copies of these comments are not included in the report. Copies of original comments received from I&APs and organs of state, which have jurisdiction in respect of the proposed activity must be submitted to the Department with the EIAr.*

17. *If applicable, the attendance registers and minutes of any meetings held by the Environmental Assessment Practitioner (EAP) with I&APs and other role players must be included in the EIAr.*

18. *The newspaper advert proof in Appendix C of the* [PP] *Report refers. Please submit a full page of the newspaper(s) containing the advertisement, ensuring that the name of the newspaper and date are visible. (Underlining as in the original.)*

- As regards comments from organs of state paragraph 19 (under the heading "*Specialist assessments*") provides as follows:

  "*Interim and final comments from the South African Heritage Resources Agency (SAHRA) must be addressed and incorporated in the EIAr.*"

(2) Subsequent to the approval of the scoping phase it became clear that only some of the turbines comprising the Rochdale WEF could be erected.

(3) The proposal assessed in the EIA is to merge Rochdale's remaining turbines into the Emvelo WEF, and the registered stakeholders (i.e. I&APs) are entitled to participate fully in the on-going EIA process.

My advice is that there can be no procedural prejudice to the registered I&APs provided that they are fully engaged in the statutory PPP as envisaged in NEMA, the EIA Regulations and the relevant provisions of the letter from DFFE that confirms the Chief Director: Integrated Environmental Authorisation's acceptance of the scoping reports at issue in this matter. There is a substantively good *rationale* for the accepted scoping report for the Sheepmoor WEF now including properties that were assessed (and

accepted by DFFE) as part of the Emvelo and Sheepmoor scoping processes, which will now form part of the Sheepmoor WEF.

The same *rationale* applies to the accepted scoping report for the Emvelo WEF now including properties that were assessed (and accepted by DFFE) as part of the Emvelo and Rochdale scoping processes, which will now form part of the consolidated Emvelo WEF.

In an abundance of caution, the EAP could include DFFE's Chief Directorate's emailed correspondence to client's Mr. Barnes as an annexure to the two EIA reports to be submitted by 27 March 2025.

It would also be useful to append an aerial photograph that shows conclusively that the consolidated and respective Sheepmoor and Emvelo WEFs incorporate properties that were assessed during scoping and accepted as such in DFFE's acceptance letters dated 19 November 2024. As already pointed out, there can be no suggestion that the now-proposed Sheepmoor WEF and Emvelo WEF include any properties that were not the subject of the scoping exercise that culminated in the acceptance of the scoping reports. An aerial photograph as proposed would provide the reader of this memorandum with conclusive evidence in that regard.

We advise accordingly.

PREPARED at CAPE TOWN on this 6th day of MARCH 2025
