

# Gas Company Climate Planning Tool: User Guide

Version 2.0 (June 2022)

# Overview & Contacts

---

On behalf of Environmental Defense Fund (EDF) and through its development of a framework to quantify life cycle emissions of delivered natural gas, MJB&A developed the “Gas Company Climate Planning Tool,” a complementary Excel-based resource.

**This tool can provide analytical support to natural gas utilities and other stakeholders by evaluating:**

- Company-specific life cycle GHG emissions associated with delivered gas;
- GHG emissions and delivered energy demand across business-as-usual (BAU) and user-defined scenarios; and
- Impacts and changes in emissions, social cost of carbon savings, and gas demand resulting from gas company upgrades and application of supply- and demand-side strategies

**This tool does not perform an economic analysis and does not account for any economic or financial characteristics that may influence assumptions, gas demand, or the application of strategies.**

This tool can be downloaded on our website at: <https://www.sustainability.com/thinking/gas-company-climate-planning-tool/>.

# Tool Dashboard

## Assumptions & Inputs

**Assumptions & Inputs**

**Analysis Parameters**

State:  Company:  GWP Values:  Selected → CO2=1, CH4=82.5, N2O=273, H2 (indirect)=33

**CUSTOM SCENARIOS** [Create scenarios](#)

Conservative Intermediate Aggressive [Export Inputs & Results](#)

Restore default upstream & company emission inputs [Reset](#) [Export Results](#)

**Cell Color Key**

| User-defined | Automated/active | Calculated/active |
|--------------|------------------|-------------------|
| Inactive     | Critical error   | Change rec'd      |

**Company Emissions**

Distribution emission factors (EF) applied to companies w/in New York\*

Default EF: State Avg. (EPA Subpart W) CH4 Loss %: 0.21%

Applied EF: Default Custom CH4 Loss %: 0.10% Applied CH4 Loss %: 0.21% Custom CH4 loss %: [User LDC](#)

\*CO2, CH4, and N2O emission factors

**Upstream Emissions**

**Production & Processing**

Basin(s) of produced NG and upstream emission factors (EF)

| Default Basin* | Applied | Custom Basin | Gas Share |
|----------------|---------|--------------|-----------|
| Appalachia     | Default | Appalachia   | 50%       |
| Arkoma         | Default | Gulf Coast   | 50%       |

Applied EF:  Custom EF: [User Upstream](#)

\*Default basins are nearby and suggestions; may not reflect actual basin(s)

**Transmission to City Gate**

Distance (miles) from gas production basin(s) to New York

| Default Mileage* | Applied | Custom Mileage |
|------------------|---------|----------------|
| 420              | Default | 500            |
| 1,400            | Default | 500            |

Applied EF:

\*Default mileage is estimated; may not reflect accurate pipeline distance

**Demand- and Supply-Side Strategies**

**Demand-Side Options**

Gas Demand:  [Reset](#)

**Demand Reduction via Energy Efficiency**

|                  | 2021-2030 | 2031-2040 | 2041-2050 |
|------------------|-----------|-----------|-----------|
| Annual Reduction | 0.50%     | 0.55%     | 0.60%     |

**Demand Changes via Electrification**

| Sectors Included  | 2030 | 2040 | 2050 |
|-------------------|------|------|------|
| All (exc. Power)  | 10%  | 25%  | 50%  |
| % Gas Demand      | 84%  | 87%  | 90%  |
| Zero-e Grid Share | 84%  | 87%  | 90%  |

(2020 share: 52%) Note: Zero-e share may reduce power sector gas demand

Applied Zero-e: 2030: 84% 2040: 87% 2050: 90%

AEO 2022 Zero-e: 2030: 75% 2040: 80% 2050: 85%

**Marginal Electricity Considerations**

**RNG/Biomethane Feedstock**

| Source   | 2030 | 2040 | 2050 |
|----------|------|------|------|
| Dairy    | 35%  | 30%  | 25%  |
| Landfill | 30%  | 35%  | 40%  |
| WWT      | 35%  | 35%  | 35%  |

## Summary of Results

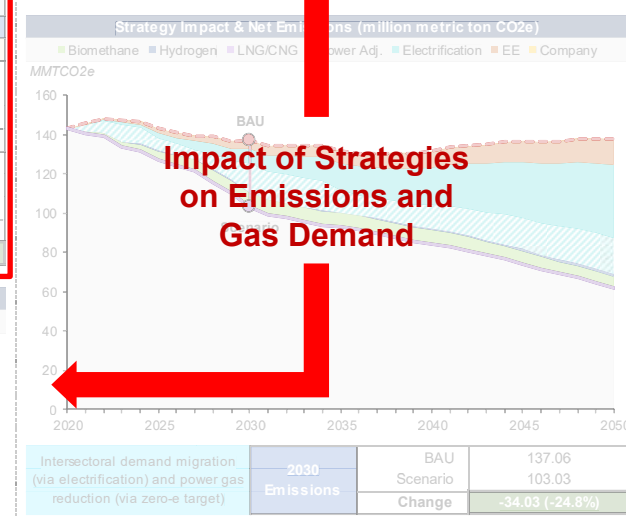

**Annual Life Cycle Emissions (million metric ton CO2e, MMTCO2e)**

|      | BAU    | Scenario | Change | % Change |
|------|--------|----------|--------|----------|
| 2030 | 137.06 | 103.03   | -34.03 | -24.8%   |
| 2040 | 131.38 | 84.43    | -46.96 | -35.7%   |
| 2050 | 137.75 | 61.88    | -75.88 | -55.1%   |

**Annual Impact of Strategies in 2030**

|                         | % Change (2030 vs. 2020) | Emissions Δ |
|-------------------------|--------------------------|-------------|
| <b>Company Upgrades</b> |                          |             |
| Total                   | -3.1%                    | -3.1%       |
| <b>Demand-Side</b>      |                          |             |
| Electrification         | -7.6%                    | -6.8%       |
| Power Adj.              | -14.6%                   | -8.9%       |
| Total                   | -26.5%                   | -19.3%      |
| <b>Supply-Side</b>      |                          |             |
| LNG/CNG                 | 0.0%                     | -0.6%       |
| Hydrogen                | -0.1%                    | -1.6%       |
| Biomethane              | -7.3%                    | -4.9%       |
| Total                   | -7.5%                    | -5.5%       |
| <b>Total Change</b>     | -34.0%                   | -24.8%      |

# Assumptions & Inputs: Upstream Emissions

## Upstream Reset

- Resets all upstream emission inputs to default assumptions

Restore default upstream & company emission inputs

Reset

## Upstream Emissions

### Production & Processing

Basin(s) of produced NG and upstream emission factors (EF)

| Default Basin* | Applied | Custom Basin | Gas Share |
|----------------|---------|--------------|-----------|
| Appalachia     | Default | Appalachia   | 50%       |
| Arkoma         | Default | Gulf Coast   | 50%       |

Applied EF

NETL+EDF

Custom EF Inputs (slide 11)

\*Default basins are nearby and suggestions; may not reflect actual basin(s)

### Transmission to City Gate

Distance (miles) from gas production basin(s) to New York

|                  | Default Mileage* | Applied | Custom Mileage |
|------------------|------------------|---------|----------------|
| Appalachia to NY | 420              | Default | 500            |
| Arkoma to NY     | 1,400            | Default | 500            |

Applied EF

NETL+EDF

\*Default mileage is estimated; may not reflect accurate pipeline distance

## Production & Processing

### Default Basin

- Nearby/suggested natural gas production basin(s)

### Applied

- Specify whether gas originates from suggested basin(s) or user-specified, "Custom" basin(s)

### Custom Basin (if applicable)

- If "Custom" basin selected, define production basin

### Gas Share

- Define share of gas originating from active basin(s)

### Applied Emission Factor

- Select source of gas production & processing emission factors (NETL factors or NETL factors adjusted using EDF methane studies)

## Transmission to City Gate

### Default Mileage

- Estimated pipeline mileage from gas production basin(s) to selected company

### Applied

- Specify whether pipeline mileage is calculated ("Default") or user-specified ("Custom")

### Custom Mileage

- If "Custom" mileage selected, define distance (in miles) from specified production basin(s) to company

### Applied Emission Factor

- Same as production & processing (for consistency)

# Assumptions & Inputs: Supply-Side Strategies

## Reset

- Reset energy efficiency and electrification inputs to zero

### Supply-Side Options

Supply breakdown of delivered gas

Reset

#### Supply Targets (% delivered energy)

| Fuel Type         | 2030   | 2040   | 2050   |
|-------------------|--------|--------|--------|

#### RNG/Biomethane Feedstock

| Source   | 2030 | 2040 | 2050 |
|----------|------|------|------|
| Dairy    | 35%  | 30%  | 25%  |
| Landfill | 30%  | 35%  | 40%  |
| WWT      | 35%  | 35%  | 35%  |

## Supply Targets (% delivered energy)

### Fuel Types

- Define fuel type share of delivered gas
  - See “Biomethane Feedstock” assumptions below
  - Linear change to meet defined shares assumed in intermediate years

## Biomethane Feedstock

### Biomethane Sources

- Define feedstock share
  - Linear change to meet defined shares assumed in intermediate years

## User-Defined Company CH<sub>4</sub> Loss Rate

### 2020 CH<sub>4</sub> Loss

- Applied methane loss rate in 2020

### Applied CH<sub>4</sub> Loss %

- Specify how CH<sub>4</sub> loss rate changes in future (no change or “Custom” change)

### Annual CH<sub>4</sub> Loss % Changes (if applicable)

- If “Custom” Applied CH<sub>4</sub> Loss % selected, specify method for future year loss rates
- If “Manual” selected, specify annual CH<sub>4</sub> loss % in “Manual CH<sub>4</sub> Loss %” cells (row 16)
- If “Calculated” selected, see below

### Annual Reduction in CH<sub>4</sub> Loss % (if applicable)

- Specify annual reduction in CH<sub>4</sub> loss %

## Custom Demand

### User Input

- Specify how gas demand forecasts are calculated
- “CAGR” applies annual growth rate to each sector
- “Annual Demand” requires manual entry of forecasts

### Gas Unit

- Define unit in which forecasts are calculated (mcf or MMBtu)

### Demand Breakdown (if applicable)

- If “Annual Demand” is selected as User Input, specify if manual entry will be total company demand (“Total”) or broken down by sector (“Sector-Specific”)

### Sector Demand Share

- If “Total” is selected as Demand Breakdown, select how total demand is distributed across sectors
- “AEO 2022” applies AEO 2022 sector-specific demand forecasts
- “2020 Deliveries” applies EIA-176 reported sector delivery breakdown, specific to selected company

## Custom Demand Criteria

| User Input          | Annual Demand   |
|---------------------|-----------------|
| Gas Unit            | MMBtu           |
| Demand Breakdown    | Sector-Specific |
| Sector Demand Share | 2020 Deliveries |

All user-defined cells are orange

## Custom Upstream Natural Gas Emission Factors

- Apply user-defined emission factors (CO<sub>2</sub>, CH<sub>4</sub>, and/or N<sub>2</sub>O) for natural gas value chain segments upstream of transmission (production, gathering & boosting, and processing)
- Input emission factors must be in units of kilogram per delivered MMBtu

All user-defined cells are orange

**User Inputs for Upstream Segments**

[Back to Dashboard](#) [Reset upstream EF ▼](#) [Reset](#)

**User-Defined Upstream Segment Emission Factors**

Use the following inputs to apply custom emission factors for the production, gathering & boosting, and/or processing segments of the natural gas value chain. These custom emission factors may be applied if the user has additional insight into the origin of gas. If the user is an LDC and purchases certified gas, for instance, this worksheet enables the application of producer-specific data.

**Production**

#### User-Defined RNG/Biomethane and Hydrogen Inputs

Use the following inputs to apply custom emission factors for RNG/biomethane feedstocks and hydrogen production. These custom emission factors may be applied if the user has additional insight into the origin of RNG/biomethane or hydrogen. If the user is an LDC and purchases RNG/biomethane/hydrogen from a particular project, for instance, this worksheet enables the application of project-specific data.

##### RNG/Biomethane Assumptions

Production EF

Emission Factors (kg/MMBtu; supply-weighted average through 2050)

|         | CO2  | CH4    | N2O       |
|---------|------|--------|-----------|
| Current | 9.40 | -0.910 | -0.004416 |
| Custom  | 7.20 | -1.240 | -0.006273 |
| Applied | 7.20 | -1.240 | -0.006273 |

##### Hydrogen Assumptions

H2 Origin   
Default = SMR

Production Emission Factors (kg/MMBtu; supply-weighted average through 2050)

|         | CO2   | CH4   | N2O      |
|---------|-------|-------|----------|
| Current | 42.30 | 0.064 | 0.002038 |
| Custom  | 42.30 | 0.064 | 0.002038 |
| Applied | 42.30 | 0.064 | 0.002038 |

##### RNG/Biomethane End-Use Customer Type(s)

Customer type(s) to which RNG/biomethane is delivered

| Delivered to End-Use Sector? |                                  |
|------------------------------|----------------------------------|
| Residential/Commercial       | <input type="text" value="Yes"/> |
| Industrial                   | <input type="text" value="Yes"/> |
| Power                        | <input type="text" value="Yes"/> |
| Transportation/Other         | <input type="text" value="Yes"/> |

##### Hydrogen End-Use Customer Type(s)

Customer type(s) to which hydrogen is delivered

| Delivered to End-Use Sector? |                                  |
|------------------------------|----------------------------------|
| Residential/Commercial       | <input type="text" value="Yes"/> |
| Industrial                   | <input type="text" value="Yes"/> |
| Power                        | <input type="text" value="Yes"/> |
| Transportation/Other         | <input type="text" value="Yes"/> |

## RNG/Biomethane & Hydrogen End-Use Customer Type(s)

- Define the end-use sectors to which RNG/biomethane and hydrogen can be delivered

# Summary of Results: Tool Dashboard Charts

## Discount Rate

- Select data source of social cost of carbon values
- Select discount rate applied to social cost of carbon values

## Analysis Year

- Define analysis year for annual results specific to selection

## Social Cost Savings

- Summary of annual and cumulative social cost savings of scenario (relative to BAU)

## Annual LCA Emissions

- Analysis year emissions of BAU and applied scenario

## Impact of Strategies

- Emission reductions and effect on fossil gas demand, by strategy

## Energy Demand

- Forecasted gas (fossil+decarbonized) demand of selected company, by sector

**Annual Life Cycle Emissions (million metric ton CO2e, MMTCO2e)**

|      | BAU    | Scenario | Change | % Change |
|------|--------|----------|--------|----------|
| 2030 | 137.06 | 100.93   | -36.13 | -26.4%   |
| 2040 | 131.38 | 82.18    | -49.20 | -37.5%   |
| 2050 | 137.75 | 60.25    | -77.50 | -56.3%   |

| Annual Impact of Strategies in 2030 |                 |           | % Change (2030 vs. 2020) |             |
|-------------------------------------|-----------------|-----------|--------------------------|-------------|
|                                     | Strategy        | MMTCO2e Δ | NG Demand Δ              | Emissions Δ |
| Company Upgrades                    | Total           | -2.21     |                          | -1.6%       |
| Demand-Side                         | Efficiency      | -4.21     | -3.1%                    | -3.1%       |
|                                     | Electrification | -7.65     | -6.8%                    | -5.6%       |
|                                     | Power Adj.      | -14.42    | -8.9%                    | -10.5%      |
|                                     | Total           | -26.27    | -18.8%                   | -19.2%      |
| Supply-Side                         | LNG/CNG         | 0.01      | -0.6%                    | 0.0%        |
|                                     | Hydrogen        | -0.17     | -1.6%                    | -0.1%       |
|                                     | Biomethane      | -7.48     | -4.9%                    | -5.5%       |
|                                     | Total           | -7.64     | -7.1%                    | -5.6%       |
| Total Change                        |                 | -36.13    | -25.9%                   | -26.4%      |

## Power Sector Gas Adjustment ("Power Adj.") Considerations

- Electrification results in intersectoral energy demand migration, which impacts power sector energy demand
- Power sector gas demand may increase from demand migration but decrease due to zero-e grid targets; net impact will vary

## LCA Emissions

- GHG emissions by LCA segment and pollutant, by analysis year

## Impact of Strategies

- Emission reductions associated with applied strategies

## Result Tables

### Social Cost of GHG Emissions

- Social cost of emissions, by year
- Social cost savings of applied scenario

### Emission Reduction Strategies

- Emission reductions resulting from applied scenario strategies

### Scenario Emissions

- GHG emissions, by life cycle segment of applied scenario

### BAU Emissions (not shown in screenshot)

- GHG emissions, by life cycle segment of BAU scenario

# Summary of Results: Energy Charts

## Delivered Energy Demand

- Delivered energy, by end-user sector of applied scenario

## Delivered Energy Demand, by Sector

- Delivered energy, by user-defined sector

## Delivered Energy Demand, by Fuel Type

- Delivered energy of applied scenario, by fuel type

## Delivered Energy Demand Reductions, by Strategy

- Delivered energy demand changes resulting from applied scenario strategies

# Summary of Results: Energy Tables

## Result Tables

### Delivered Energy Demand Change Relative to 2020 Baseline, by Strategy

- Delivered energy demand changes resulting from applied scenario strategies

### Delivered Energy Demand, by Fuel Type

- Delivered energy of applied scenario, by fuel type

### Scenario Delivered Energy Demand

- Delivered energy, by end-user sector of applied scenario

### BAU Delivered Energy Demand

- Delivered energy, by end-user sector of BAU scenario
